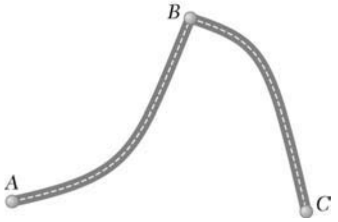
CHAPTER 11



PROBLEM 11.CQ1

A bus travels the 100 miles between *A* and *B* at 50 mi/h and then another 100 miles between *B* and *C* at 70 mi/h. The average speed of the bus for the entire 200-mile trip is:

(*a*) more than 60 mi/h

(*b*) equal to 60 mi/h

(*c*) less than 60 mi/h

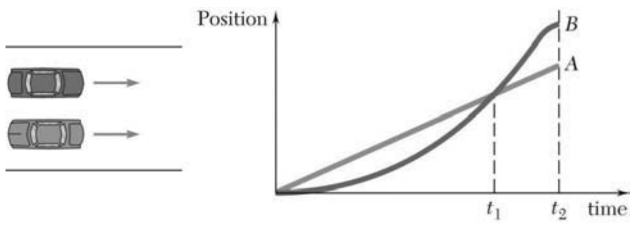
SOLUTION

The time required for the bus to travel from *A* to *B* is 2 h and from *B* to *C* is 100/70 = 1.43 h, so the total time is 3.43 h and the average speed is 200/3.43 = 58 mph.

Answer: (*c*) ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11CQ2



Two cars *A* and *B* race each other down a straight road. The position of each car as a function of time is shown. Which of the following statements are true (more than one answer can be correct)?

(*a*) At time t_2 both cars have traveled the same distance

(*b*) At time t_1 both cars have the same speed

(*c*) Both cars have the same speed at some time $t < t_1$

(*d*) Both cars have the same acceleration at some time $t < t_1$

(*e*) Both cars have the same acceleration at some time $t_1 < t < t_2$

SOLUTION

The speed is the slope of the curve, so answer c) is true.

The acceleration is the second derivative of the position. Since *A*'s position increases linearly the second derivative will always be zero. The second derivative of curve *B* is zero at the pont of inflection which occurs between t_1 and t_2.

Answers: (*c*) and (*e*) ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.1

The motion of a particle is defined by the relation $x = t^4 - 10t^2 + 8t + 12$, where x and t are expressed in inches and seconds, respectively. Determine the position, the velocity, and the acceleration of the particle when $t = 1$ s.

SOLUTION

$$x = t^4 - 10t^2 + 8t + 12$$

$$v = \frac{dx}{dt} = 4t^3 - 20t + 8$$

$$a = \frac{dv}{dt} = 12t^2 - 20$$

At $t = 1\text{ s}$, $x = 1 - 10 + 8 + 12 = 11$ $\qquad x = 11.00\text{ in.}$ ◀

$v = 4 - 20 + 8 = -8$ $\qquad v = -8.00\text{ in./s}$ ◀

$a = 12 - 20 = -8$ $\qquad a = -8.00\text{ in./s}^2$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.2

The motion of a particle is defined by the relation $x = 2t^3 - 9t^2 + 12t + 10,$ where x and t are expressed in feet and seconds, respectively. Determine the time, the position, and the acceleration of the particle when $v = 0.$

SOLUTION

$$x = 2t^3 - 9t^2 + 12t + 10$$

Differentiating,

$$v = \frac{dx}{dt} = 6t^2 - 18t + 12 = 6(t^2 - 3t + 2)$$

$$= 6(t-2)(t-1)$$

$$a = \frac{dv}{dt} = 12t - 18$$

So $v = 0$ at $t = 1\text{ s}$ and $t = 2\text{ s}.$

At $t = 1\text{ s},$

$$x_1 = 2 - 9 + 12 + 10 = 15$$

$$a_1 = 12 - 18 = -6$$

$t = 1.000\text{ s}$ ◀

$x_1 = 15.00\text{ ft}$ ◀

$a_1 = -6.00\text{ ft/s}^2$ ◀

At $t = 2\text{ s},$

$$x_2 = 2(2)^3 - 9(2)^2 + 12(2) + 10 = 14$$

$t = 2.00\text{ s}$ ◀

$x_2 = 14.00\text{ ft}$ ◀

$$a_2 = (12)(2) - 18 = 6$$

$a_2 = 6.00\text{ ft/s}^2$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.3

The vertical motion of mass A is defined by the relation $x = 10\sin 2t + 15\cos 2t + 100$, where x and t are expressed in mm and seconds, respectively. Determine (a) the position, velocity and acceleration of A when $t = 1$ s, (b) the maximum velocity and acceleration of A.

SOLUTION

$$x = 10\sin 2t + 15\cos 2t + 100$$

$$v = \frac{dx}{dt} = 20\cos 2t - 30\sin 2t$$

$$a = \frac{dv}{dt} = -40\sin 2t - 60\cos 2t$$

For trigonometric functions set calculator to radians:

(a) At $t = 1$ s.

$$x_1 = 10\sin 2 + 15\cos 2 + 100 = 102.9 \qquad x_1 = 102.9 \text{ mm} \blacktriangleleft$$

$$v_1 = 20\cos 2 - 30\sin 2 = -35.6 \qquad v_1 = -35.6 \text{ mm/s} \blacktriangleleft$$

$$a_1 = -40\sin 2 - 60\cos 2 = -11.40 \qquad a_1 = -11.40 \text{ mm/s}^2 \blacktriangleleft$$

(b) Maximum velocity occurs when $a = 0$.

$$-40\sin 2t - 60\cos 2t = 0$$

$$\tan 2t = -\frac{60}{40} = -1.5$$

$$2t = \tan^{-1}(-1.5) = -0.9828 \text{ and } -0.9828 + \pi$$

Reject the negative value. $2t = 2.1588$

$$t = 1.0794 \text{ s}$$

$$t = 1.0794 \text{ s for } v_{max}$$

so

$$v_{max} = 20\cos(2.1588) - 30\sin(2.1588)$$
$$= -36.056 \qquad v_{max} = -36.1 \text{ mm/s} \blacktriangleleft$$

Note that we could have also used

$$v_{max} = \sqrt{20^2 + 30^2} = 36.056$$

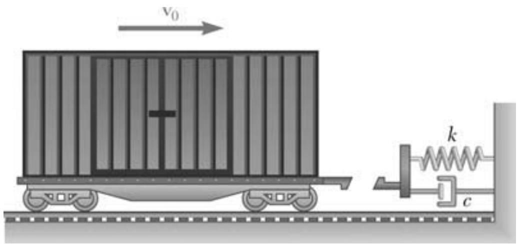
by combining the sine and cosine terms.

For a_{max} we can take the derivative and set equal to zero or just combine the sine and cosine terms.

$$a_{max} = \sqrt{40^2 + 60^2} = 72.1 \text{ mm/s}^2 \qquad a_{max} = 72.1 \text{ mm/s}^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.4



A loaded railroad car is rolling at a constant velocity when it couples with a spring and dashpot bumper system. After the coupling, the motion of the car is defined by the relation $x = 60e^{-4.8t}\sin 16t$ where x and t are expressed in mm and seconds, respectively. Determine the position, the velocity and the acceleration of the railroad car when (*a*) $t = 0$, (*b*) $t = 0.3$ s.

SOLUTION

$$x = 60e^{-4.8t}\sin 16t$$

$$v = \frac{dx}{dt} = 60(-4.8)e^{-4.8t}\sin 16t + 60(16)e^{-4.8t}\cos 16t$$

$$v = -288e^{-4.8t}\sin 16t + 960e^{-4.8t}\cos 16t$$

$$a = \frac{dv}{dt} = 1382.4e^{-4.8t}\sin 16t - 4608e^{-4.8t}\cos 16t$$

$$- 4608e^{-4.8t}\cos 16t - 15360e^{-4.8t}\sin 16t$$

$$a = -13977.6e^{-4.8t}\sin 16t - 9216e^{-4.8}\cos 16t$$

(*a*) At $t = 0$,

$$x_0 = 0 \qquad x_0 = 0 \text{ mm} \blacktriangleleft$$

$$v_0 = 960 \text{ mm/s} \qquad v_0 = 960 \text{ mm/s} \longrightarrow \blacktriangleleft$$

$$a_0 = -9216 \text{ mm/s}^2 \qquad a_0 = 9220 \text{ mm/s}^2 \longleftarrow \blacktriangleleft$$

(*b*) At $t = 0.3$ s,

$$e^{-4.8t} = e^{-1.44} = 0.23692$$

$$\sin 16t = \sin 4.8 = -0.99616$$

$$\cos 16t = \cos 4.8 = 0.08750$$

$$x_{0.3} = (60)(0.23692)(-0.99616) = -14.16 \qquad x_{0.3} = 14.16 \text{ mm} \longleftarrow \blacktriangleleft$$

$$v_{0.3} = -(288)(0.23692)(-0.99616)$$

$$+ (960)(0.23692)(0.08750) = 87.9 \qquad v_{0.3} = 87.9 \text{ mm/s} \longrightarrow \blacktriangleleft$$

$$a_{0.3} = -(13977.6)(0.23692)(-0.99616)$$

$$- (9216)(0.23692)(0.08750) = 3108 \qquad a_{0.3} = 3110 \text{ mm/s}^2 \blacktriangleleft$$

$$\text{or } 3.11 \text{ m/s}^2 \longrightarrow \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.5

The motion of a particle is defined by the relation $x = 6t^4 - 2t^3 - 12t^2 + 3t + 3$, where x and t are expressed in meters and seconds, respectively. Determine the time, the position, and the velocity when $a = 0$.

SOLUTION

We have $$x = 6t^4 - 2t^3 - 12t^2 + 3t + 3$$

Then $$v = \frac{dx}{dt} = 24t^3 - 6t^2 - 24t + 3$$

and $$a = \frac{dv}{dt} = 72t^2 - 12t - 24$$

When $a = 0$: $$72t^2 - 12t - 24 = 12(6t^2 - t - 2) = 0$$

or $$(3t - 2)(2t + 1) = 0$$

or $$t = \frac{2}{3}\text{ s} \quad \text{and} \quad t = -\frac{1}{2}\text{ s} \quad \text{(Reject)}$$

$t = 0.667$ s ◀

At $t = \frac{2}{3}$ s: $$x_{2/3} = 6\left(\frac{2}{3}\right)^4 - 2\left(\frac{2}{3}\right)^3 - 12\left(\frac{2}{3}\right)^2 + 3\left(\frac{2}{3}\right) + 3$$

or $x_{2/3} = 0.259$ m ◀

$$v_{2/3} = 24\left(\frac{2}{3}\right)^3 - 6\left(\frac{2}{3}\right)^2 - 24\left(\frac{2}{3}\right) + 3$$

or $v_{2/3} = -8.56$ m/s ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.6

The motion of a particle is defined by the relation $x = t^3 - 9t^2 + 24t - 8$, where x and t are expressed in inches and seconds, respectively. Determine (a) when the velocity is zero, (b) the position and the total distance traveled when the acceleration is zero.

SOLUTION

We have $\quad x = t^3 - 9t^2 + 24t - 8$

Then $\quad v = \dfrac{dx}{dt} = 3t^2 - 18t + 24$

and $\quad a = \dfrac{dv}{dt} = 6t - 18$

(a) When $v = 0$: $\quad 3t^2 - 18t + 24 = 3(t^2 - 6t + 8) = 0$

$$(t-2)(t-4) = 0$$

$t = 2.00 \text{ s} \quad \text{and} \quad t = 4.00 \text{ s}$ ◀

(b) When $a = 0$: $\quad 6t - 18 = 0 \quad \text{or} \quad t = 3 \text{ s}$

At $t = 3$ s: $\quad x_3 = (3)^3 - 9(3)^2 + 24(3) - 8 \quad$ or $\quad x_3 = 10.00$ in. ◀

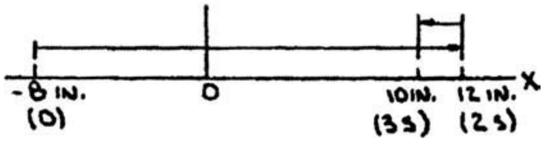
First observe that $0 \le t < 2$ s: $\quad v > 0$

$2 \text{ s} < t \le 3$ s: $\quad v < 0$

Now

At $t = 0$: $\quad x_0 = -8$ in.

At $t = 2$ s: $\quad x_2 = (2)^3 - 9(2)^2 + 24(2) - 8 = 12$ in.



Then $\quad x_2 - x_0 = 12 - (-8) = 20$ in.

$$|x_3 - x_2| = |10 - 12| = 2 \text{ in.}$$

Total distance traveled $= (20 + 2)$ in. $\quad$ Total distance $= 22.0$ in. ◀

PROBLEM 11.7

The motion of a particle is defined by the relation $x = 2t^3 - 15t^2 + 24t + 4$, where x is expressed in meters and t in seconds. Determine (a) when the velocity is zero, (b) the position and the total distance traveled when the acceleration is zero.

SOLUTION

$$x = 2t^3 - 15t^2 + 24t + 4$$

$$v = \frac{dx}{dt} = 6t^2 - 30t + 24$$

$$a = \frac{dv}{dt} = 12t - 30$$

(a) $\underline{v = 0 \text{ when}}$ $\quad 6t^2 - 30t + 24 = 0$

$6(t-1)(t-4) = 0$ $\qquad t = 1.000 \text{ s}$ and $t = 4.00 \text{ s}$ ◀

(b) $\underline{a = 0 \text{ when}}$ $\quad 12t - 30 = 0 \qquad t = 2.5 \text{ s}$

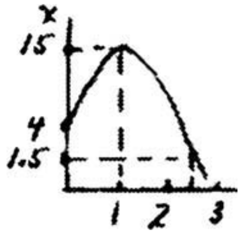
For $t = 2.5$ s: $\quad x_{2.5} = 2(2.5)^3 - 15(2.5)^2 + 24(2.5) + 4$

$x_{2.5} = +1.500 \text{ m}$ ◀

To find total distance traveled, we note that

$\underline{v = 0 \text{ when } t = 1 \text{ s}}$: $\quad x_1 = 2(1)^3 - 15(1)^2 + 24(1) + 4$

$x_1 = +15 \text{ m}$



For $t = 0$, $\quad x_0 = +4 \text{ m}$

Distance traveled

From $t = 0$ to $t = 1$ s: $\quad x_1 - x_0 = 15 - 4 = 11 \text{ m} \longrightarrow$

From $t = 1$ s to $t = 2.5$ s: $\quad x_{2.5} - x_1 = 1.5 - 15 = 13.5 \text{ m} \longleftarrow$

Total distance traveled $= 11 \text{ m} + 13.5 \text{ m}$ $\qquad$ Total distance $= 24.5 \text{ m}$ ◀

PROBLEM 11.8

The motion of a particle is defined by the relation $x = t^3 - 6t^2 - 36t - 40$, where x and t are expressed in feet and seconds, respectively. Determine (a) when the velocity is zero, (b) the velocity, the acceleration, and the total distance traveled when $x = 0$.

SOLUTION

We have $$x = t^3 - 6t^2 - 36t - 40$$

Then $$v = \frac{dx}{dt} = 3t^2 - 12t - 36$$

and $$a = \frac{dv}{dt} = 6t - 12$$

(a) When $v = 0$: $$3t^2 - 12t - 36 = 3(t^2 - 4t - 12) = 0$$

or $$(t+2)(t-6) = 0$$

or $t = -2$ s (Reject) and $t = 6$ s $\quad t = 6.00 \text{ s}$ ◀

(b) When $x = 0$: $$t^3 - 6t^2 - 36t - 40 = 0$$

Factoring $(t-10)(t+2)(t+2) = 0$ or $t = 10$ s

Now observe that $0 \le t < 6$ s: $v < 0$

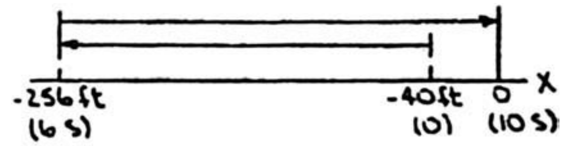
$6 \text{ s} < t \le 10$ s: $v > 0$

and at $t = 0$: $x_0 = -40$ ft

$t = 6$ s: $$x_6 = (6)^3 - 6(6)^2 - 36(6) - 40$$ $$= -256 \text{ ft}$$

$t = 10$ s: $v_{10} = 3(10)^2 - 12(10) - 36$ $\quad$ or $v_{10} = 144.0 \text{ ft/s}$ ◀

$a_{10} = 6(10) - 12$ $\quad$ or $a_{10} = 48.0 \text{ ft/s}^2$ ◀



Then $$|x_6 - x_0| = |-256 - (-40)| = 216 \text{ ft}$$ $$x_{10} - x_6 = 0 - (-256) = 256 \text{ ft}$$

Total distance traveled $= (216 + 256)$ ft $\quad$ Total distance $= 472$ ft ◀

PROBLEM 11.10

The acceleration of a particle is directly proportional to the time *t*. At $t = 0$, the velocity of the particle is $v = 16$ in./s. Knowing that $v = 15$ in./s and that $x = 20$ in. when $t = 1$ s, determine the velocity, the position, and the total distance traveled when $t = 7$ s.

SOLUTION

We have $$a = kt \quad k = \text{constant}$$

Now $$\frac{dv}{dt} = a = kt$$

At $t = 0, v = 16$ in./s: $$\int_{16}^{v} dv = \int_{0}^{t} kt\, dt$$

or $$v - 16 = \frac{1}{2}kt^2$$

or $$v = 16 + \frac{1}{2}kt^2 \text{(in./s)}$$

At $t = 1$ s, $v = 15$ in./s: $$15 \text{ in./s} = 16 \text{ in./s} + \frac{1}{2}k(1\text{ s})^2$$

or $$k = -2 \text{ in./s}^3 \quad \text{and} \quad v = 16 - t^2$$

Also $$\frac{dx}{dt} = v = 16 - t^2$$

At $t = 1$ s, $x = 20$ in.: $$\int_{20}^{x} dx = \int_{1}^{t} (16 - t^2)dt$$

or $$x - 20 = \left[16t - \frac{1}{3}t^3\right]_1^t$$

or $$x = -\frac{1}{3}t^3 + 16t + \frac{13}{3} \text{(in.)}$$

Then

At $t = 7$ s: $$v_7 = 16 - (7)^2$$ or $v_7 = -33.0$ in./s ◀

$$x_7 = -\frac{1}{3}(7)^3 + 16(7) + \frac{13}{3}$$ or $x_7 = 2.00$ in. ◀

When $v = 0$: $$16 - t^2 = 0 \quad \text{or} \quad t = 4 \text{ s}$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.11

The acceleration of a particle is directly proportional to the square of the time *t*. When $t = 0$, the particle is at $x = 24$ m. Knowing that at $t = 6$ s, $x = 96$ m and $v = 18$ m/s, express *x* and *v* in terms of *t*.

SOLUTION

We have $$a = kt^2 \quad k = \text{constant}$$

Now $$\frac{dv}{dt} = a = kt^2$$

At $t = 6$ s, $v = 18$ m/s: $$\int_{18}^{v} dv = \int_{6}^{t} kt^2 dt$$

or $$v - 18 = \frac{1}{3}k(t^3 - 216)$$

or $$v = 18 + \frac{1}{3}k(t^3 - 216)(\text{m/s})$$

Also $$\frac{dx}{dt} = v = 18 + \frac{1}{3}k(t^3 - 216)$$

At $t = 0$, $x = 24$ m: $$\int_{24}^{x} dx = \int_{0}^{t} \left[18 + \frac{1}{3}k(t^3 - 216)\right] dt$$

or $$x - 24 = 18t + \frac{1}{3}k\left(\frac{1}{4}t^4 - 216t\right)$$

Now

At $t = 6$ s, $x = 96$ m: $$96 - 24 = 18(6) + \frac{1}{3}k\left[\frac{1}{4}(6)^4 - 216(6)\right]$$

or $$k = \frac{1}{9}\ \text{m/s}^4$$

Then $$x - 24 = 18t + \frac{1}{3}\left(\frac{1}{9}\right)\left(\frac{1}{4}t^4 - 216t\right)$$

or $$x(t) = \frac{1}{108}t^4 + 10t + 24 \quad ◀$$

and $$v = 18 + \frac{1}{3}\left(\frac{1}{9}\right)(t^3 - 216)$$

or $$v(t) = \frac{1}{27}t^3 + 10 \quad ◀$$

PROBLEM 11.12

The acceleration of a particle is defined by the relation $a = kt^2$. (*a*) Knowing that $v = -8$ m/s when $t = 0$ and that $v = +8$ m/s when $t = 2$ s, determine the constant *k*. (*b*) Write the equations of motion, knowing also that $x = 0$ when $t = 2$ s.

SOLUTION

$$a = kt^2 \qquad (1)$$

$$\frac{dv}{dt} = a = kt^2$$

$t = 0,\ v = -8$ m/s and $t = 2$ s, $v = +8$ ft/s

(*a*)

$$\int_{-8}^{8} dv = \int_0^2 kt^2\, dt$$

$$8 - (-8) = \frac{1}{3}k(2)^3 \qquad k = 6.00 \text{ m/s}^4 \blacktriangleleft$$

(*b*) Substituting $k = 6$ m/s^4 into (1)

$$\frac{dv}{dt} = a = 6t^2 \qquad a = 6t^2 \blacktriangleleft$$

$t = 0,\ v = -8$ m/s:

$$\int_{-8}^{v} dv = \int_0^t 6t^2\, dt$$

$$v - (-8) = \frac{1}{3}6(t)^3 \qquad v = 2t^3 - 8 \blacktriangleleft$$

$$\frac{dx}{dt} = v = 2t^3 - 8$$

$t = 2$ s, $x = 0$:

$$\int_0^x dx = \int_2^t (2t^3 - 8)dt; \quad x = \left|\frac{1}{2}t^4 - 8t\right|_2^t$$

$$x = \left[\frac{1}{2}t^4 - 8t\right] - \left[\frac{1}{2}(2)^4 - 8(2)\right]$$

$$x = \frac{1}{2}t^4 - 8t - 8 + 16 \qquad x = \frac{1}{2}t^4 - 8t + 8 \blacktriangleleft$$

PROBLEM 11.13

The acceleration of Point A is defined by the relation $a = -1.8 \sin kt$, where a and t are expressed in m/s^2 and seconds, respectively, and $k = 3$ rad/s. Knowing that $x = 0$ and $v = 0.6$ m/s when $t = 0$, determine the velocity and position of Point A when $t = 0.5$ s.

SOLUTION

Given: $a = -1.8 \sin kt \text{ m/s}^2, \quad v_0 = 0.6 \text{ m/s}, \quad x_0 = 0, \quad k = 3 \text{ rad/s}$

$$v - v_0 = \int_0^t a\,dt = -1.8 \int_0^t \sin kt\,dt = \frac{1.8}{k} \cos kt \Big|_0^t$$

$$v - 0.6 = \frac{1.8}{3}(\cos kt - 1) = 0.6 \cos kt - 0.6$$

Velocity: $v = 0.6 \cos kt \text{ m/s}$

$$x - x_0 = \int_0^t v\,dt = 0.6 \int_0^t \cos kt\,dt = \frac{0.6}{k} \sin kt \Big|_0^t$$

$$x - 0 = \frac{0.6}{3}(\sin kt - 0) = 0.2 \sin kt$$

Position: $x = 0.2 \sin kt \text{ m}$

When $t = 0.5$ s, $kt = (3)(0.5) = 1.5 \text{ rad}$

$v = 0.6 \cos 1.5 = 0.0424 \text{ m/s}$ $\quad v = 42.4 \text{ mm/s}$ ◀

$x = 0.2 \sin 1.5 = 0.1995 \text{ m}$ $\quad x = 199.5 \text{ mm}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.14

The acceleration of Point A is defined by the relation $a = -1.08\sin kt - 1.44\cos kt$, where a and t are expressed in m/s^2 and seconds, respectively, and k = 3 rad/s. Knowing that x = 0.16 m and v = 0.36 m/s when t = 0, determine the velocity and position of Point A when t = 0.5 s.

SOLUTION

Given: $a = -1.08\sin kt - 1.44\cos kt \text{ m/s}^2, \qquad k = 3 \text{ rad/s}$

$$x_0 = 0.16 \text{ m}, \qquad v_0 = 0.36 \text{ m/s}$$

$$v - v_0 = \int_0^t a\,dt = -1.08\int_0^t \sin kt\,dt - 1.44\int_0^t \cos kt\,dt$$

$$v - 0.36 = \frac{1.08}{k}\cos kt\Big|_0^t - \frac{1.44}{k}\sin kt\Big|_0^t$$

$$= \frac{1.08}{3}(\cos kt - 1) - \frac{1.44}{3}(\sin kt - 0)$$

$$= 0.36\cos kt - 0.36 - 0.48\sin kt$$

Velocity: $v = 0.36\cos kt - 0.48\sin kt \text{ m/s}$

$$x - x_0 = \int_0^t v\,dt = 0.36\int_0^t \cos kt\,dt - 0.48\int_0^t \sin kt\,dt$$

$$x - 0.16 = \frac{0.36}{k}\sin kt\Big|_0^t + \frac{0.48}{k}\cos kt\Big|_0^t$$

$$= \frac{0.36}{3}(\sin kt - 0) + \frac{0.48}{3}(\cos kt - 1)$$

$$= 0.12\sin kt + 0.16\cos kt - 0.16$$

Position: $x = 0.12\sin kt + 0.16\cos kt \text{ m}$

When $t = 0.5$ s, $kt = (3)(0.5) = 1.5$ rad

$v = 0.36\cos 1.5 - 0.48\sin 1.5 = -0.453$ m/s $\qquad v = -453$ mm/s ◀

$x = 0.12\sin 1.5 + 0.16\cos 1.5 = 0.1310$ m $\qquad x = 131.0$ mm ◀

PROBLEM 11.15

A piece of electronic equipment that is surrounded by packing material is dropped so that it hits the ground with a speed of 4 m/s. After contact the equipment experiences an acceleration of $a = -kx$, where k is a constant and x is the compression of the packing material. If the packing material experiences a maximum compression of 20 mm, determine the maximum acceleration of the equipment.

SOLUTION

$$a = \frac{v\,dv}{dx} = -kx$$

Separate and integrate.

$$\int_{v_0}^{v_f} v\,dv = -\int_0^{x_f} kx\,dx$$

$$\frac{1}{2}v_f^2 - \frac{1}{2}v_0^2 = -\frac{1}{2}kx^2\Big|_0^{x_f} = -\frac{1}{2}kx_f^2$$

Use $v_0 = 4$ m/s, $x_f = 0.02$ m, and $v_f = 0$. Solve for k.

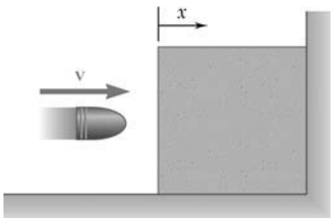
$$0 - \frac{1}{2}(4)^2 = -\frac{1}{2}k(0.02)^2 \qquad k = 40{,}000\ \text{s}^{-2}$$

Maximum acceleration.

$$a_{max} = -kx_{max}: \quad (-40{,}000)(0.02) = -800\ \text{m/s}^2$$

$a = 800\ \text{m/s}^2 \uparrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.16

A projectile enters a resisting medium at $x = 0$ with an initial velocity $v_0 = 900$ ft/s and travels 4 in. before coming to rest. Assuming that the velocity of the projectile is defined by the relation $v = v_0 - kx$, where v is expressed in ft/s and x is in feet, determine (*a*) the initial acceleration of the projectile, (*b*) the time required for the projectile to penetrate 3.9 in. into the resisting medium.

SOLUTION

First note

When $x = \frac{4}{12}$ ft, $v = 0$: $$0 = (900 \text{ ft/s}) - k\left(\frac{4}{12} \text{ ft}\right)$$

or $$k = 2700 \frac{1}{\text{s}}$$

(*a*) We have $$v = v_0 - kx$$

Then $$a = \frac{dv}{dt} = \frac{d}{dt}(v_0 - kx) = -kv$$

or $$a = -k(v_0 - kx)$$

At $t = 0$: $$a = 2700 \frac{1}{\text{s}}(900 \text{ ft/s} - 0)$$

or $$a_0 = -2.43 \times 10^6 \text{ ft/s}^2 \blacktriangleleft$$

(*b*) We have $$\frac{dx}{dt} = v = v_0 - kx$$

At $t = 0, x = 0$: $$\int_0^x \frac{dx}{v_0 - kx} = \int_0^t dt$$

or $$-\frac{1}{k}[\ln(v_0 - kx)]_0^x = t$$

or $$t = \frac{1}{k}\ln\left(\frac{v_0}{v_0 - kx}\right) = \frac{1}{k}\ln\left(\frac{1}{1 - \frac{k}{v_0}x}\right)$$

When $x = 3.9$ in.: $$t = \frac{1}{2700 \frac{1}{\text{s}}}\ln\left[\frac{1}{1 - \frac{2700 \text{ 1/s}}{900 \text{ ft/s}}\left(\frac{3.9}{12} \text{ ft}\right)}\right]$$

or $$t = 1.366 \times 10^{-3} \text{ s} \blacktriangleleft$$

PROBLEM 11.17

The acceleration of a particle is defined by the relation $a = -k/x$. It has been experimentally determined that $v = 15$ ft/s when $x = 0.6$ ft and that $v = 9$ ft/s when $x = 1.2$ ft. Determine (*a*) the velocity of the particle when $x = 1.5$ ft, (*b*) the position of the particle at which its velocity is zero.

SOLUTION

$$a = \frac{v\,dv}{dx} = \frac{-k}{x}$$

Separate and integrate using $x = 0.6$ ft, $v = 15$ ft/s.

$$\int_{15}^{v} v\,dv = -k\int_{0.6}^{x} \frac{dx}{x}$$

$$\frac{1}{2}v^2\Big|_{15}^{v} = -k\ln x\Big|_{0.6}^{x}$$

$$\frac{1}{2}v^2 - \frac{1}{2}(15)^2 = -k\ln\left(\frac{x}{0.6}\right) \qquad (1)$$

When $v = 9$ ft/s, $x = 1.2$ ft

$$\frac{1}{2}(9)^2 - \frac{1}{2}(15)^2 = -k\ln\left(\frac{1.2}{0.6}\right)$$

Solve for *k*.

$$k = 103.874 \text{ ft}^2/\text{s}^2$$

(*a*) Velocity when $x = 65$ ft.

Substitute $k = 103.874 \text{ ft}^2/\text{s}^2$ and $x = 1.5$ ft into (1).

$$\frac{1}{2}v^2 - \frac{1}{2}(15)^2 = -103.874\ln\left(\frac{1.5}{0.6}\right)$$

$v = 5.89$ ft/s ◀

(*b*) Position when for $v = 0$,

$$0 - \frac{1}{2}(15)^2 = -103.874\ln\left(\frac{x}{0.6}\right)$$

$$\ln\left(\frac{x}{0.6}\right) = 1.083$$

$x = 1.772$ ft ◀

PROBLEM 11.18

A brass (nonmagnetic) block *A* and a steel magnet *B* are in equilibrium in a brass tube under the magnetic repelling force of another steel magnet *C* located at a distance $x = 0.004$ m from *B*. The force is inversely proportional to the square of the distance between *B* and *C*. If block *A* is suddenly removed, the acceleration of block *B* is $a = -9.81 + k/x^2$, where a and x are expressed in m/s^2 and m, respectively, and $k = 4\times10^{-4}\,\text{m}^3/\text{s}^2$. Determine the maximum velocity and acceleration of *B*.

SOLUTION

The maximum veolocity occurs when $a = 0$. $\qquad 0 = -9.81 + \dfrac{k}{x_m^2}$

$$x_m^2 = \frac{k}{9.81} = \frac{4\times10^{-4}}{9.81} = 40.775\times10^{-6}\,\text{m}^2 \qquad x_m = 0.0063855\ \text{m}$$

The acceleration is given as a function of x.

$$v\frac{dv}{dx} = a = -9.81 + \frac{k}{x^2}$$

Separate variables and integrate:

$$vdv = -9.81dx + \frac{k\,dx}{x^2}$$

$$\int_0^v vdv = -9.81\int_{x_0}^x dx + k\int_{x_0}^x \frac{dx}{x^2}$$

$$\frac{1}{2}v^2 = -9.81(x - x_0) - k\left(\frac{1}{x} - \frac{1}{x_0}\right)$$

$$\frac{1}{2}v_m^2 = -9.81(x_m - x_0) - k\left(\frac{1}{x_m} - \frac{1}{x_0}\right)$$

$$= -9.81(0.0063855 - 0.004) - (4\times10^{-4})\left(\frac{1}{0.0063855} - \frac{1}{0.004}\right)$$

$$= -0.023402 + 0.037358 = 0.013956\ \text{m}^2/\text{s}^2$$

Maximum velocity: $\qquad v_m = 0.1671\ \text{m/s} \qquad\qquad v_m = 167.1\ \text{mm/s}\ \uparrow$ ◀

The maximum acceleration occurs when x is smallest, that is, $x = 0.004$ m.

$$a_m = -9.81 + \frac{4\times10^{-4}}{(0.004)^2} \qquad\qquad a_m = 15.19\ \text{m/s}^2\ \uparrow$$ ◀

PROBLEM 11.19

Based on experimental observations, the acceleration of a particle is defined by the relation $a = -(0.1 + \sin x/b)$, where a and x are expressed in m/s^2 and meters, respectively. Knowing that $b = 0.8$ m and that $v = 1$ m/s when $x = 0$, determine (a) the velocity of the particle when $x = -1$ m, (b) the position where the velocity is maximum, (c) the maximum velocity.

SOLUTION

We have
$$v\frac{dv}{dx} = a = -\left(0.1 + \sin\frac{x}{0.8}\right)$$

When $x = 0, v = 1$ m/s:
$$\int_1^v v\,dv = \int_0^x -\left(0.1 + \sin\frac{x}{0.8}\right)dx$$

or
$$\frac{1}{2}(v^2 - 1) = -\left[0.1x - 0.8\cos\frac{x}{0.8}\right]_0^x$$

or
$$\frac{1}{2}v^2 = -0.1x + 0.8\cos\frac{x}{0.8} - 0.3$$

(a) When $x = -1$ m:
$$\frac{1}{2}v^2 = -0.1(-1) + 0.8\cos\frac{-1}{0.8} - 0.3$$

or $\qquad v = \pm 0.323$ m/s ◀

(b) When $v = v_{max}$, $a = 0$:
$$-\left(0.1 + \sin\frac{x}{0.8}\right) = 0$$

or $\qquad x = -0.080\,134$ m $\qquad x = -0.0801$ m ◀

(c) When $x = -0.080\,134$ m:
$$\frac{1}{2}v_{max}^2 = -0.1(-0.080\,134) + 0.8\cos\frac{-0.080\,134}{0.8} - 0.3$$
$$= 0.504\ m^2/s^2$$

or $\qquad v_{max} = 1.004$ m/s ◀

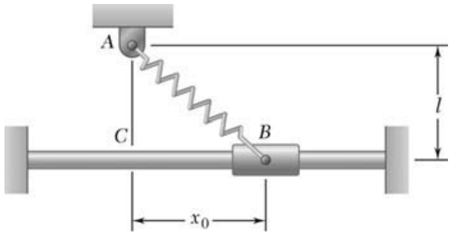
PROBLEM 11.20



A spring AB is attached to a support at A and to a collar. The unstretched length of the spring is l. Knowing that the collar is released from rest at $x = x_0$ and has an acceleration defined by the relation $a = -100(x - lx/\sqrt{l^2 + x^2})$, determine the velocity of the collar as it passes through Point C.

SOLUTION

Since a is function of x,

$$a = v\frac{dv}{dx} = -100\left(x - \frac{lx}{\sqrt{l^2 + x^2}}\right)$$

Separate variables and integrate:

$$\int_{v_0}^{v_f} v\,dv = -100\int_{x_0}^{0}\left(x - \frac{lx}{\sqrt{l^2 + x^2}}\right)dx$$

$$\frac{1}{2}v_f^2 - \frac{1}{2}v_0^2 = -100\left(\frac{x^2}{2} - l\sqrt{l^2 + x^2}\right)\Bigg|_{x_0}^{0}$$

$$\frac{1}{2}v_f^2 - 0 = -100\left(-\frac{x_0^2}{2} - l^2 + l\sqrt{l^2 + x_0^2}\right)$$

$$\frac{1}{2}v_f^2 = \frac{100}{2}(-l^2 + x_0^2 - l^2 - 2l\sqrt{l^2 + x_0^2})$$

$$= \frac{100}{2}(\sqrt{l^2 + x_0^2} - l)^2$$

$$v_f = 10(\sqrt{l^2 + x_0^2} - l) \blacktriangleleft$$

PROBLEM 11.24

The acceleration of a particle is defined by the relation $a = -k\sqrt{v}$, where k is a constant. Knowing that $x = 0$ and $v = 81$ m/s at $t = 0$ and that $v = 36$ m/s when $x = 18$ m, determine (a) the velocity of the particle when $x = 20$ m, (b) the time required for the particle to come to rest.

SOLUTION

(a) We have

$$v\frac{dv}{dx} = a = -k\sqrt{v}$$

so that

$$\sqrt{v}\, dv = -k\,dx$$

When $x = 0, v = 81$ m/s:

$$\int_{81}^{v} \sqrt{v}\, dv = \int_{0}^{x} -k\,dx$$

or

$$\frac{2}{3}[v^{3/2}]_{81}^{v} = -kx$$

or

$$\frac{2}{3}[v^{3/2} - 729] = -kx$$

When $x = 18$ m, $v = 36$ m/s:

$$\frac{2}{3}(36^{3/2} - 729) = -k(18)$$

or

$$k = 19\sqrt{\text{m/s}^2}$$

Finally

When $x = 20$ m:

$$\frac{2}{3}(v^{3/2} - 729) = -19(20)$$

or

$$v^{3/2} = 159$$

$v = 29.3$ m/s ◀

(b) We have

$$\frac{dv}{dt} = a = -19\sqrt{v}$$

At $t = 0, v = 81$ m/s:

$$\int_{81}^{v} \frac{dv}{\sqrt{v}} = \int_{0}^{t} -19dt$$

or

$$2[\sqrt{v}]_{81}^{v} = -19t$$

or

$$2(\sqrt{v} - 9) = -19t$$

When $v = 0$:

$$2(-9) = -19t$$

or

$t = 0.947$ s ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.25

A particle is projected to the right from the position $x = 0$ with an initial velocity of 9 m/s. If the acceleration of the particle is defined by the relation $a = -0.6v^{3/2}$, where a and v are expressed in m/s^2 and m/s, respectively, determine (*a*) the distance the particle will have traveled when its velocity is 4 m/s, (*b*) the time when $v = 1$ m/s, (*c*) the time required for the particle to travel 6 m.

SOLUTION

(*a*) We have $$v\frac{dv}{dx} = a = -0.6v^{3/2}$$

When $x = 0,\ v = 9$ m/s: $$\int_9^v v^{-(1/2)}dv = \int_0^x -0.6dx$$

or $$2[v^{1/2}]_9^v = -0.6x$$

or $$x = \frac{1}{0.3}(3 - v^{1/2}) \qquad (1)$$

When $v = 4$ m/s: $$x = \frac{1}{0.3}(3 - 4^{1/2})$$

or $$x = 3.33 \text{ m} \blacktriangleleft$$

(*b*) We have $$\frac{dv}{dt} = a = -0.6v^{3/2}$$

When $t = 0,\ v = 9$ m/s: $$\int_9^v v^{-(3/2)}dv = \int_0^t -0.6dt$$

or $$-2[v^{-(1/2)}]_9^v = -0.6t$$

or $$\frac{1}{\sqrt{v}} - \frac{1}{3} = 0.3t$$

When $v = 1$ m/s: $$\frac{1}{\sqrt{1}} - \frac{1}{3} = 0.3t$$

or $$t = 2.22 \text{ s} \blacktriangleleft$$

(*c*) We have $$\frac{1}{\sqrt{v}} - \frac{1}{3} = 0.3t$$

or $$v = \left(\frac{3}{1 + 0.9t}\right)^2 = \frac{9}{(1 + 0.9t)^2}$$

Now $$\frac{dx}{dt} = v = \frac{9}{(1 + 0.9t)^2}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.25 (Continued)

At $t = 0,\ x = 0$: $$\int_0^x dx = \int_0^t \frac{9}{(1+0.9t)^2}\,dt$$

or $$x = 9\left[-\frac{1}{0.9}\frac{1}{1+0.9t}\right]_0^t$$

$$= 10\left(1 - \frac{1}{1+0.9t}\right)$$

$$= \frac{9t}{1+0.9t}$$

When $x = 6$ m: $$6 = \frac{9t}{1+0.9t}$$

or $$t = 1.667 \text{ s} \blacktriangleleft$$

An alternative solution is to begin with Eq. (1).

$$x = \frac{1}{0.3}(3 - v^{1/2})$$

Then $$\frac{dx}{dt} = v = (3 - 0.3x)^2$$

Now

At $t = 0,\ x = 0$: $$\int_0^x \frac{dx}{(3-0.3x)^2} = \int_0^t dt$$

or $$t = \frac{1}{0.3}\left[\frac{1}{3-0.3x}\right]_0^x = \frac{x}{9-0.9x}$$

which leads to the same equation as above.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.26

The acceleration of a particle is defined by the relation $a = 0.4(1 - kv)$, where k is a constant. Knowing that at $t = 0$ the particle starts from rest at $x = 4$ m and that when $t = 15$ s, $v = 4$ m/s, determine (*a*) the constant k, (*b*) the position of the particle when $v = 6$ m/s, (*c*) the maximum velocity of the particle.

SOLUTION

(*a*) We have $$\frac{dv}{dt} = a = 0.4(1 - kv)$$

At $t = 0,\ v = 0$: $$\int_0^v \frac{dv}{1 - kv} = \int_0^t 0.4dt$$

or $$-\frac{1}{k}[\ln(1 - kv)]_0^v = 0.4t$$

or $$\ln(1 - kv) = -0.4kt \qquad (1)$$

At $t = 15$ s, $v = 4$ m/s: $$\ln(1 - 4k) = -0.4k(15)$$
$$= -6k$$

Solving yields $$k = 0.145703 \text{ s/m}$$

or $k = 0.1457$ s/m ◀

(*b*) We have $$v\frac{dv}{dx} = a = 0.4(1 - kv)$$

When $x = 4$ m, $v = 0$: $$\int_0^v \frac{vdv}{1 - kv} = \int_4^x 0.4dx$$

Now $$\frac{v}{1 - kv} = -\frac{1}{k} + \frac{1/k}{1 - kv}$$

Then $$\int_0^v \left[-\frac{1}{k} + \frac{1}{k(1 - kv)}\right] dv = \int_4^x 0.4dx$$

or $$\left[-\frac{v}{k} - \frac{1}{k^2}\ln(1 - kv)\right]_0^v = 0.4[x]_4^x$$

or $$-\left[\frac{v}{k} + \frac{1}{k^2}\ln(1 - kv)\right] = 0.4(x - 4)$$

When $v = 6$ m/s: $$-\left[\frac{6}{0.145\,703} + \frac{1}{(0.145\,703)^2}\ln(1 - 0.145\,703 \times 6)\right] = 0.4(x - 4)$$

or $$0.4(x - 4) = 56.4778$$

or $x = 145.2$ m ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.26 (Continued)

(*c*) The maximum velocity occurs when $a = 0$.

$$a = 0: \quad 0.4(1 - k v_{max}) = 0$$

or

$$v_{max} = \frac{1}{0.145\,703}$$

or

$$v_{max} = 6.86 \text{ m/s} \blacktriangleleft$$

An alternative solution is to begin with Eq. (1).

$$\ln(1 - kv) = -0.4kt$$

Then

$$v = \frac{1}{k}(1 - k^{-0.4kt})$$

Thus, v_{max} is attained as $t \longrightarrow \infty$

$$v_{max} = \frac{1}{k}$$

as above.

PROBLEM 11.27

Experimental data indicate that in a region downstream of a given louvered supply vent the velocity of the emitted air is defined by $v = 0.18v_0/x$, where v and x are expressed in m/s and meters, respectively, and v_0 is the initial discharge velocity of the air. For $v_0 = 3.6$ m/s, determine (a) the acceleration of the air at $x = 2$ m, (b) the time required for the air to flow from $x = 1$ to $x = 3$ m.

SOLUTION

(a) We have

$$a = v\frac{dv}{dx}$$

$$= \frac{0.18v_0}{x}\frac{d}{dx}\left(\frac{0.18v_0}{x}\right)$$

$$= -\frac{0.0324v_0^2}{x^3}$$

When $x = 2$ m:

$$a = -\frac{0.0324(3.6)^2}{(2)^3}$$

or $a = -0.0525 \text{ m/s}^2$ ◀

(b) We have

$$\frac{dx}{dt} = v = \frac{0.18v_0}{x}$$

From $x = 1$ m to $x = 3$ m:

$$\int_1^3 x\,dx = \int_{t_1}^{t_3} 0.18v_0\,dt$$

or

$$\left[\frac{1}{2}x^2\right]_1^3 = 0.18v_0(t_3 - t_1)$$

or

$$(t_3 - t_1) = \frac{\frac{1}{2}(9-1)}{0.18(3.6)}$$

or $t_3 - t_1 = 6.17$ s ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.29

The acceleration due to gravity at an altitude y above the surface of the earth can be expressed as

$$a = \frac{-32.2}{[1 + (y/20.9 \times 10^6)]^2}$$

where a and y are expressed in ft/s^2 and feet, respectively. Using this expression, compute the height reached by a projectile fired vertically upward from the surface of the earth if its initial velocity is (*a*) 1800 ft/s, (*b*) 3000 ft/s, (*c*) 36,700 ft/s.

SOLUTION

We have $$v\frac{dv}{dy} = a = -\frac{32.2}{\left(1 + \frac{y}{20.9\times 10^6}\right)^2}$$

When $$y = 0, \qquad v = v_0$$

provided that v does reduce to zero, $$y = y_{\max}, \quad v = 0$$

Then $$\int_{v_0}^{0} v\,dv = \int_0^{y_{\max}} \frac{-32.2}{\left(1 + \frac{y}{20.9\times 10^6}\right)^2} dy$$

or $$-\frac{1}{2}v_0^2 = -32.2\left[-20.9\times 10^6 \frac{1}{1 + \frac{y}{20.9\times 10^6}}\right]_0^{y_{\max}}$$

or $$v_0^2 = 1345.96\times 10^6 \left(1 - \frac{1}{1 + \frac{y_{\max}}{20.9\times 10^6}}\right)$$

or $$y_{\max} = \frac{v_0^2}{64.4 - \frac{v_0^2}{20.9\times 10^6}}$$

(*a*) $v_0 = 1800$ ft/s: $$y_{\max} = \frac{(1800)^2}{64.4 - \frac{(1800)^2}{20.9\times 10^6}}$$

or $$y_{\max} = 50.4\times 10^3 \text{ ft} \blacktriangleleft$$

(*b*) $v_0 = 3000$ ft/s: $$y_{\max} = \frac{(3000)^2}{64.4 - \frac{(3000)^2}{20.9\times 10^6}}$$

or $$y_{\max} = 140.7\times 10^3 \text{ ft} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

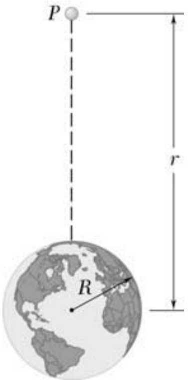
PROBLEM 11.29 (Continued)

(*c*) $v_0 = 36,700$ ft/s: $$y_{max} = \frac{(36,700)^2}{64.4 - \frac{(36,700)^2}{20.9\times 10^6}} = -3.03\times 10^{10} \text{ ft}$$

This solution is invalid since the velocity does not reduce to zero. The velocity 36,700 ft/s is above the escape velocity v_R from the earth. For v_R and above.

$$y_{max} \longrightarrow \infty \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.30

The acceleration due to gravity of a particle falling toward the earth is $a = -gR^2/r^2$, where r is the distance from the *center* of the earth to the particle, R is the radius of the earth, and g is the acceleration due to gravity at the surface of the earth. If $R = 3960$ mi, calculate the *escape velocity,* that is, the minimum velocity with which a particle must be projected vertically upward from the surface of the earth if it is not to return to the earth. (*Hint:* $v = 0$ for $r = \infty$.)

SOLUTION

We have $$v\frac{dv}{dr} = a = -\frac{gR^2}{r^2}$$

When $$r = R, \quad v = v_e$$
$$r = \infty, \quad v = 0$$

then $$\int_{v_e}^{0} v\,dv = \int_R^\infty -\frac{gR^2}{r^2}\,dr$$

or $$-\frac{1}{2}v_e^2 = gR^2\left[\frac{1}{r}\right]_R^\infty$$

or $$v_e = \sqrt{2gR}$$
$$= \left(2 \times 32.2 \text{ ft/s}^2 \times 3960 \text{ mi} \times \frac{5280 \text{ ft}}{1 \text{ mi}}\right)^{1/2}$$

or $$v_e = 36.7 \times 10^3 \text{ ft/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.31

The velocity of a particle is $v = v_0[1 - \sin(\pi t/T)]$. Knowing that the particle starts from the origin with an initial velocity v_0, determine (*a*) its position and its acceleration at $t = 3T$, (*b*) its average velocity during the interval $t = 0$ to $t = T$.

SOLUTION

(*a*) We have $$\frac{dx}{dt} = v = v_0\left[1 - \sin\left(\frac{\pi t}{T}\right)\right]$$

At $t = 0, x = 0$: $$\int_0^x dx = \int_0^t v_0\left[1 - \sin\left(\frac{\pi t}{T}\right)\right]dt$$

$$x = v_0\left[t + \frac{T}{\pi}\cos\left(\frac{\pi t}{T}\right)\right]_0^t = v_0\left[t + \frac{T}{\pi}\cos\left(\frac{\pi t}{T}\right) - \frac{T}{\pi}\right] \qquad (1)$$

At $t = 3T$: $$x_{3T} = v_0\left[3T + \frac{T}{\pi}\cos\left(\frac{\pi \times 3T}{T}\right) - \frac{T}{\pi}\right] = v_0\left(3T - \frac{2T}{\pi}\right)$$ $x_{3T} = 2.36\, v_0 T$ ◀

$$a = \frac{dv}{dt} = \frac{d}{dt}\left\{v_0\left[1 - \sin\left(\frac{\pi t}{T}\right)\right]\right\} = -v_0\frac{\pi}{T}\cos\frac{\pi t}{T}$$

At $t = 3T$: $$a_{3T} = -v_0\frac{\pi}{T}\cos\frac{\pi \times 3T}{T}$$ $a_{3T} = \dfrac{\pi v_0}{T}$ ◀

(*b*) Using Eq. (1)

At $t = 0$: $$x_0 = v_0\left[0 + \frac{T}{\pi}\cos(0) - \frac{T}{\pi}\right] = 0$$

At $t = T$: $$x_T = v_0\left[T + \frac{T}{\pi}\cos\left(\frac{\pi T}{T}\right) - \frac{T}{\pi}\right] = v_0\left(T - \frac{2T}{\pi}\right) = 0.363 v_0 T$$

Now $$v_{ave} = \frac{x_T - x_0}{\Delta t} = \frac{0.363 v_0 T - 0}{T - 0}$$ $v_{ave} = 0.363 v_0$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

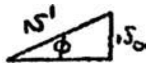
PROBLEM 11.32

The velocity of a slider is defined by the relation $v = v' \sin(\omega_n t + \phi)$. Denoting the velocity and the position of the slider at $t = 0$ by v_0 and x_0, respectively, and knowing that the maximum displacement of the slider is $2x_0$, show that (*a*) $v' = (v_0^2 + x_0^2\omega_n^2)/2x_0\omega_n$, (*b*) the maximum value of the velocity occurs when $x = x_0[3 - (v_0/x_0\omega_n)^2]/2$.

SOLUTION

(*a*) At $t = 0, v = v_0$: $\quad v_0 = v' \sin(0 + \phi) = v' \sin\phi$

Then $\quad \cos\phi = \sqrt{v'^2 - v_0^2}\Big/ v'$



Now $\quad \dfrac{dx}{dt} = v = v' \sin(\omega_n t + \phi)$

At $t = 0, x = x_0$: $\quad \displaystyle\int_{x0}^{x} dx = \int_0^t v' \sin(\omega_n t + \phi)dt$

or
$$x - x_0 = v'\left[-\frac{1}{\omega_n}\cos(\omega_n t + \phi)\right]_0^t$$

or
$$x = x_0 + \frac{v'}{\omega_n}\left[\cos\phi - \cos(\omega_n t + \phi)\right]$$

Now observe that x_{max} occurs when $\cos(\omega_n t + \phi) = -1$. Then

$$x_{max} = 2x_0 = x_0 + \frac{v'}{\omega_n}[\cos\phi - (-1)]$$

Substituting for $\cos\phi$
$$x_0 = \frac{v'}{\omega_n}\left(\frac{\sqrt{v'^2 - v_0^2}}{v^1} + 1\right)$$

or
$$x_0\omega_n - v' = \sqrt{v'^2 - v_0^2}$$

Squaring both sides of this equation

$$x_0^2\omega_n^2 - 2x_0\omega_n + v'^2 = v'^2 - v_0^2$$

or
$$v' = \frac{v_0^2 + x_0^2\omega_n^2}{2x_0\omega_n} \qquad \text{Q. E. D.}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.33

A stone is thrown vertically upward from a point on a bridge located 40 m above the water. Knowing that it strikes the water 4 s after release, determine (*a*) the speed with which the stone was thrown upward, (*b*) the speed with which the stone strikes the water.

SOLUTION

Uniformly accelerated motion. Origin at water. $+\uparrow$

$$y = y_0 + v_0 t + \frac{1}{2} a t^2$$

$$v = v_0 + a t$$

where $y_0 = 40 \text{ m}$ and $a = -9.81 \text{ m/s}^2$.

(*a*) *Initial speed.*

$$y = 0 \text{ when } t = 4 \text{ s.}$$

$$0 = 40 + v_0(4) - \frac{1}{2}(9.81)(4)^2$$

$$v_0 = 9.62 \text{ m/s} \qquad \mathbf{v}_0 = 9.62 \text{ m/s} \uparrow \blacktriangleleft$$

(*b*) *Speed when striking the water.* (v at $t = 4$ s)

$$v = 9.62 - (9.81)(4) = -29.62 \text{ m/s} \qquad \mathbf{v} = 29.6 \text{ m/s} \downarrow \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. 	**PROBLEM 11.34** A motorist is traveling at 54 km/h when she observes that a traffic light 240 m ahead of her turns red. The traffic light is timed to stay red for 24 s. If the motorist wishes to pass the light without stopping just as it turns green again, determine (*a*) the required uniform deceleration of the car, (*b*) the speed of the car as it passes the light.

SOLUTION

Uniformly accelerated motion:

$$x_0 = 0 \quad v_0 = 54 \text{ km/h} = 15 \text{ m/s}$$

(a) $x = x_0 + v_0 t + \frac{1}{2} a t^2$

when $t = 24\text{s}$, $x = 240$ m:

$$240 \text{ m} = 0 + (15 \text{ m/s})(24 \text{ s}) + \frac{1}{2} a (24 \text{ s})^2$$

$$a = -0.4167 \text{ m/s}^2$$

$a = -0.417 \text{ m/s}^2$ ◀

(*b*) $v = v_0 + at$

when $t = 24\text{s}$:

$$v = (15 \text{ m/s}) + (-0.4167 \text{ m/s})(24 \text{ s})$$

$$v = 5.00 \text{ m/s}$$

$$v = 18.00 \text{ km/h}$$

$v = 18.00 \text{ km/h}$ ◀

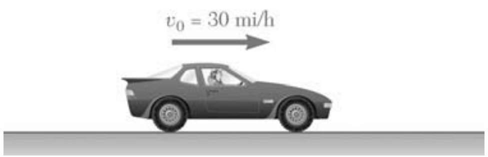
PROBLEM 11.35



A motorist enters a freeway at 30 mi/h and accelerates uniformly to 60 mi/h. From the odometer in the car, the motorist knows that she traveled 550 ft while accelerating. Determine (*a*) the acceleration of the car, (*b*) the time required to reach 60 mi/h.

SOLUTION

(*a*) Acceleration of the car.

$$v_1^2 = v_0^2 + 2a(x_1 - x_0)$$

$$a = \frac{v_1^2 - v_0^2}{2(x_1 - x_0)}$$

Data:

$$v_0 = 30 \text{ mi/h} = 44 \text{ ft/s}$$

$$v_1 = 60 \text{ mi/h} = 88 \text{ ft/s}$$

$$x_0 = 0$$

$$x_1 = 550 \text{ ft}$$

$$a = \frac{(88)^2 - (44)^2}{(2)(55 - 0)} \qquad a = 5.28 \text{ ft/s}^2 \blacktriangleleft$$

(*b*) Time to reach 60 mi/h.

$$v_1 = v_0 + a(t_1 - t_0)$$

$$t_1 - t_0 = \frac{v_1 - v_0}{a}$$

$$= \frac{88 - 44}{5.28}$$

$$= 8.333 \text{ s} \qquad t_1 - t_0 = 8.33 \text{ s} \blacktriangleleft$$

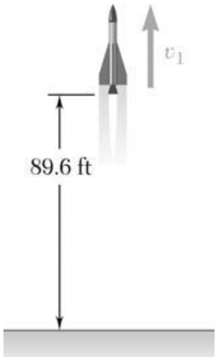
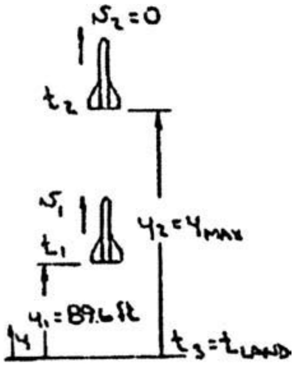
PROBLEM 11.36



A group of students launches a model rocket in the vertical direction. Based on tracking data, they determine that the altitude of the rocket was 89.6 ft at the end of the powered portion of the flight and that the rocket landed 16 s later. Knowing that the descent parachute failed to deploy so that the rocket fell freely to the ground after reaching its maximum altitude and assuming that $g = 32.2 \text{ ft/s}^2$, determine (*a*) the speed v_1 of the rocket at the end of powered flight, (*b*) the maximum altitude reached by the rocket.

SOLUTION



(*a*) We have $y = y_1 + v_1 t + \frac{1}{2}at^2$

At t_{land}, $y = 0$

Then
$$0 = 89.6 \text{ ft} + v_1(16 \text{ s}) + \frac{1}{2}(-32.2 \text{ ft/s}^2)(16 \text{ s})^2$$

or $v_1 = 252 \text{ ft/s}$ ◀

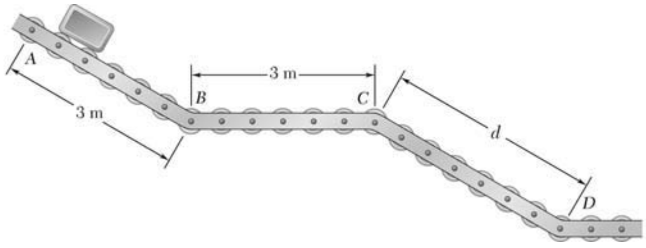
(*b*) We have $v^2 = v_1^2 + 2a(y - y_1)$

At $y = y_{\max}, \quad v = 0$

Then
$$0 = (252 \text{ ft/s})^2 + 2(-32.2 \text{ ft/s}^2)(y_{\max} - 89.6) \text{ ft}$$

or $y_{\max} = 1076 \text{ ft}$ ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.37

A small package is released from rest at A and moves along the skate wheel conveyor $ABCD$. The package has a uniform acceleration of 4.8 m/s^2 as it moves down sections AB and CD, and its velocity is constant between B and C. If the velocity of the package at D is 7.2 m/s, determine (a) the distance d between C and D, (b) the time required for the package to reach D.

SOLUTION

(a) For $A \longrightarrow B$ and $C \longrightarrow D$ we have

$$v^2 = v_0^2 + 2a(x - x_0)$$

Then, at B $\quad v_{BC}^2 = 0 + 2(4.8\text{ m/s}^2)(3 - 0)\text{ m}$

$$= 28.8\text{ m}^2/\text{s}^2 \qquad (v_{BC} = 5.3666\text{ m/s})$$

and at D $\quad v_D^2 = v_{BC}^2 + 2a_{CD}(x_D - x_C) \qquad d = x_D - x_C$

or $\quad (7.2\text{ m/s})^2 = (28.8\text{ m}^2/\text{s}^2) + 2(4.8\text{ m/s}^2)d$

or $\quad d = 2.40\text{ m}$ ◀

(b) For $A \longrightarrow B$ and $C \longrightarrow D$ we have

$$v = v_0 + at$$

Then $A \longrightarrow B$ $\quad 5.3666\text{ m/s} = 0 + (4.8\text{ m/s}^2)t_{AB}$

or $\quad t_{AB} = 1.11804\text{ s}$

and $C \longrightarrow D$ $\quad 7.2\text{ m/s} = 5.3666\text{ m/s} + (4.8\text{ m/s}^2)t_{CD}$

or $\quad t_{CD} = 0.38196\text{ s}$

Now, for $B \longrightarrow C$, we have $\quad x_C = x_B + v_{BC}t_{BC}$

or $\quad 3\text{ m} = (5.3666\text{ m/s})t_{BC}$

or $\quad t_{BC} = 0.55901\text{ s}$

Finally, $\quad t_D = t_{AB} + t_{BC} + t_{CD} = (1.11804 + 0.55901 + 0.38196)\text{ s}$

or $\quad t_D = 2.06\text{ s}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.38

A sprinter in a 100-m race accelerates uniformly for the first 35 m and then runs with constant velocity. If the sprinter's time for the first 35 m is 5.4 s, determine (*a*) his acceleration, (*b*) his final velocity, (*c*) his time for the race.

SOLUTION

Given: $0 \le x \le 35$ m, $a = \text{constant}$

$35 \text{ m} < x \le 100 \text{ m}, \quad v = \text{constant}$

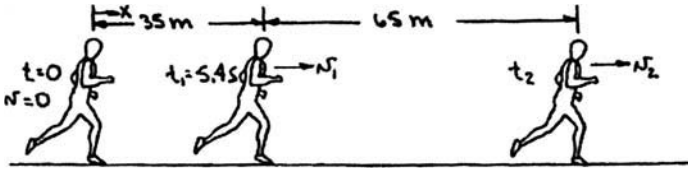
At $t = 0, \quad v = 0 \quad$ when $\quad x = 35 \text{ m}, \quad t = 5.4 \text{ s}$

Find:

(*a*) a

(*b*) v when $x = 100$ m

(*c*) t when $x = 100$ m



(*a*) We have $x = 0 + 0t + \frac{1}{2}at^2 \quad$ for $\quad 0 \le x \le 35$ m

At $t = 5.4$ s: $35 \text{ m} = \frac{1}{2}a(5.4 \text{ s})^2$

or $a = 2.4005 \text{ m/s}^2$

$a = 2.40 \text{ m/s}^2$ ◀

(*b*) First note that $v = v_{\text{max}}$ for $35 \text{ m} \le x \le 100$ m.

Now $v^2 = 0 + 2a(x - 0) \quad$ for $\quad 0 \le x \le 35$ m

When $x = 35$ m: $v_{\text{max}}^2 = 2(2.4005 \text{ m/s}^2)(35 \text{ m})$

or $v_{\text{max}} = 12.9628$ m/s $\qquad v_{\text{max}} = 12.96$ m/s ◀

(*c*) We have $x = x_1 + v_0(t - t_1) \quad$ for $\quad 35 \text{ m} < x \le 100$ m

When $x = 100$ m: $100 \text{ m} = 35 \text{ m} + (12.9628 \text{ m/s})(t_2 - 5.4) \text{ s}$

or $t_2 = 10.41$ s ◀

PROBLEM 11.39

As relay runner A enters the 20-m-long exchange zone with a speed of 12.9 m/s, he begins to slow down. He hands the baton to runner B 1.82 s later as they leave the exchange zone with the same velocity. Determine (*a*) the uniform acceleration of each of the runners, (*b*) when runner B should begin to run.

SOLUTION

(*a*) For runner A: $$x_A = 0 + (v_A)_0 t + \frac{1}{2} a_A t^2$$

At $t = 1.82$ s: $$20 \text{ m} = (12.9 \text{ m/s})(1.82 \text{ s}) + \frac{1}{2} a_A (1.82 \text{ s})^2$$

or $$a_A = -2.10 \text{ m/s}^2 \blacktriangleleft$$

Also $$v_A = (v_A)_0 + a_A t$$

At $t = 1.82$ s: $$(v_A)_{1.82} = (12.9 \text{ m/s}) + (-2.10 \text{ m/s}^2)(1.82 \text{ s})$$
$$= 9.078 \text{ m/s}$$

For runner B: $$v_B^2 = 0 + 2a_B\left[x_B - 0\right]$$

When $$x_B = 20 \text{ m}, \quad v_B = v_A: \quad (9.078 \text{ m/s})^2 = 2a_B (20 \text{ m})$$

or $$a_B = 2.0603 \text{ m/s}^2$$

$$a_B = 2.06 \text{ m/s}^2 \blacktriangleleft$$

(*b*) For runner B: $$v_B = 0 + a_B(t - t_B)$$

where t_B is the time at which he begins to run.

At $t = 1.82$ s: $$9.078 \text{ m/s} = (2.0603 \text{ m/s}^2)(1.82 - t_B) \text{ s}$$

or $$t_B = -2.59 \text{ s}$$

Runner B should start to run 2.59 s before A reaches the exchange zone. ◀

PROBLEM 11.40

In a boat race, boat A is leading boat B by 50 m and both boats are traveling at a constant speed of 180 km/h. At $t = 0$, the boats accelerate at constant rates. Knowing that when B passes A, $t = 8$ s and $v_A = 225$ km/h, determine (*a*) the acceleration of A, (*b*) the acceleration of B.

SOLUTION

(*a*) We have $$v_A = (v_A)_0 + a_A t$$

$$(v_A)_0 = 180 \text{ km/h} = 50 \text{ m/s}$$

At $t = 8$ s: $$v_A = 225 \text{ km/h} = 62.5 \text{ m/s}$$

Then $$62.5 \text{ m/s} = 50 \text{ m/s} + a_A (8 \text{ s})$$

or $$a_A = 1.563 \text{ m/s}^2 \blacktriangleleft$$

(*b*) We have

$$x_A = (x_A)_0 + (v_A)_0 t + \frac{1}{2} a_A t^2 = 50 \text{ m} + (50 \text{ m/s})(8 \text{ s}) + \frac{1}{2}(1.5625 \text{ m/s}^2)(8 \text{ s})^2 = 500 \text{ m}$$

and $$x_B = 0 + (v_B)_0 t + \frac{1}{2} a_B t^2 \qquad (v_B)_0 = 50 \text{ m/s}$$

At $t = 8$ s: $$x_A = x_B$$

$$500 \text{ m} = (50 \text{ m/s})(8 \text{ s}) + \frac{1}{2} a_B (8 \text{ s})^2$$

or $$a_B = 3.13 \text{ m/s}^2 \blacktriangleleft$$

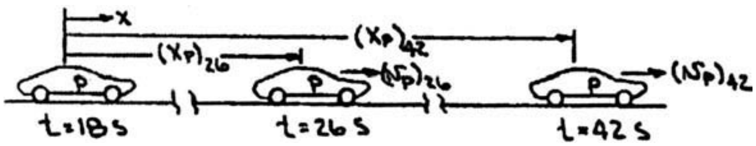
PROBLEM 11.41

A police officer in a patrol car parked in a 45 mi/h speed zone observes a passing automobile traveling at a slow, constant speed. Believing that the driver of the automobile might be intoxicated, the officer starts his car, accelerates uniformly to 60 mi/h in 8 s, and, maintaining a constant velocity of 60 mi/h, overtakes the motorist 42 s after the automobile passed him. Knowing that 18 s elapsed before the officer began pursuing the motorist, determine (*a*) the distance the officer traveled before overtaking the motorist, (*b*) the motorist's speed.

SOLUTION



$(v_P)_{18} = 0 \qquad (v_P)_{26} = 60 \text{ mi/h} = 88 \text{ ft/s} \qquad (v_P)_{42} = 90 \text{ mi/h} = 88 \text{ ft/s}$

(*a*) Patrol car:

For $18 \text{ s} < t \le 26 \text{ s}$: $\quad v_P = 0 + a_P(t - 18)$

At $t = 26$ s: $\quad 88 \text{ ft/s} = a_P(26 - 18) \text{ s}$

or $\quad a_P = 11 \text{ ft/s}^2$

Also, $\quad x_P = 0 + 0(t - 18) - \frac{1}{2}a_P(t - 18)^2$

At $t = 26$ s: $\quad (x_P)_{26} = \frac{1}{2}(11 \text{ ft/s}^2)(26 - 18)^2 = 352 \text{ ft}$

For $26 \text{ s} < t \le 42$ s: $\quad x_P = (x_P)_{26} + (v_P)_{26}(t - 26)$

At $t = 42$ s: $\quad (x_P)_{42} = 352 \text{ m} + (88 \text{ ft/s})(42 - 26) \text{ s}$

$= 1760 \text{ ft}$

$(x_P)_{42} = 1760 \text{ ft}$ ◀

(*b*) For the motorist's car: $\quad x_M = 0 + v_M t$

At $t = 42$ s, $x_M = x_P$: $\quad 1760 \text{ ft} = v_M (42 \text{ s})$

or $\quad v_M = 41.9048 \text{ ft/s}$

or $\quad v_M = 28.6 \text{ mi/h}$ ◀

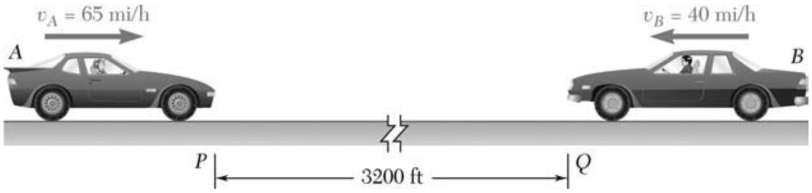
PROBLEM 11.43

Two automobiles A and B are approaching each other in adjacent highway lanes. At $t = 0$, A and B are 3200 ft apart, their speeds are $v_A = 65$ mi/h and $v_B = 40$ mi/h, and they are at Points P and Q, respectively. Knowing that A passes Point Q 40 s after B was there and that B passes Point P 42 s after A was there, determine (*a*) the uniform accelerations of A and B, (*b*) when the vehicles pass each other, (*c*) the speed of B at that time.



SOLUTION

(*a*) We have $$x_A = 0 + (v_A)_0 t + \frac{1}{2} a_A t^2 \quad (v_A)_0 = 65 \text{ mi/h} = 95.33 \text{ ft/s}$$

(x is positive →; origin at P.)

At $t = 40$ s: $$3200 \text{ m} = (95.333 \text{ m/s})(40 \text{ s}) + \frac{1}{2} a_A (40 \text{ s})^2 \qquad a_A = -0.767 \text{ ft/s}^2 \blacktriangleleft$$

Also, $x_B = 0 + (v_B)_0 t + \frac{1}{2} a_B t^2 \quad (v_B)_0 = 40 \text{ mi/h} = 58.667 \text{ ft/s}$

(x_B is positive ←; origin at Q.)

At $t = 42$ s: $$3200 \text{ ft} = (58.667 \text{ ft/s})(42 \text{ s}) + \frac{1}{2} a_B (42 \text{ s})^2$$

or $$a_B = 0.83447 \text{ ft/s}^2 \qquad a_B = 0.834 \text{ ft/s}^2 \blacktriangleleft$$

(*b*) When the cars pass each other $x_A + x_B = 3200$ ft

Then $$(95.333 \text{ ft/s})t_{AB} + \frac{1}{2}(-0.76667 \text{ ft/s})t_{AB}^2 + (58.667 \text{ ft/s})t_{AB} + \frac{1}{2}(0.83447 \text{ ft/s}^2)t_{AB}^2 = 3200 \text{ ft}$$

or $$0.03390 t_{AB}^2 + 154 t_{AB} - 3200 = 0$$

Solving $$t = 20.685 \text{ s} \quad \text{and} \quad t = -4563 \text{ s} \qquad t > 0 \Rightarrow \qquad t_{AB} = 20.7 \text{ s} \blacktriangleleft$$

(*c*) We have $$v_B = (v_B)_0 + a_B t$$

At $t = t_{AB}$: $$v_B = 58.667 \text{ ft/s} + (0.83447 \text{ ft/s}^2)(20.685 \text{ s})$$

$$= 75.927 \text{ ft/s} \qquad v_B = 51.8 \text{ mi/h} \blacktriangleleft$$

PROBLEM 11.44

An elevator is moving upward at a constant speed of 4 m/s. A man standing 10 m above the top of the elevator throws a ball upward with a speed of 3 m/s. Determine (*a*) when the ball will hit the elevator, (*b*) where the ball will hit the elevator with respect to the location of the man.

SOLUTION

Place the origin of the position coordinate at the level of the standing man, the positive direction being up. The ball undergoes uniformly accelerated motion.

$$y_B = (y_B)_0 + (v_B)_0 t - \frac{1}{2} g t^2$$

with $(y_B)_0 = 0$, $(v_B)_0 = 3$ m/s, and $g = 9.81$ m/s^2.

$$y_B = 3t - 4.905t^2$$

The elevator undergoes uniform motion.

$$y_E = (y_E)_0 + v_E t$$

with $(y_E)_0 = -10$ m and $v_E = 4$ m/s.

(*a*) Time of impact. Set $y_B = y_E$

$$3t - 4.905t^2 = -10 + 4t$$

$$4.905t^2 + t - 10 = 0$$

$t = 1.3295$ and -1.5334 $\qquad t = 1.330$ s ◀

(*b*) Location of impact.

$$y_B = (3)(1.3295) - (4.905)(1.3295)^2 = -4.68 \text{ m}$$

$$y_E = -10 + (4)(1.3295) = -4.68 \text{ m} \qquad \text{(checks)}$$

4.68 m below the man ◀

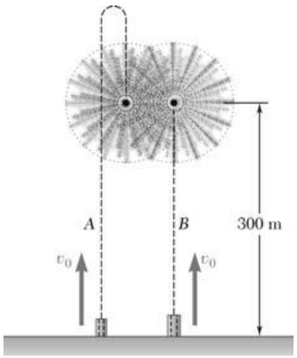
PROBLEM 11.45



Two rockets are launched at a fireworks display. Rocket A is launched with an initial velocity $v_0 = 100$ m/s and rocket B is launched t_1 seconds later with the same initial velocity. The two rockets are timed to explode simultaneously at a height of 300 m as A is falling and B is rising. Assuming a constant acceleration $g = 9.81\ \text{m/s}^2$, determine (*a*) the time t_1, (*b*) the velocity of B relative to A at the time of the explosion.

SOLUTION

Place origin at ground level. The motion of rockets A and B is

Rocket A: $$v_A = (v_A)_0 - gt = 100 - 9.81t \quad (1)$$

$$y_A = (y_A)_0 + (v_A)_0 t - \frac{1}{2}gt^2 = 100t - 4.905t^2 \quad (2)$$

Rocket B: $$v_B = (v_B)_0 - g(t - t_1) = 100 - 9.81(t - t_1) \quad (3)$$

$$y_B = (y_B)_0 + (v_B)_0 (t - t_1) - \frac{1}{2}g(t - t_1)^2$$
$$= 100(t - t_1) - 4.905(t - t_1)^2 \quad (4)$$

Time of explosion of rockets A and B. $y_A = y_B = 300$ ft

From (2), $$300 = 100t - 4.905t^2$$

$$4.905t^2 - 100t + 300 = 0$$

$$t = 16.732 \text{ s} \quad \text{and} \quad 3.655 \text{ s}$$

From (4), $$300 = 100(t - t_1) - 4.905(t - t_1^2)$$

$$t - t_1 = 16.732 \text{ s} \quad \text{and} \quad 3.655 \text{ s}$$

Since rocket A is falling, $t = 16.732$ s

Since rocket B is rising, $t - t_1 = 3.655$ s

(*a*) Time t_1: $t_1 = t - (t - t_1)$ $\quad$ $t_1 = 13.08 \text{ s}$ ◀

(*b*) Relative velocity at explosion.

From (1), $v_A = 100 - (9.81)(16.732) = -64.15$ m/s

From (3), $v_B = 100 - (9.81)(16.732 - 13.08) = 64.15$ m/s

Relative velocity: $v_{B/A} = v_B - v_A$ $\quad$ $v_{B/A} = 128.3 \text{ m/s}\uparrow$ ◀

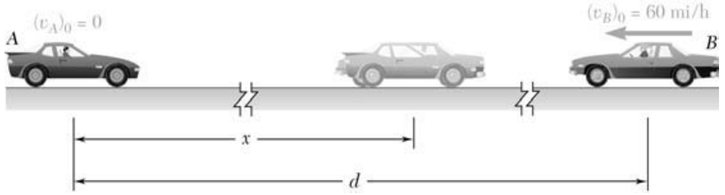
PROBLEM 11.46

Car A is parked along the northbound lane of a highway, and car B is traveling in the southbound lane at a constant speed of 60 mi/h. At $t = 0$, A starts and accelerates at a constant rate a_A, while at $t = 5$ s, B begins to slow down with a constant deceleration of magnitude $a_A/6$. Knowing that when the cars pass each other $x = 294$ ft and $v_A = v_B$, determine (*a*) the acceleration a_A, (*b*) when the vehicles pass each other, (*c*) the distance d between the vehicles at $t = 0$.



SOLUTION

For $t \geq 0$: $\quad v_A = 0 + a_A t$

$$x_A = 0 + 0 + \frac{1}{2}a_A t^2$$

$0 \leq t < 5$ s: $\quad x_B = 0 + (v_B)_0 t \quad (v_B)_0 = 60 \text{ mi/h} = 88 \text{ ft/s}$

At $t = 5$ s: $\quad x_B = (88 \text{ ft/s})(5 \text{ s}) = 440 \text{ ft}$

For $t \geq 5$ s: $\quad v_B = (v_B)_0 + a_B(t-5) \qquad a_B = -\frac{1}{6}a_A$

$$x_B = (x_B)_S + (v_B)_0(t-5) + \frac{1}{2}a_B(t-5)^2$$

Assume $t > 5$ s when the cars pass each other.

At that time (t_{AB}),

$v_A = v_B$: $\quad a_A t_{AB} = (88 \text{ ft/s}) - \frac{a_A}{6}(t_{AB} - 5)$

$x_A = 294$ ft: $\quad 294 \text{ ft} = \frac{1}{2}a_A t_{AB}^2$

Then
$$\frac{a_A\left(\frac{7}{6}t_{AB} - \frac{5}{6}\right)}{\frac{1}{2}a_A t_{AB}^2} = \frac{88}{294}$$

or
$$44t_{AB}^2 - 343t_{AB} + 245 = 0$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.46 (Continued)

Solving $t_{AB} = 0.795 \text{ s}$ and $t_{AB} = 7.00 \text{ s}$

(*a*) With $t_{AB} > 5$ s, $$294 \text{ ft} = \frac{1}{2} a_A (7.00 \text{ s})^2$$

or $$a_A = 12.00 \text{ ft/s}^2 \blacktriangleleft$$

(*b*) From above $$t_{AB} = 7.00 \text{ s} \blacktriangleleft$$

Note: An acceptable solution cannot be found if it is assumed that $t_{AB} \le 5$ s.

(*c*) We have
$$d = x + (x_B)_{t_{AB}}$$
$$= 294 \text{ ft} + 440 \text{ ft} + (88 \text{ ft/s})(2.00 \text{ s})$$
$$+ \frac{1}{2}\left(-\frac{1}{6} \times 12.00 \text{ ft/s}^2\right)(2.00 \text{ s})^2$$

or $$d = 906 \text{ ft} \blacktriangleleft$$

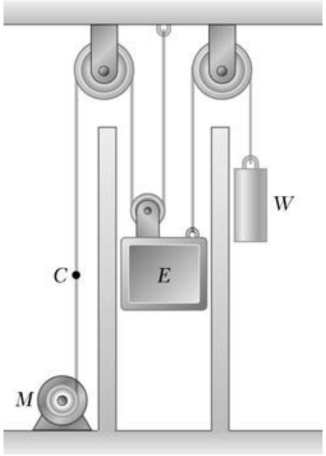
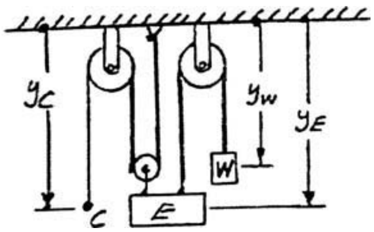
PROBLEM 11.47



The elevator shown in the figure moves downward with a constant velocity of 4 m/s. Determine (*a*) the velocity of the cable *C*, (*b*) the velocity of the counterweight *W*, (*c*) the relative velocity of the cable *C* with respect to the elevator, (*d*) the relative velocity of the counterweight *W* with respect to the elevator.

SOLUTION



Choose the positive direction downward.

(*a*) Velocity of cable *C*.

$$y_C + 2y_E = \text{constant}$$

$$v_C + 2v_E = 0$$

But, $\quad v_E = 4 \text{ m/s}$

or $\quad v_C = -2v_E = -8 \text{ m/s} \qquad \mathbf{v}_C = 8.00 \text{ m/s} \uparrow \blacktriangleleft$

(*b*) Velocity of counterweight *W*.

$$y_W + y_E = \text{constant}$$

$$v_W + v_E = 0 \quad v_W = -v_E = -4 \text{ m/s} \qquad \mathbf{v}_W = 4.00 \text{ m/s} \uparrow \blacktriangleleft$$

(*c*) Relative velocity of *C* with respect to *E*.

$$v_{C/E} = v_C - v_E = (-8 \text{ m/s}) - (+4 \text{ m/s}) = -12 \text{ m/s}$$

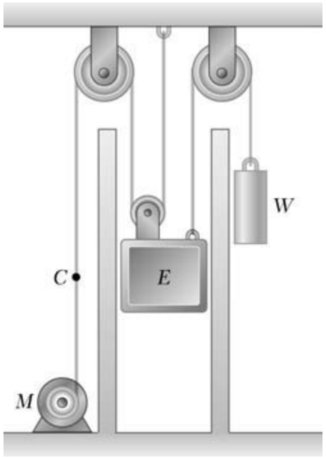
$$\mathbf{v}_{C/E} = 12.00 \text{ m/s} \uparrow \blacktriangleleft$$

(*d*) Relative velocity of *W* with respect to *E*.

$$v_{W/E} = v_W - v_E = (-4 \text{ m/s}) - (4 \text{ m/s}) = -8 \text{ m/s}$$

$$\mathbf{v}_{W/E} = 8.00 \text{ m/s} \uparrow \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

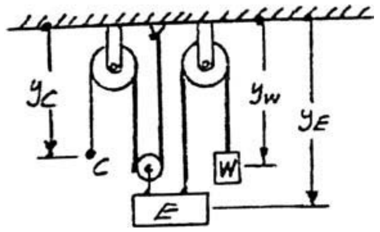


PROBLEM 11.48

The elevator shown starts from rest and moves upward with a constant acceleration. If the counterweight W moves through 30 ft in 5 s, determine (*a*) the acceleration of the elevator and the cable C, (*b*) the velocity of the elevator after 5 s.

SOLUTION

We choose positive direction downward for motion of counterweight.



$$y_W = \frac{1}{2} a_W t^2$$

At $t = 5$ s, $\quad y_W = 30$ ft

$$30 \text{ ft} = \frac{1}{2} a_W (5 \text{ s})^2$$

$$a_W = 2.4 \text{ ft/s}^2 \qquad \mathbf{a}_W = 2.4 \text{ ft/s}^2 \downarrow$$

(*a*) Accelerations of E and C.

Since $\quad y_W + y_E = \text{constant} \quad v_W + v_E = 0, \quad \text{and} \quad a_W + a_E = 0$

Thus: $\quad a_E = -a_W = -(2.4 \text{ ft/s}^2), \qquad \mathbf{a}_E = 2.40 \text{ ft/s}^2 \uparrow$ ◀

Also, $\quad y_C + 2y_E = \text{ constant}, \quad v_C + 2v_E = 0, \quad \text{and} \quad a_C + 2a_E = 0$

Thus: $\quad a_C = -2a_E = -2(-2.4 \text{ ft/s}^2) = +4.8 \text{ ft/s}^2, \qquad \mathbf{a}_C = 4.80 \text{ ft/s}^2 \downarrow$ ◀

(*b*) Velocity of elevator after 5 s.

$$v_E = (v_E)_0 + a_E t = 0 + (-2.4 \text{ ft/s}^2)(5 \text{ s}) = -12 \text{ ft/s} \qquad (\mathbf{v}_E)_5 = 12.00 \text{ ft/s} \uparrow$$ ◀

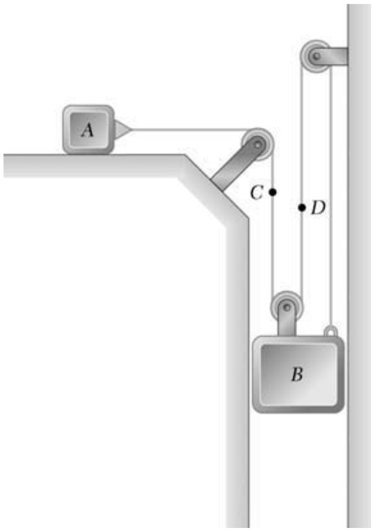
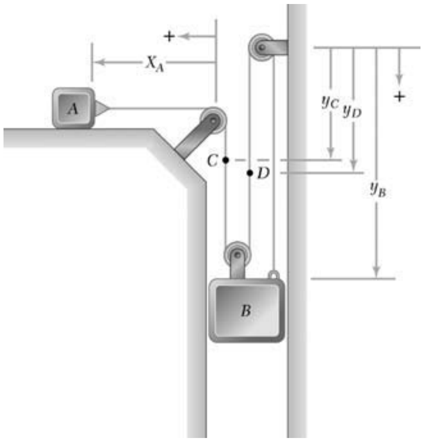
PROBLEM 11.49



Slider block A moves to the left with a constant velocity of 6 m/s. Determine (a) the velocity of block B, (b) the velocity of portion D of the cable, (c) the relative velocity of portion C of the cable with respect to portion D.

SOLUTION



From the diagram, we have

$$x_A + 3y_B = \text{constant}$$

Then $\quad v_A + 3v_B = 0 \quad (1)$

and $\quad a_A + 3a_B = 0 \quad (2)$

(a) Substituting into Eq. (1) $\quad 6\text{ m/s} + 3v_B = 0$

or $\quad \mathbf{v}_B = 2.00\text{ m/s}\uparrow$ ◀

(b) From the diagram $\quad y_B + y_D = \text{constant}$

Then $\quad v_B + v_D = 0$

$\mathbf{v}_D = 2.00\text{ m/s}\downarrow$ ◀

(c) From the diagram $\quad x_A + y_C = \text{constant}$

Then $\quad v_A + v_C = 0 \qquad v_C = -6\text{ m/s}$

Now $\quad v_{C/D} = v_C - v_D = (-6\text{ m/s}) - (2\text{ m/s}) = -8\text{ m/s}$

$\mathbf{v}_{C/D} = 8.00\text{ m/s}\uparrow$ ◀

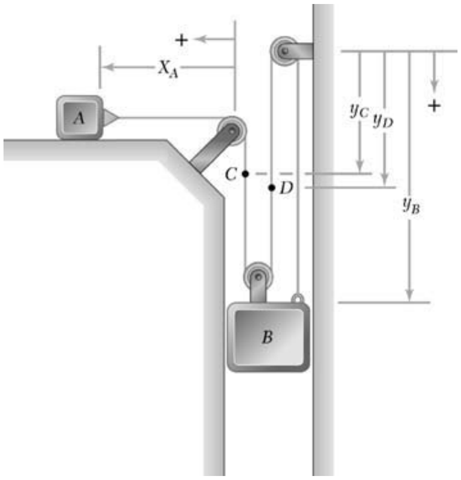
PROBLEM 11.50

Block B starts from rest and moves downward with a constant acceleration. Knowing that after slider block A has moved 9 in. its velocity is 6 ft/s, determine (a) the accelerations of A and B, (b) the velocity and the change in position of B after 2 s.

SOLUTION



From the diagram, we have

$$x_A + 3y_B = \text{constant}$$

Then $$v_A + 3v_B = 0 \qquad (1)$$

and $$a_A + 3a_B = 0 \qquad (2)$$

(a) Eq. (2): $a_A + 3a_B = 0$ and $\mathbf{a}_B$ is constant and positive $\Rightarrow \mathbf{a}_A$ is constant and negative

Also, Eq. (1) and $(v_B)_0 = 0 \Rightarrow (v_A)_0 = 0$

Then $$v_A^2 = 0 + 2a_A[x_A - (x_A)_0]$$

When $|\Delta x_A| = 0.4$ m: $(6 \text{ ft/s})^2 = 2a_A(9/12 \text{ ft})$

or $$\mathbf{a}_A = 24.0 \text{ ft/s}^2 \longrightarrow \blacktriangleleft$$

Then, substituting into Eq. (2):

$$-24 \text{ ft/s}^2 + 3a_B = 0$$

or $$a_B = \frac{24}{3} \text{ ft/s}^2 \qquad \mathbf{a}_B = 8.00 \text{ ft/s}^2 \downarrow \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

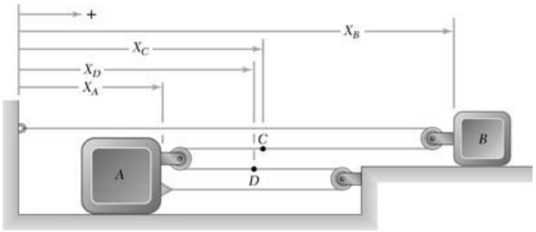
PROBLEM 11.52

At the instant shown, slider block B is moving with a constant acceleration, and its speed is 150 mm/s. Knowing that after slider block A has moved 240 mm to the right its velocity is 60 mm/s, determine (a) the accelerations of A and B, (b) the acceleration of portion D of the cable, (c) the velocity and change in position of slider block B after 4 s.

SOLUTION



From the diagram $$x_B + (x_B - x_A) - 2x_A = \text{constant}$$

Then $$2v_B - 3v_A = 0 \quad (1)$$

and $$2a_B - 3a_A = 0 \quad (2)$$

(a) First observe that if block A moves to the right, $\mathbf{v}_A \rightarrow$ and Eq. (1) $\Rightarrow \mathbf{v}_B \rightarrow$. Then, using Eq. (1) at $t = 0$

$$2(150 \text{ mm/s}) - 3(v_A)_0 = 0$$

or $$(v_A)_0 = 100 \text{ mm/s}$$

Also, Eq. (2) and $a_B =$ constant $\Rightarrow a_A =$ constant

Then $$v_A^2 = (v_A)_0^2 + 2a_A[x_A - (x_A)_0]$$

When $x_A - (x_A)_0 = 240$ mm:

$$(60 \text{ mm/s})^2 = (100 \text{ mm/s})^2 + 2a_A(240 \text{ mm})$$

or $$a_A = -\frac{40}{3} \text{ mm/s}^2$$

or $$\mathbf{a}_A = 13.33 \text{ mm/s}^2 \leftarrow \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.55

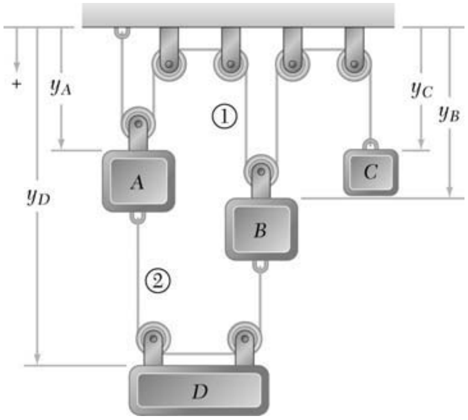
Block C starts from rest at $t = 0$ and moves downward with a constant acceleration of 4 in./s^2. Knowing that block B has a constant velocity of 3 in./s upward, determine (a) the time when the velocity of block A is zero, (b) the time when the velocity of block A is equal to the velocity of block D, (c) the change in position of block A after 5 s.

SOLUTION



From the diagram:

Cord 1: $$2y_A + 2y_B + y_C = \text{constant}$$

Then $$2v_A + 2v_B + v_C = 0$$

and $$2a_A + 2a_B + a_C = 0 \qquad (1)$$

Cord 2: $$(y_D - y_A) + (y_D - y_B) = \text{constant}$$

Then $$2v_D - v_A - v_B = 0$$

and $$2a_D - a_A - a_B = 0 \qquad (2)$$

Use units of inches and seconds.

Motion of block C: $$v_C = v_{C0} + a_C t$$
$$= 0 + 4t \quad \text{where} \quad a_C = -4 \text{ in./s}^2$$

Motion of block B: $$v_B = -3 \text{ in./s}; \qquad a_B = 0$$

Motion of block A: From (1) and (2),

$$v_A = -v_B - \frac{1}{2}v_C = 3 - \frac{1}{2}(4t) = 3 - 2t \text{ in./s}$$

$$a_A = -a_B - \frac{1}{2}a_C = 0 - \frac{1}{2}(4) = -2 \text{ in./s}^2$$

PROBLEM 11.55 (Continued)

(*a*) Time when v_B is zero.

$$3 - 2t = 0 \qquad t = 1.500 \text{ s} \blacktriangleleft$$

Motion of block D: From (3),

$$v_D = \frac{1}{2}v_A + \frac{1}{2}v_B = \frac{1}{2}(3 - 2t) - \frac{1}{2}(3) = -1t$$

(*b*) Time when v_A is equal to v_0.

$$3 - 2t = -t \qquad t = 3.00 \text{ s} \blacktriangleleft$$

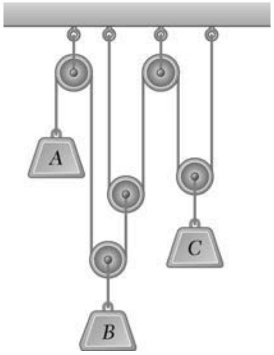
(*c*) Change in position of block A ($t = 5$ s).

$$\Delta y_A = (v_A)_0 t + \frac{1}{2}a_A t^2$$

$$= (3)(5) + \frac{1}{2}(-2)(5)^2 = -10 \text{ in.}$$

Change in position $= 10.00$ in. $\uparrow$ ◀

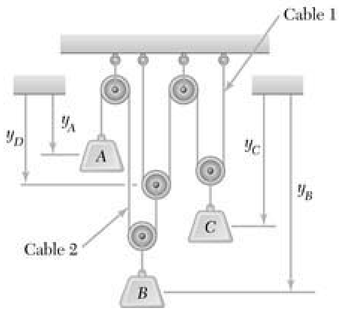
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.56

Block A starts from rest at t = 0 and moves downward with a constant acceleration of 6 in./s^2. Knowing that block B moves up with a constant velocity of 3 in./s, determine (a) the time when the velocity of block C is zero, (b) the corresponding position of block C.

SOLUTION



The cable lengths are constant.

$$L_1 = 2y_C + 2y_D + \text{constant}$$
$$L_2 = y_A + y_B + (y_B - y_D) + \text{constant}$$

Eliminate y_D.

$$L_1 + 2L_2 = 2y_C + 2y_D + 2y_A + 2y_B + 2(y_B - y_D) + \text{constant}$$
$$2(y_C + y_A + 2y_B) = \text{constant}$$

Differentiate to obtain relationships for velocities and accelerations, positive downward.

$$v_C + v_A + 2v_B = 0 \tag{1}$$
$$a_C + a_A + 2a_B = 0 \tag{2}$$

Use units of inches and seconds.

Motion of block A: $v_A = a_A t + 6t$

$$\Delta y_A = \frac{1}{2}a_A t^2 = \frac{1}{2}(6)t^2 = 3t^2$$

Motion of block B: $\mathbf{v}_B = 3\text{ in./s}\uparrow \quad v_B = -3\text{ in./s}$

$$\Delta y_B = v_B t = -3t$$

Motion of block C: From (1),

$$v_C = -v_A - 2v_B = -6t - 2(-3) = 6 - 6t$$
$$\Delta y_C = \int_0^t v_C\,dt = 6t - 3t^2$$

(a) Time when v_C is zero. $6 - 6t = 0$ $\qquad t = 1.000\text{ s}$ ◀

(b) Corresponding position.

$$\Delta y_C = (6)(1) - (3)(1)^2 = 3\text{ in.} \qquad \Delta y_C = 3.00\text{ in.}\downarrow$$ ◀

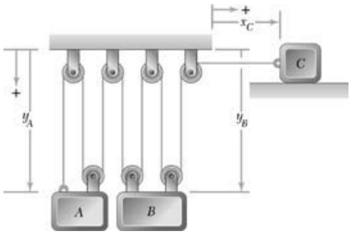
PROBLEM 11.57

Block B starts from rest, block A moves with a constant acceleration, and slider block C moves to the right with a constant acceleration of $75\ \text{mm/s}^2$. Knowing that at $t = 2$ s the velocities of B and C are 480 mm/s downward and 280 mm/s to the right, respectively, determine (a) the accelerations of A and B, (b) the initial velocities of A and C, (c) the change in position of slider block C after 3 s.

SOLUTION



From the diagram

$$3y_A + 4y_B + x_C = \text{constant}$$

Then $\quad 3v_A + 4v_B + v_C = 0 \qquad (1)$

and $\quad 3a_A + 4a_B + a_C = 0 \qquad (2)$

Given: $\quad (v_B) = 0,$

$$a_A = \text{constent}$$

$$(\mathbf{a}_C) = 75\ \text{mm/s}^2 \longrightarrow$$

At $t = 2$ s, $\quad \mathbf{v}_B = 480\ \text{mm/s}\downarrow$

$$\mathbf{v}_C = 280\ \text{mm/s} \longrightarrow$$

(a) Eq. (2) and $a_A = \text{constant}$ and $a_C = \text{constant} \Rightarrow a_B = \text{constant}$

Then $\quad v_B = 0 + a_B t$

At $t = 2$ s: $\quad 480\ \text{mm/s} = a_B(2\ \text{s})$

$$a_B = 240\ \text{mm/s}^2 \qquad \text{or} \qquad \mathbf{a}_B = 240\ \text{mm/s}^2\downarrow \blacktriangleleft$$

Substituting into Eq. (2)

$$3a_A + 4(240\ \text{mm/s}^2) + (75\ \text{mm/s}^2) = 0$$

$$a_A = -345\ \text{mm/s} \qquad \text{or} \qquad \mathbf{a}_A = 345\ \text{mm/s}^2\uparrow \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

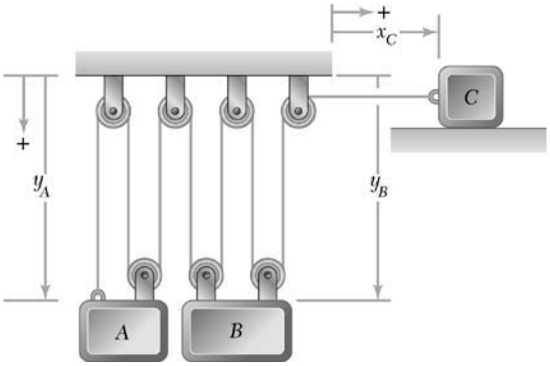
PROBLEM 11.58

Block B moves downward with a constant velocity of 20 mm/s. At $t = 0$, block A is moving upward with a constant acceleration, and its velocity is 30 mm/s. Knowing that at $t = 3$ s slider block C has moved 57 mm to the right, determine (*a*) the velocity of slider block C at $t = 0$, (*b*) the accelerations of A and C, (*c*) the change in position of block A after 5 s.

SOLUTION



From the diagram

$$3y_A + 4y_B + x_C = \text{constant}$$

Then $$3v_A + 4v_B + v_C = 0 \qquad (1)$$

and $$3a_A + 4a_B + a_C = 0 \qquad (2)$$

<u>Given</u>: $\mathbf{v}_B = 20 \text{ mm/s}\downarrow;$

$$(\mathbf{v}_A)_0 = 30 \text{ mm/s}\uparrow$$

(*a*) Substituting into Eq. (1) at $t = 0$

$$3(-30 \text{ mm/s}) + 4(20 \text{ mm/s}) + (v_C)_0 = 0$$

$$(v_C)_0 = 10 \text{ mm/s} \qquad \text{or} \qquad (\mathbf{v}_C)_0 = 10.00 \text{ mm/s} \longrightarrow \blacktriangleleft$$

(*b*) We have $$x_C = (x_C)_0 + (v_C)_0 t + \frac{1}{2} a_C t^2$$

At $t = 3$ s: $$57 \text{ mm} = (10 \text{ mm/s})(3 \text{ s}) + \frac{1}{2} a_C (3 \text{ s})^2$$

$$a_C = 6 \text{ mm/s}^2 \qquad \text{or} \qquad \mathbf{a}_C = 6.00 \text{ mm/s}^2 \longrightarrow \blacktriangleleft$$

Now $$\mathbf{v}_B = \text{constant} \rightarrow a_B = 0$$

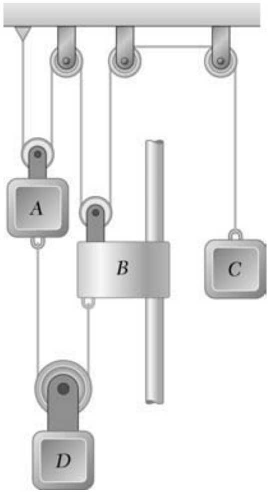
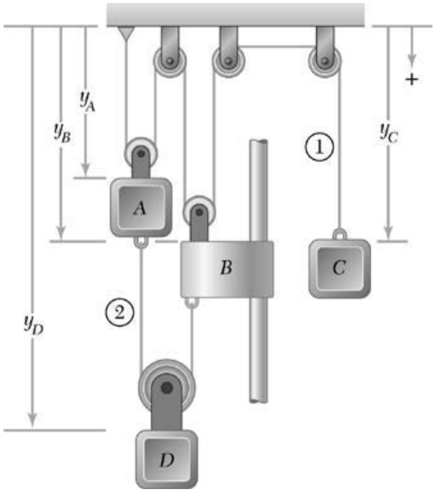
PROBLEM 11.59



The system shown starts from rest, and each component moves with a constant acceleration. If the relative acceleration of block C with respect to collar B is $60\ \text{mm/s}^2$ upward and the relative acceleration of block D with respect to block A is $110\ \text{mm/s}^2$ downward, determine (a) the velocity of block C after 3 s, (b) the change in position of block D after 5 s.

SOLUTION



From the diagram

Cable 1: $\quad 2y_A + 2y_B + y_C = \text{constant}$

Then $\quad 2v_A + 2v_B + v_C = 0 \quad (1)$

and $\quad 2a_A + 2a_B + a_C = 0 \quad (2)$

Cable 2: $\quad (y_D - y_A) + (y_D - y_B) = \text{constant}$

Then $\quad -v_A - v_B + 2v_D = 0 \quad (3)$

and $\quad -a_A - a_B + 2a_D = 0 \quad (4)$

Given: At $t = 0,\ v = 0;$ all accelerations constant;
$a_{C/B} = 60\ \text{mm/s}^2 \uparrow,\ a_{D/A} = 110\ \text{mm/s}^2 \downarrow$

(a) We have $\quad a_{C/B} = a_C - a_B = -60 \quad$ or $\quad a_B = a_C + 60$

and $\quad a_{D/A} = a_D - a_A = 110 \quad$ or $\quad a_A = a_D - 110$

Substituting into Eqs. (2) and (4)

Eq. (2): $\quad 2(a_D - 110) + 2(a_C + 60) + a_C = 0$

or $\quad 3a_C + 2a_D = 100 \quad (5)$

Eq. (4): $\quad -(a_D - 110) - (a_C + 60) + 2a_D = 0$

or $\quad -a_C + a_D = -50 \quad (6)$

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

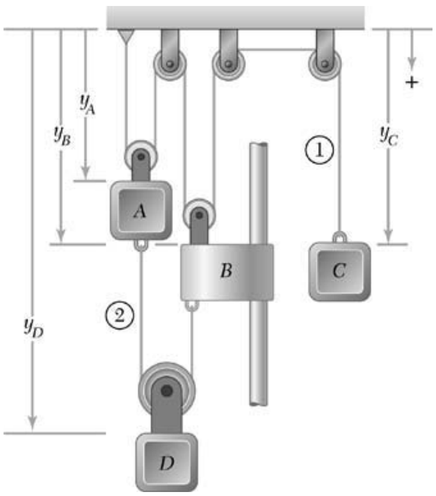
PROBLEM 11.60*

The system shown starts from rest, and the length of the upper cord is adjusted so that A, B, and C are initially at the same level. Each component moves with a constant acceleration, and after 2 s the relative change in position of block C with respect to block A is 280 mm upward. Knowing that when the relative velocity of collar B with respect to block A is 80 mm/s downward, the displacements of A and B are 160 mm downward and 320 mm downward, respectively, determine (*a*) the accelerations of A and B if $a_B > 10\text{ mm/s}^2$, (*b*) the change in position of block D when the velocity of block C is 600 mm/s upward.

SOLUTION



From the diagram

Cable 1: $2y_A + 2y_B + y_C = \text{constant}$

Then $2v_A + 2v_B + v_C = 0$ (1)

and $2a_A + 2a_B + a_C = 0$ (2)

Cable 2: $(y_D - y_A) + (y_D - y_B) = \text{constant}$

Then $-v_A - v_B - 2v_D = 0$ (3)

and $-a_A - a_B + 2a_D = 0$ (4)

Given: At

$$t = 0$$
$$v = 0$$
$$(y_A)_0 = (y_B)_0 = (y_C)_0$$

All accelerations constant.

At $t = 2$ s

$$y_{C/A} = 280\text{ mm}\uparrow$$

When

$$v_{B/A} = 80\text{ mm/s}\downarrow$$
$$y_A - (y_A)_0 = 160\text{ mm}\uparrow$$
$$y_B - (y_B)_0 = 320\text{ mm}\downarrow$$
$$a_B > 10\text{ mm/s}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.60* (Continued)

(*a*) We have $y_A = (y_A)_0 + (0)t + \frac{1}{2}a_A t^2$

and $y_C = (y_C)_0 + (0)t + \frac{1}{2}a_C t^2$

Then $y_{C/A} = y_C - y_A = \frac{1}{2}(a_C - a_A)t^2$

At $t = 2$ s, $y_{C/A} = -280$ mm:

$$-280 \text{ mm} = \frac{1}{2}(a_C - a_A)(2 \text{ s})^2$$

or $a_C = a_A - 140$ (5)

Substituting into Eq. (2)

$$2a_A + 2a_B + (a_A - 140) = 0$$

or $a_A = \frac{1}{3}(140 - 2a_B)$ (6)

Now $v_B = 0 + a_B t$

$v_A = 0 + a_A t$

$v_{B/A} = v_B - v_A = (a_B - a_A)t$

Also $y_B = (y_B)_0 + (0)t + \frac{1}{2}a_B t^2$

When $\mathbf{v}_{B/A} = 80 \text{ mm/s}\downarrow$: $80 = (a_B - a_A)t$ (7)

$\Delta y_A = 160 \text{ mm}\downarrow$: $160 = \frac{1}{2}a_A t^2$

$\Delta y_B = 320 \text{ mm}\downarrow$: $320 = \frac{1}{2}a_B t^2$

Then $160 = \frac{1}{2}(a_B - a_A)t^2$

Using Eq. (7) $320 = (80)t$ or $t = 4$ s

Then $160 = \frac{1}{2}a_A(4)^2$ or $\mathbf{a}_A = 20.0 \text{ mm/s}^2\downarrow$ ◀

and $320 = \frac{1}{2}a_B(4)^2$ or $\mathbf{a}_B = 40.0 \text{ mm/s}^2\downarrow$ ◀

Note that Eq. (6) is not used; thus, the problem is over-determined.

PROBLEM 11.63

A particle moves in a straight line with the velocity shown in the figure. Knowing that $x = -540$ m at $t = 0$, (*a*) construct the a–t and x–t curves for $0 < t < 50$ s, and determine (*b*) the total distance traveled by the particle when $t = 50$ s, (*c*) the two times at which $x = 0$.

SOLUTION

(*a*) $a_t =$ slope of v–t curve at time t

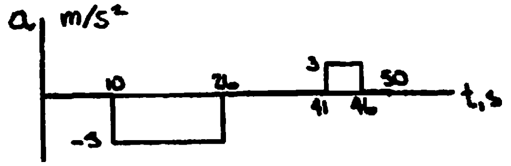
From $t = 0$ to $t = 10$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 10$ s to $t = 26$ s: $a = \dfrac{-20-60}{26-10} = -5 \text{ m/s}^2$

$t = 26$ s to $t = 41$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 41$ s to $t = 46$ s: $a = \dfrac{-5-(-20)}{46-41} = 3 \text{ m/s}^2$

$t = 46$ s: $v = \text{constant} \Rightarrow a = 0$



$x_2 = x_1 +$ (area under v–t curve from t_1 to t_2)

At $t = 10$ s: $x_{10} = -540 + 10(60) + 60$ m

Next, find time at which $v = 0$. Using similar triangles

$$\frac{t_{v=0} - 10}{60} = \frac{26-10}{80} \quad \text{or} \quad t_{v=0} = 22 \text{ s}$$

At $t = 22$ s: $x_{22} = 60 + \frac{1}{2}(12)(60) = 420$ m

$t = 26$ s: $x_{26} = 420 - \frac{1}{2}(4)(20) = 380$ m

$t = 41$ s: $x_{41} = 380 - 15(20) = 80$ m

$t = 46$ s: $x_{46} = 80 - 5\left(\dfrac{20+5}{2}\right) = 17.5$ m

$t = 50$ s: $x_{50} = 17.5 - 4(5) = -2.5$ m

PROBLEM 11.64

A particle moves in a straight line with the velocity shown in the figure. Knowing that $x = -540$ m at $t = 0$, (*a*) construct the a–t and x–t curves for $0 < t < 50$ s, and determine (*b*) the maximum value of the position coordinate of the particle, (*c*) the values of t for which the particle is at $x = 100$ m.

SOLUTION

(*a*) $a_t =$ slope of v–t curve at time t

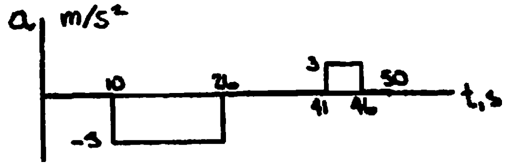
From $t = 0$ to $t = 10$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 10$ s to $t = 26$ s: $a = \dfrac{-20 - 60}{26 - 10} = -5 \text{ m/s}^2$

$t = 26$ s to $t = 41$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 41$ s to $t = 46$ s: $a = \dfrac{-5 - (-20)}{46 - 41} = 3 \text{ m/s}^2$

$t = 46$ s: $v = \text{constant} \Rightarrow a = 0$



$x_2 = x_1 +$ (area under v–t curve from t_1 to t_2)

At $t = 10$ s: $x_{10} = -540 + 10(60) = 60$ m

Next, find time at which $v = 0$. Using similar triangles

$$\frac{t_{v=0} - 10}{60} = \frac{26 - 10}{80} \qquad \text{or} \qquad t_{v=0} = 22 \text{ s}$$

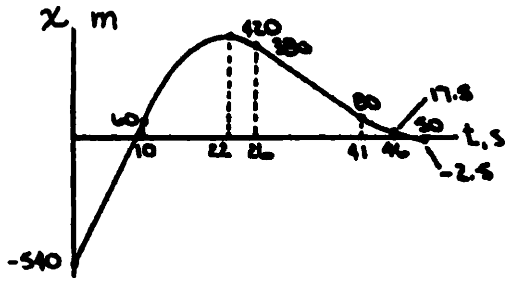
At $t = 22$ s: $x_{22} = 60 + \frac{1}{2}(12)(60) = 420$ m

$t = 26$ s: $x_{26} = 420 - \frac{1}{2}(4)(20) = 380$ m

$t = 41$ s: $x_{41} = 380 - 15(20) = 80$ m

$t = 46$ s: $x_{46} = 80 - 5\left(\dfrac{20 + 5}{2}\right) = 17.5$ m

$t = 50$ s: $x_{50} = 17.5 - 4(5) = -2.5$ m



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.65

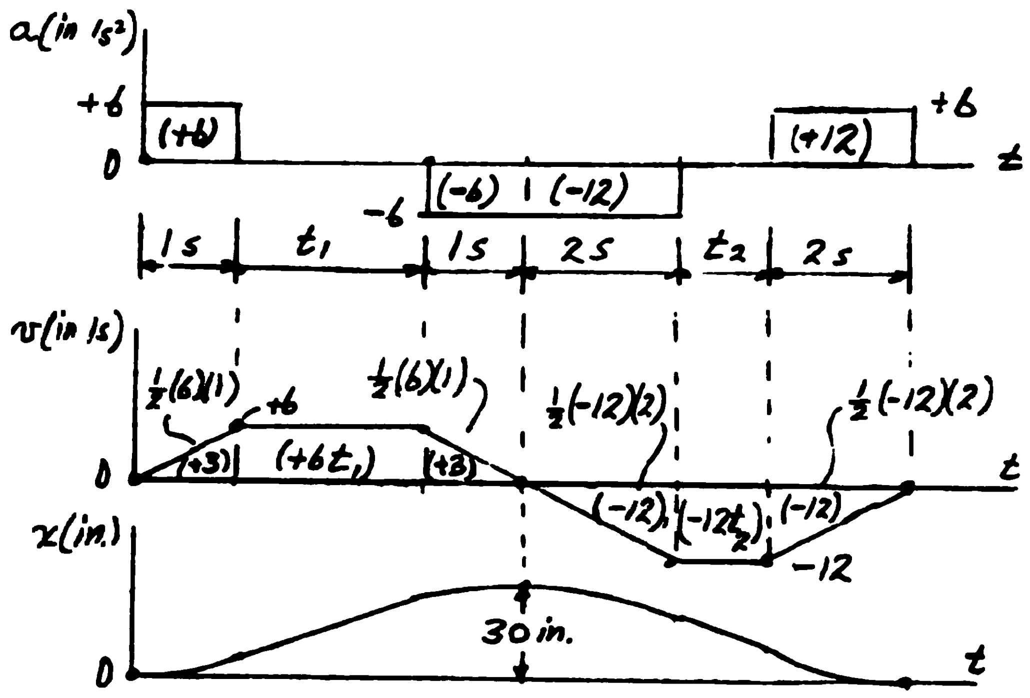
During a finishing operation the bed of an industrial planer moves alternately 30 in. to the right and 30 in. to the left. The velocity of the bed is limited to a maximum value of 6 in./s to the right and 12 in./s to the left; the acceleration is successively equal to 6 in./s^2 to the right, zero 6 in./s^2 to the left, zero, etc. Determine the time required for the bed to complete a full cycle, and draw the *v–t* and *x–t* curves.

SOLUTION

We choose positive to the right, thus the range of permissible velocities is $-12\text{ in./s} < v < 6\text{ in./s}$ since acceleration is $-6\text{ in./s}^2, 0$, or $+6\text{ in./s}^2$. The slope the *v–t* curve must also be –6 in./s^2, 0, or +6 in./s^2.



Planer moves = 30 in. to right: $+30\text{ in.} = 3 + 6t_1 + 3$ $\qquad t_1 = 4.00\text{ s}$

Planer moves = 30 in. to left: $-30\text{ in.} = -12 - 12t_2 + 12$ $\qquad t_2 = 0.50\text{ s}$

Total time $= 1\text{ s} + 4\text{ s} + 1\text{ s} + 2\text{ s} + 0.5\text{ s} + 2\text{ s} = 10.5\text{ s}$ $\qquad t_{\text{total}} = 10.50\text{ s}$ ◀

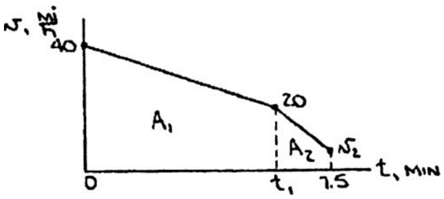
PROBLEM 11.67

A commuter train traveling at 40 mi/h is 3 mi from a station. The train then decelerates so that its speed is 20 mi/h when it is 0.5 mi from the station. Knowing that the train arrives at the station 7.5 min after beginning to decelerate and assuming constant decelerations, determine (*a*) the time required for the train to travel the first 2.5 mi, (*b*) the speed of the train as it arrives at the station, (*c*) the final constant deceleration of the train.

SOLUTION

Given: At $t = 0$, $v = 40$ mi/h, $x = 0$; when $x = 2.5$ mi, $v = 20$ mi/h;
at $t = 7.5$ min, $x = 3$ mi; constant decelerations.

The $v-t$ curve is first drawn as shown.



(*a*) We have $A_1 = 2.5$ mi

$$(t_1 \text{ min})\left(\frac{40+20}{2}\right)\text{ mi/h} \times \frac{1\text{ h}}{60\text{ min}} = 2.5\text{ mi}$$

$t_1 = 5.00$ min ◀

(*b*) We have $A_2 = 0.5$ mi

$$(7.5-5)\text{ min} \times \left(\frac{20+v_2}{2}\right)\text{mi/h} \times \frac{1\text{ h}}{60\text{ min}} = 0.5\text{ mi}$$

$v_2 = 4.00$ mi/h ◀

(*c*) We have

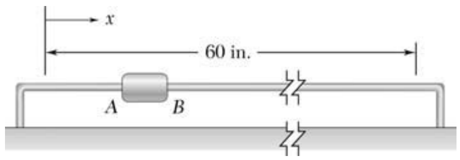
$$a_{\text{final}} = a_{12}$$

$$= \frac{(4-20)\text{ mi/h}}{(7.5-5)\text{ min}} \times \frac{5280\text{ ft}}{\text{mi}} \times \frac{1\text{ min}}{60\text{ s}} \times \frac{1\text{ h}}{3600\text{ s}}$$

$a_{\text{final}} = -0.1564$ ft/s^2 ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.68



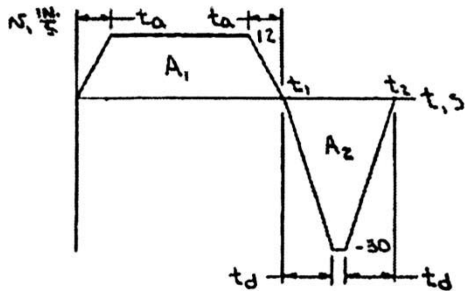
A temperature sensor is attached to slider AB which moves back and forth through 60 in. The maximum velocities of the slider are 12 in./s to the right and 30 in./s to the left. When the slider is moving to the right, it accelerates and decelerates at a constant rate of 6 in./s^2; when moving to the left, the slider accelerates and decelerates at a constant rate of 20 in./s^2. Determine the time required for the slider to complete a full cycle, and construct the $v-t$ and $x-t$ curves of its motion.

SOLUTION

The $v-t$ curve is first drawn as shown. Then

$$t_a = \frac{v_{\text{right}}}{a_{\text{right}}} = \frac{12 \text{ in./s}}{6 \text{ in./s}^2} = 2 \text{ s}$$

$$t_d = \frac{v_{\text{left}}}{a_{\text{left}}} = \frac{30 \text{ in./s}}{20 \text{ in./s}}$$
$$= 1.5 \text{ s}$$



Now $\quad A_1 = 60$ in.

or $\quad [(t_1 - 2) \text{ s}](12 \text{ in./s}) = 60 \text{ in.}$

or $\quad t_1 = 7$ s

and $\quad A_2 = 60$ in.

or $\quad \{[(t_2 - 7) - 1.5] \text{ s}\}(30 \text{ in./s}) = 60 \text{ in.}$

or $\quad t_2 = 10.5$ s

Now $\quad t_{\text{cycle}} = t_2$ $\qquad t_{\text{cycle}} = 10.5 \text{ s}$ ◀

We have $x_{ii} = x_i + $ (area under v–t curve from t_i to t_{ii})

At $t = 2$ s: $\quad x_2 = \frac{1}{2}(2)(12) = 12$ in.

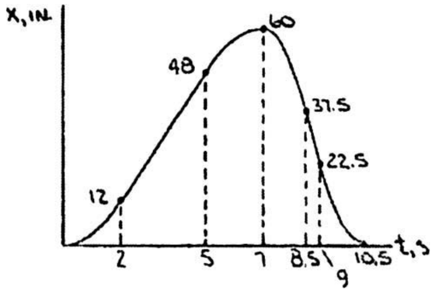
$t = 5$ s: $\quad x_5 = 12 + (5-2)(12)$
$= 48$ in.

$t = 7$ s: $\quad x_7 = 60$ in.

$t = 8.5$ s: $\quad x_{8.5} = 60 - \frac{1}{2}(1.5)(30)$
$= 37.5$ in.

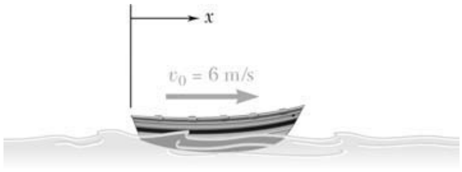
$t = 9$ s: $\quad x_9 = 37.5 - (0.5)(30)$
$= 22.5$ in.

$t = 10.5$ s: $\quad x_{10.5} = 0$



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.69



In a water-tank test involving the launching of a small model boat, the model's initial horizontal velocity is 6 m/s, and its horizontal acceleration varies linearly from -12 m/s^2 at $t = 0$ to -2 m/s^2 at $t = t_1$ and then remains equal to -2 m/s^2 until $t = 1.4$ s. Knowing that $v = 1.8$ m/s when $t = t_1$, determine (*a*) the value of t_1, (*b*) the velocity and the position of the model at $t = 1.4$ s.

SOLUTION

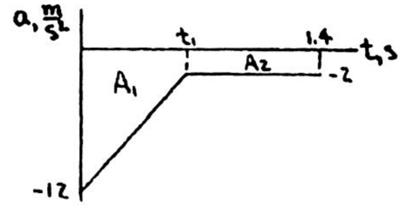
Given: $v_0 = 6\text{ m/s; for } 0 < t < t_1,$

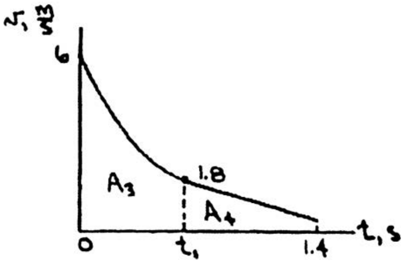
for $t_1 < t < 1.4\text{ s} \quad a = -2\text{ m/s}^2;$

at $t = 0 \quad a = -12\text{ m/s}^2;$

at $t = t_1$ $\quad a = -2\text{ m/s}^2,\ v = 1.8\text{ m/s}^2$

The a–t and v–t curves are first drawn as shown. The time axis is not drawn to scale.





(*a*) We have $v_{t_1} = v_0 + A_1$

$$1.8\text{ m/s} = 6\text{ m/s} - (t_1\text{ s})\left(\frac{12+2}{2}\right)\text{m/s}^2$$

$$t_1 = 0.6\text{ s} \blacktriangleleft$$

(*b*) We have $v_{1.4} = v_{t_1} + A_2$

$$v_{1.4} = 1.8\text{ m/s} - (1.4 - 0.6)\text{ s} \times 2\text{ m/s}^2$$

$$v_{1.4} = 0.20\text{ m/s} \blacktriangleleft$$

Now $x_{1.4} = A_3 + A_4$, where A_3 is most easily determined using integration. Thus,

for $0 < t < t_1$: $\quad a = \dfrac{-2-(-12)}{0.6}t - 12 = \dfrac{50}{3}t - 12$

Now $\quad \dfrac{dv}{dt} = a = \dfrac{50}{3}t - 12$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.71

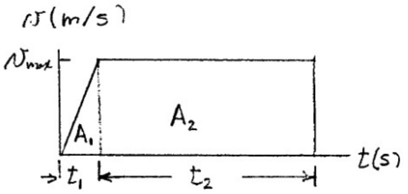
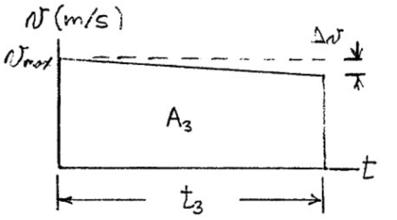
In a 400-m race, runner A reaches her maximum velocity v_A in 4 s with constant acceleration and maintains that velocity until she reaches the half-way point with a split time of 25 s. Runner B reaches her maximum velocity v_B in 5 s with constant acceleration and maintains that velocity until she reaches the half-way point with a split time of 25.2 s. Both runners then run the second half of the race with the same constant deceleration of 0.1 m/s^2. Determine (*a*) the race times for both runners, (*b*) the position of the winner relative to the loser when the winner reaches the finish line.

SOLUTION





Sketch v–t curves for first 200 m.

Runner A: $t_1 = 4$ s, $t_2 = 25 - 4 = 21$ s

$$A_1 = \frac{1}{2}(4)(v_A)_{max} = 2(v_A)_{max}$$

$$A_2 = 21(v_A)_{max}$$

$$A_1 + A_2 = \Delta x = 200 \text{ m}$$

$$23(v_A)_{max} = 200 \qquad \text{or} \qquad (v_A)_{max} = 8.6957 \text{ m/s}$$

Runner B: $t_1 = 5$ s, $t_2 = 25.2 - 5 = 20.2$ s

$$A_1 = \frac{1}{2}(5)(v_B)_{max} = 2.5(v_B)_{max}$$

$$A_2 = 20.2(v_B)_{max}$$

$$A_1 + A_2 = \Delta x = 200 \text{ m}$$

$$22.7(v_B)_{max} = 200 \qquad \text{or} \qquad (v_B)_{max} = 8.8106 \text{ m/s}$$

Sketch v–t curve for second 200 m. $\Delta v = |a|t_3 = 0.1t_3$

$$A_3 = v_{max}t_3 - \frac{1}{2}\Delta v t_3 = 200 \qquad \text{or} \qquad 0.05t_3^2 - v_{max}t_3 + 200 = 0$$

$$t_3 = \frac{v_{max} \pm \sqrt{(v_{max})^2 - (4)(0.05)(200)}}{(2)(0.05)} = 10\left(v_{max} \pm \sqrt{(v_{max})^2 - 40}\right)$$

Runner A: $(v_{max})_A = 8.6957$, $(t_3)_A = 146.64$ s and 27.279 s

Reject the larger root. Then total time $t_A = 25 + 27.279 = 52.279$ s $\qquad t_A = 52.2 \text{ s}$ ◀

PROBLEM 11.71 (Continued)

Runner B: $(v_{max})_B = 8.8106$, $(t_3)_B = 149.45$ s and 26.765 s

Reject the larger root. Then total time $t_B = 25.2 + 26.765 = 51.965$ s

$$t_B = 52.0 \text{ s} ◀$$

Velocity of A at $t = 51.965$ s:

$$v_1 = 8.6957 - (0.1)(51.965 - 25) = 5.999 \text{ m/s}$$

Velocity of A at $t = 51.279$ s:

$$v_2 = 8.6957 - (0.1)(52.279 - 25) = 5.968 \text{ m/s}$$

Over $51.965 \text{ s} \le t \le 52.965$ s, runner A covers a distance Δx

$$\Delta x = v_{ave}(\Delta t) = \frac{1}{2}(5.999 + 5.968)(52.279 - 51.965) \qquad \Delta x = 1.879 \text{ m} ◀$$

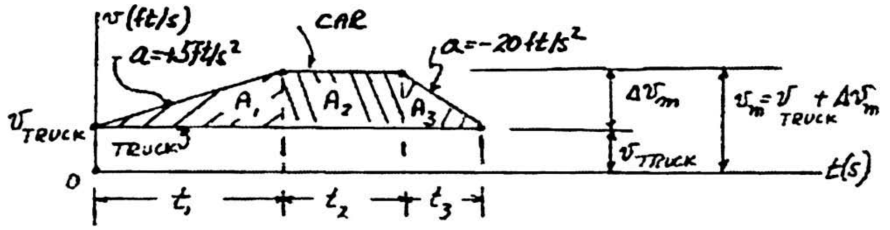
PROBLEM 11.72

A car and a truck are both traveling at the constant speed of 35 mi/h; the car is 40 ft behind the truck. The driver of the car wants to pass the truck, i.e., he wishes to place his car at *B*, 40 ft in front of the truck, and then resume the speed of 35 mi/h. The maximum acceleration of the car is 5 ft/s^2 and the maximum deceleration obtained by applying the brakes is 20 ft/s^2. What is the shortest time in which the driver of the car can complete the passing operation if he does not at any time exceed a speed of 50 mi/h? Draw the $v{-}t$ curve.

SOLUTION

Relative to truck, car must move a distance: $\Delta x = 16 + 40 + 50 + 40 = 146\text{ ft}$

Allowable increase in speed: $\Delta v_m = 50 - 35 = 15\text{ mi/h} = 22\text{ ft/s}$



Acceleration Phase: $t_1 = 22/5 = 4.4\text{ s}$ $\qquad A_1 = \frac{1}{2}(22)(4.4) = 48.4\text{ ft}$

Deceleration Phase: $t_3 = 22/20 = 1.1\text{ s}$ $\qquad A_3 = \frac{1}{2}(22)(1.1) = 12.1\text{ ft}$

But: $\Delta x = A_1 + A_2 + A_3$: $\qquad 146\text{ ft} = 48.4 + (22)t_2 + 12.1 \qquad t_2 = 3.89\text{ s}$

$t_{\text{total}} = t_1 + t_2 + t_3 = 4.4\text{ s} + 3.89\text{ s} + 1.1\text{ s} = 9.39\text{ s} \qquad t_B = 9.39\text{ s}$ ◀

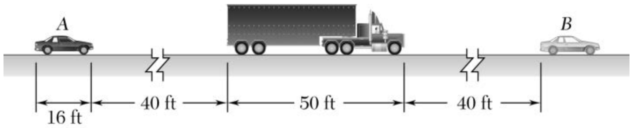
PROBLEM 11.73

Solve Problem 11.72, assuming that the driver of the car does not pay any attention to the speed limit while passing and concentrates on reaching position B and resuming a speed of 35 mi/h in the shortest possible time. What is the maximum speed reached? Draw the $v\!-\!t$ curve.

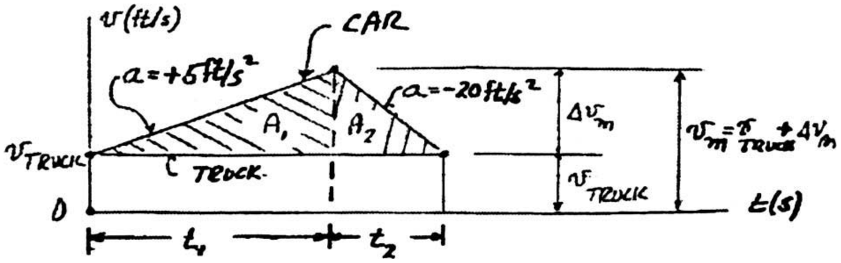
PROBLEM 11.72 A car and a truck are both traveling at the constant speed of 35 mi/h; the car is 40 ft behind the truck. The driver of the car wants to pass the truck, i.e., he wishes to place his car at B, 40 ft in front of the truck, and then resume the speed of 35 mi/h. The maximum acceleration of the car is 5 ft/s^2 and the maximum deceleration obtained by applying the brakes is 20 ft/s^2. What is the shortest time in which the driver of the car can complete the passing operation if he does not at any time exceed a speed of 50 mi/h? Draw the $v\!-\!t$ curve.



SOLUTION

Relative to truck, car must move a distance:

$$\Delta x = 16 + 40 + 50 + 40 = 146 \text{ ft}$$



$$\Delta v_m = 5t_1 = 20t_2; \quad t_2 = \frac{1}{4}t_1$$

$\Delta x = A_1 + A_2$:
$$146 \text{ ft} = \frac{1}{2}(\Delta v_m)(t_1 + t_2)$$

$$146 \text{ ft} = \frac{1}{2}(5t_1)\left(t_1 + \frac{1}{4}t_1\right)$$

$$t_1^2 = 46.72 \qquad t_1 = 6.835 \text{ s} \qquad t_2 = \frac{1}{4}t_1 = 1.709$$

$$t_{\text{total}} = t_1 + t_2 = 6.835 + 1.709$$

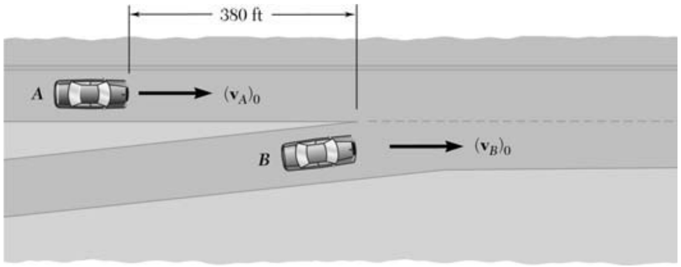
$t_B = 8.54$ s ◀

$$\Delta v_m = 5t_1 = 5(6.835) = 34.18 \text{ ft/s} = 23.3 \text{ mi/h}$$

Speed $v_{\text{total}} = 35$ mi/h, $v_m = 35 \text{ mi/h} + 23.3 \text{ mi/h}$

$v_m = 58.3$ mi/h ◀

If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.74

Car A is traveling on a highway at a constant speed $(v_A)_0 = 60$ mi/h, and is 380 ft from the entrance of an access ramp when car B enters the acceleration lane at that point at a speed $(v_B)_0 = 15$ mi/h. Car B accelerates uniformly and enters the main traffic lane after traveling 200 ft in 5 s. It then continues to accelerate at the same rate until it reaches a speed of 60 mi/h, which it then maintains. Determine the final distance between the two cars.

SOLUTION

<u>Given</u>: $(v_A)_0 = 60$ mi/h, $(v_B)_0 = 1.5$ mi/h; at $t = 0$,

$(x_A)_0 = -380$ ft, $(x_B)_0 = 0$; at $t = 5$ s,

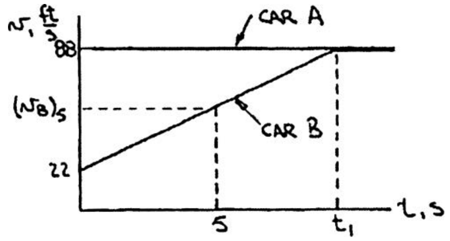
$x_B = 200$ ft; for 15 mi/h $< v_B \le 60$ mi/h,

$a_B =$ constant; for $v_B = 60$ mi/h,

$a_B = 0$

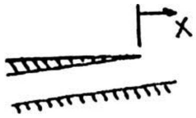
First note 60 mi/h = 88 ft/s

15 mi/h = 22 ft/s



The v–t curves of the two cars are then drawn as shown.

Using the coordinate system shown, we have



at $t = 5$ s, $x_B = 200$ ft: $$(5\text{ s})\left[\frac{22 + (v_B)_5}{2}\right]\text{ft/s} = 200\text{ ft}$$

or $$(v_B)_5 = 58\text{ ft/s}$$

Then, using similar triangles, we have

$$\frac{(88 - 22)\text{ ft/s}}{t_1} = \frac{(58 - 22)\text{ ft/s}}{5\text{ s}} (= a_B)$$

or $$t_1 = 9.1667\text{ s}$$

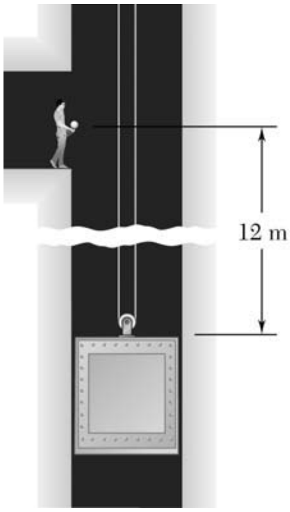
Finally, at $t = t_1$

$$x_{B/A} = x_B - x_A = \left[(9.1667\text{ s})\left(\frac{22 + 88}{2}\right)\text{ft/s}\right] - [-380\text{ ft} + (9.1667\text{ s})(88\text{ ft/s})]$$

or $$x_{B/A} = 77.5\text{ ft} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.75



An elevator starts from rest and moves upward, accelerating at a rate of 1.2 m/s^2 until it reaches a speed of 7.8 m/s, which it then maintains. Two seconds after the elevator begins to move, a man standing 12 m above the initial position of the top of the elevator throws a ball upward with an initial velocity of 20 m/s. Determine when the ball will hit the elevator.

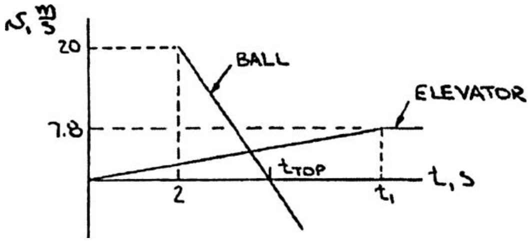
SOLUTION

<u>Given</u>: At $t = 0 \quad v_E = 0$; For $0 < v_E \le 7.8$ m/s, $a_E = 1.2$ m/s^2 $\uparrow$;

For $v_E = 7.8$ m/s, $a_E = 0$;

At $t = 2$ s, $v_B = 20$m/s $\uparrow$

The $v-t$ curves of the ball and the elevator are first drawn as shown. Note that the initial slope of the curve for the elevator is 1.2 m/s^2, while the slope of the curve for the ball is $-g\,(-9.81$ m/s$^2)$.



The time t_1 is the time when v_E reaches 7.8 m/s.

Thus, $$v_E = (0) + a_E t$$

or $$7.8 \text{ m/s} = (1.2 \text{ m/s}^2)t_1$$

or $$t_1 = 6.5 \text{ s}$$

The time t_{top} is the time at which the ball reaches the top of its trajectory.

Thus, $$v_B = (v_B)_0 - g(t-2)$$

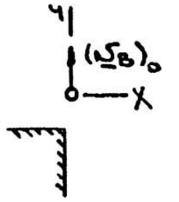
or $$0 = 20 \text{ m/s} - (9.81 \text{ m/s}^2)(t_{\text{top}} - 2) \text{ s}$$

or $$t_{\text{top}} = 4.0387 \text{ s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.75 (Continued)

Using the coordinate system shown, we have



$0 < t < t_1$: $\quad y_E = -12 \text{ m} + \left(\frac{1}{2} a_E t^2\right) \text{ m}$

At $t = t_{\text{top}}$: $\quad y_B = \frac{1}{2}(4.0387 - 2) \text{ s} \times (20 \text{ m/s})$

$$= 20.387 \text{ m}$$

and $\quad y_E = -12 \text{ m} + \frac{1}{2}(1.2 \text{ m/s}^2)(4.0387 \text{ s})^2$

$$= -2.213 \text{ m}$$

At $\quad t = [2 + 2(4.0387 - 2)] \text{ s} = 6.0774 \text{ s}, \ \ y_B = 0$

and at $t = t_1$, $\quad y_E = -12 \text{ m} + \frac{1}{2}(6.5 \text{ s})(7.8 \text{ m/s}) = 13.35 \text{ m}$

The ball hits the elevator $(y_B = y_E)$ when $t_{\text{top}} \le t \le t_1$.

For $t \ge t_{\text{top}}$: $\quad y_B = 20.387 \text{ m} - \left[\frac{1}{2} \text{ g } (t - t_{\text{top}})^2\right] \text{ m}$

Then,

when $\quad y_B = y_E$

$$20.387 \text{ m} - \frac{1}{2}(9.81 \text{ m/s}^2)(t - 4.0387)^2$$

$$= -12 \text{ m} + \frac{1}{2}(1.2 \text{ m/s}^2)(t \text{ s})^2$$

or $\quad 5.505t^2 - 39.6196t + 47.619 = 0$

Solving $\quad t = 1.525 \text{ s} \quad \text{and} \quad t = 5.67 \text{ s}$

Since 1.525 s is less than 2 s, $\quad t = 5.67 \text{ s}$ ◀

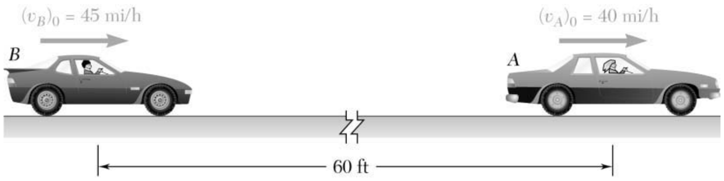
PROBLEM 11.76



Car *A* is traveling at 40 mi/h when it enters a 30 mi/h speed zone. The driver of car *A* decelerates at a rate of 16 ft/s^2 until reaching a speed of 30 mi/h, which she then maintains. When car *B*, which was initially 60 ft behind car *A* and traveling at a constant speed of 45 mi/h, enters the speed zone, its driver decelerates at a rate of 20 ft/s^2 until reaching a speed of 28 mi/h. Knowing that the driver of car *B* maintains a speed of 28 mi/h, determine (*a*) the closest that car *B* comes to car *A*, (*b*) the time at which car *A* is 70 ft in front of car *B*.

SOLUTION

Given: $(v_A)_0 = 40$ mi/h; For 30 mi/h $< v_A \le 40$ mi/h, $a_A = -16$ ft/s^2; For $v_A = 30$ mi/h, $a_A = 0$;

$(x_{A/B})_0 = 60$ ft; $(v_B)_0 = 45$ mi/h;

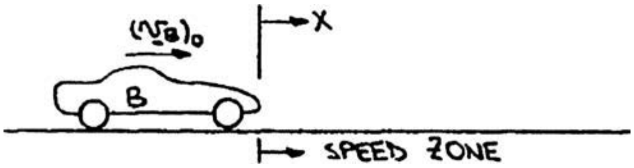
When $x_B = 0$, $a_B = -20$ ft/s^2;

For $v_B = 28$ mi/h, $a_B = 0$

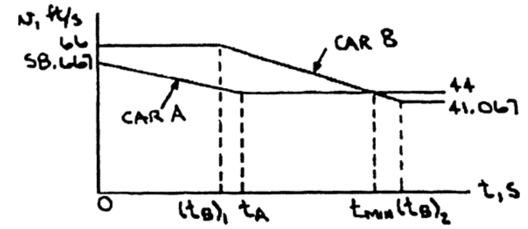
First note 40 mi/h = 58.667 ft/s 30 mi/h = 44 ft/s

45 mi/h = 66 ft/s 28 mi/h = 41.067 ft/s

At $t = 0$



The $v{-}t$ curves of the two cars are as shown.



At $t = 0$: Car *A* enters the speed zone.

$t = (t_B)_1$: Car *B* enters the speed zone.

$t = t_A$: Car *A* reaches its final speed.

$t = t_{min}$: $v_A = v_B$

$t = (t_B)_2$: Car *B* reaches its final speed.

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.76 (Continued)

(*a*) We have
$$a_A = \frac{(v_A)_{\text{final}} - (v_A)_0}{t_A}$$

or
$$-16 \text{ ft/s}^2 = \frac{(44 - 58.667) \text{ ft/s}}{t_A}$$

or
$$t_A = 0.91669 \text{ s}$$

Also
$$60 \text{ ft} = (t_B)_1 (v_B)_0$$

or
$$60 \text{ ft} = (t_B)_1 (66 \text{ ft/s}) \qquad \text{or} \qquad (t_B)_1 = 0.90909 \text{ s}$$

and
$$a_B = \frac{(v_B)_{\text{final}} - (v_B)_0}{(t_B)_2 - (t_B)_1}$$

or
$$-20 \text{ ft/s}^2 = \frac{(41.067 - 66) \text{ ft/s}}{[(t_B)_2 - 0.90909] \text{ s}}$$

Car *B* will continue to overtake car *A* while $v_B > v_A$. Therefore, $(x_{A/B})_{\min}$ will occur when $v_A = v_B$, which occurs for

$$(t_B)_1 < t_{\min} < (t_B)_2$$

For this time interval

$$v_A = 44 \text{ ft/s}$$
$$v_B = (v_B)_0 + a_B[t - (t_B)_1]$$

Then at $t = t_{\min}$:
$$44 \text{ ft/s} = 66 \text{ ft/s} + (-20 \text{ ft/s}^2)(t_{\min} - 0.90909) \text{ s}$$

or
$$t_{\min} = 2.00909 \text{ s}$$

Finally
$$(x_{A/B})_{\min} = (x_A)_{t_{\min}} - (x_B)_{t_{\min}}$$
$$= \left\{ t_A \left[\frac{(v_A)_0 + (v_A)_{\text{final}}}{2} \right] + (t_{\min} - t_A)(v_A)_{\text{final}} \right\}$$
$$- \left\{ (x_B)_0 + (t_B)_1 (v_B)_0 + [t_{\min} - (t_B)_1] \left[\frac{(v_B)_0 + (v_A)_{\text{final}}}{2} \right] \right\}$$
$$= \left[(0.91669 \text{ s}) \left(\frac{58.667 + 44}{2} \right) \text{ft/s} + (2.00909 - 0.91669) \text{ s} \times (44 \text{ ft/s}) \right]$$
$$- \left[-60 \text{ ft} + (0.90909 \text{ s})(66 \text{ ft/s}) + (2.00909 - 0.90909) \text{ s} \times \left(\frac{66 + 44}{2} \right) \text{ft/s} \right]$$
$$= (47.057 + 48.066) \text{ ft} - (-60 + 60.000 + 60.500) \text{ ft}$$
$$= 34.623 \text{ ft}$$

or $(x_{A/B})_{\min} = 34.6 \text{ ft}$ ◀

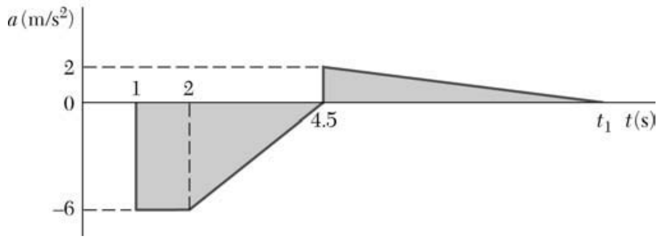
PROBLEM 11.78



A car is traveling at a constant speed of 54 km/h when its driver sees a child run into the road. The driver applies her brakes until the child returns to the sidewalk and then accelerates to resume her original speed of 54 km/h; the acceleration record of the car is shown in the figure. Assuming $x = 0$ when $t = 0$, determine (*a*) the time t_1 at which the velocity is again 54 km/h, (*b*) the position of the car at that time, (*c*) the average velocity of the car during the interval $1\text{ s} \le t \le t_1$.

SOLUTION

Given: At $t = 0, \quad x = 0, \quad v = 54\text{ km/h};$

For $t = t_1, \quad v = 54\text{ km/h}$

First note $54\text{ km/h} = 15\text{ m/s}$

(*a*) We have $v_b = v_a + (\text{area under } a\text{–}t \text{ curve from } t_a \text{ to } t_b)$

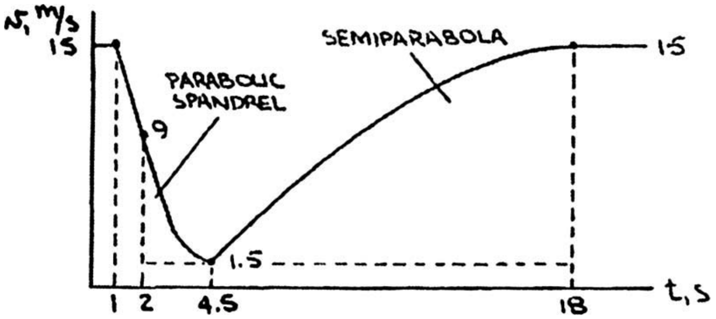
Then at $t = 2\text{ s}: \quad v = 15 - (1)(6) = 9\text{ m/s}$

$$t = 4.5\text{ s}: \quad v = 9 - \frac{1}{2}(2.5)(6) = 1.5\text{ m/s}$$

$$t = t_1: \quad 15 = 1.5 + \frac{1}{2}(t_1 - 4.5)(2)$$

or $t_1 = 18.00\text{ s}$ ◀

(*b*) Using the above values of the velocities, the v–t curve is drawn as shown.



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.78 (Continued)

Now x at $t = 18$ s

$$x_{18} = 0 + \Sigma\,(\text{area under the } v\text{–}t \text{ curve from } t = 0 \text{ to } t = 18\text{ s})$$

$$= (1\text{ s})(15\text{ m/s}) + (1\text{ s})\left(\frac{15+9}{2}\right)\text{m/s}$$

$$+\left[(2.5\text{ s})(1.5\text{ m/s}) + \frac{1}{3}(2.5\text{ s})(7.5\text{ m/s})\right]$$

$$+\left[(13.5\text{ s})(1.5\text{ m/s}) + \frac{2}{3}(13.5\text{ s})(13.5\text{ m/s})\right]$$

$$= [15 + 12 + (3.75 + 6.25) + (20.25 + 121.50)]\text{ m}$$

$$= 178.75\text{ m}$$

or $x_{18} = 178.8$ m ◀

(*c*) First note $x_1 = 15$ m

$$x_{18} = 178.75\text{ m}$$

Now $$v_{\text{ave}} = \frac{\Delta x}{\Delta t} = \frac{(178.75 - 15)\text{ m}}{(18 - 1)\text{ s}} = 9.6324\text{ m/s}$$

or $v_{\text{ave}} = 34.7$ km/h ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 11.79

An airport shuttle train travels between two terminals that are 1.6 mi apart. To maintain passenger comfort, the acceleration of the train is limited to ± 4 ft/s^2, and the jerk, or rate of change of acceleration, is limited to ± 0.8 ft/s^2 per second. If the shuttle has a maximum speed of 20 mi/h, determine (*a*) the shortest time for the shuttle to travel between the two terminals, (*b*) the corresponding average velocity of the shuttle.

SOLUTION

Given: $x_{max} = 1.6 \text{ mi}; \quad |a_{max}| = 4 \text{ ft/s}^2$

$$\left|\left(\frac{da}{dt}\right)_{max}\right| = 0.8 \text{ ft/s}^2\text{/s}; \quad v_{max} = 20 \text{ mi/h}$$

First note $20 \text{ mi/h} = 29.333 \text{ ft/s}$

$$1.6 \text{ mi} = 8448 \text{ ft}$$

(*a*) To obtain t_{min}, the train must accelerate and decelerate at the maximum rate to maximize the time for which $v = v_{max}$. The time Δt required for the train to have an acceleration of 4 ft/s^2 is found from

$$\left(\frac{da}{dt}\right)_{max} = \frac{a_{max}}{\Delta t}$$

or $$\Delta t = \frac{4 \text{ ft/s}^2}{0.8 \text{ ft/s}^2\text{/s}}$$

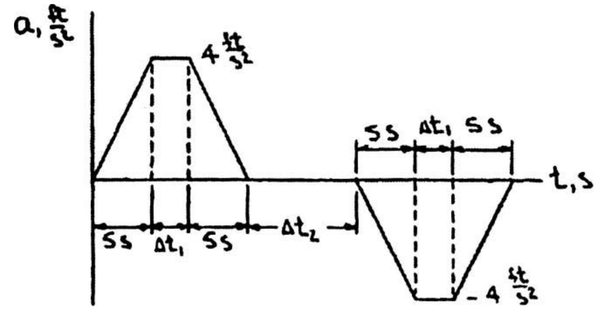
or $$\Delta t = 5 \text{ s}$$

Now,

after 5 s, the speed of the train is $$v_5 = \frac{1}{2}(\Delta t)(a_{max}) \qquad \left(\text{since } \frac{da}{dt} = \text{constant}\right)$$

or $$v_5 = \frac{1}{2}(5 \text{ s})(4 \text{ ft/s}^2) = 10 \text{ ft/s}$$

Then, since $v_5 < v_{max}$, the train will continue to accelerate at 4 ft/s^2 until $v = v_{max}$. The a–t curve must then have the shape shown. Note that the magnitude of the slope of each inclined portion of the curve is 0.8 ft/s^2/s.



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Now at $t = (10 + \Delta t_1)$ s, $v = v_{max}$:

$$2\left[\frac{1}{2}(5\text{ s})(4\text{ ft/s}^2)\right] + (\Delta t_1)(4\text{ ft/s}^2) = 29.333\text{ ft/s}$$

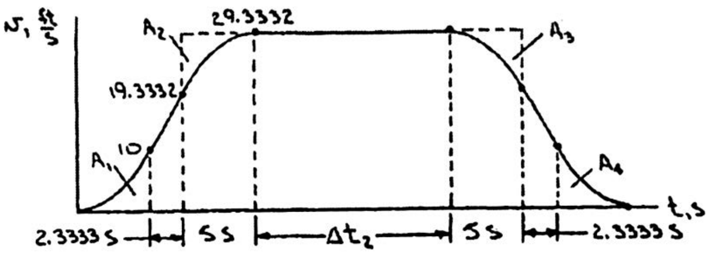
or $\Delta t_1 = 2.3333$ s

Then at $t = 5$ s: $v = 0 + \frac{1}{2}(5)(4) = 10$ ft/s

$t = 7.3333$ s: $v = 10 + (2.3333)(4) = 19.3332$ ft/s

$t = 12.3333$ s: $v = 19.3332 + \frac{1}{2}(5)(4) = 29.3332$ ft/s

Using symmetry, the v–t curve is then drawn as shown.



Noting that $A_1 = A_2 = A_3 = A_4$ and that the area under the v–t curve is equal to x_{max}, we have

$$2\left[(2.3333\text{ s})\left(\frac{10 + 19.3332}{2}\right)\text{ft/s}\right]$$
$$+ (10 + \Delta t_2)\text{ s} \times (29.3332\text{ ft/s}) = 8448\text{ ft}$$

or $\Delta t_2 = 275.67$ s

Then $t_{min} = 4(5\text{ s}) + 2(2.3333\text{ s}) + 275.67\text{ s}$

$= 300.34$ s

or $t_{min} = 5.01$ min ◀

(*b*) We have $v_{ave} = \dfrac{\Delta x}{\Delta t} = \dfrac{1.6\text{ mi}}{300.34\text{ s}} \times \dfrac{3600\text{ s}}{1\text{ h}}$

or $v_{ave} = 19.18$ mi/h ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.80

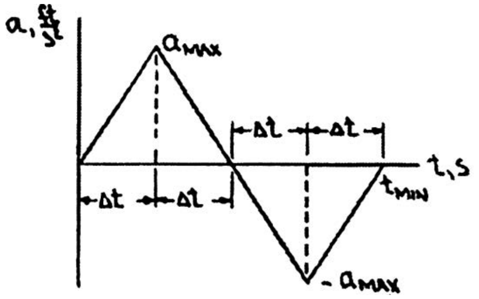
During a manufacturing process, a conveyor belt starts from rest and travels a total of 1.2 ft before temporarily coming to rest. Knowing that the jerk, or rate of change of acceleration, is limited to ±4.8 ft/s^2 per second, determine (*a*) the shortest time required for the belt to move 1.2 ft, (*b*) the maximum and average values of the velocity of the belt during that time.

SOLUTION

Given: At $t = 0, \quad x = 0, \quad v = 0; \quad x_{max} = 1.2$ ft;

when $x = x_{max}, \quad v = 0; \quad \left|\left(\frac{da}{dt}\right)_{max}\right| = 4.8 \text{ ft/s}^2$

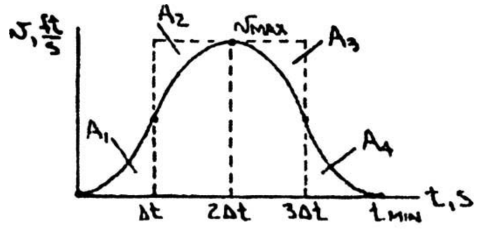
(*a*) Observing that v_{max} must occur at $t = \frac{1}{2}t_{min}$, the $a\text{–}t$ curve must have the shape shown. Note that the magnitude of the slope of each portion of the curve is 4.8 ft/s^2/s.



We have at $t = \Delta t$: $v = 0 + \frac{1}{2}(\Delta t)(a_{max}) = \frac{1}{2}a_{max}\Delta t$

$t = 2\Delta t$: $v_{max} = \frac{1}{2}a_{max}\Delta t + \frac{1}{2}(\Delta t)(a_{max}) = a_{max}\Delta t$

Using symmetry, the $v\text{–}t$ is then drawn as shown.



Noting that $A_1 = A_2 = A_3 = A_4$ and that the area under the $v\text{–}t$ curve is equal to x_{max}, we have

$$(2\Delta t)(v_{max}) = x_{max}$$

$$v_{max} = a_{max}\Delta t \Rightarrow 2a_{max}\Delta t^2 = x_{max}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.81

Two seconds are required to bring the piston rod of an air cylinder to rest; the acceleration record of the piston rod during the 2 s is as shown. Determine by approximate means (*a*) the initial velocity of the piston rod, (*b*) the distance traveled by the piston rod as it is brought to rest.

SOLUTION

Given: $a\text{–}t$ curve; at $t = 2$ s, $v = 0$

1. The $a\text{–}t$ curve is first approximated with a series of rectangles, each of width $\Delta t = 0.25$ s. The area $(\Delta t)(a_{\text{ave}})$ of each rectangle is approximately equal to the change in velocity Δv for the specified interval of time. Thus,

$$\Delta v \cong a_{\text{ave}}\ \Delta t$$

where the values of a_{ave} and Δv are given in columns 1 and 2, respectively, of the following table.

2. Now $$v(2) = v_0 + \int_0^2 a\, dt = 0$$

and approximating the area $\int_0^2 a\, dt$ under the $a\text{–}t$ curve by $\Sigma a_{\text{ave}}\Delta t \approx \Sigma\Delta v$, the initial velocity is then equal to

$$v_0 = -\Sigma\Delta v$$

Finally, using

$$v_2 = v_1 + \Delta v_{12}$$

where Δv_{12} is the change in velocity between times t_1 and t_2, the velocity at the end of each 0.25 interval can be computed; see column 3 of the table and the $v\text{–}t$ curve.

3. The $v\text{–}t$ curve is then approximated with a series of rectangles, each of width 0.25 s. The area $(\Delta t)(v_{\text{ave}})$ of each rectangle is approximately equal to the change in position Δx for the specified interval of time. Thus

$$\Delta x \approx v_{\text{ave}}\Delta t$$

where v_{ave} and Δx are given in columns 4 and 5, respectively, of the table.

PROBLEM 11.82

The acceleration record shown was obtained during the speed trials of a sports car. Knowing that the car starts from rest, determine by approximate means (*a*) the velocity of the car at $t = 8$ s, (*b*) the distance the car has traveled at $t = 20$ s.

SOLUTION

Given: a–t curve; at $t = 0,\ x = 0,\ v = 0$

1. The a–t curve is first approximated with a series of rectangles, each of width $\Delta t = 2$ s. The area $(\Delta t)(a_{\text{ave}})$ of each rectangle is approximately equal to the change in velocity Δv for the specified interval of time. Thus,

$$\Delta v \cong a_{\text{ave}}\ \Delta t$$

where the values of a_{ave} and Δv are given in columns 1 and 2, respectively, of the following table.

2. Noting that $v_0 = 0$ and that

$$v_2 = v_1 + \Delta v_{12}$$

where Δv_{12} is the change in velocity between times t_1 and t_2, the velocity at the end of each 2 s interval can be computed; see column 3 of the table and the v–t curve.

3. The v–t curve is next approximated with a series of rectangles, each of width $\Delta t = 2$ s. The area $(\Delta t)(v_{\text{ave}})$ of each rectangle is approximately equal to the change in position Δx for the specified interval of time.

Thus, $$\Delta x \cong v_{\text{ave}}\ \Delta t$$

where v_{ave} and Δx are given in columns 4 and 5, respectively, of the table.

4. With $x_0 = 0$ and noting that

$$x_2 = x_1 + \Delta x_{12}$$

where Δx_{12} is the change in position between times t_1 and t_2, the position at the end of each 2 s interval can be computed; see column 6 of the table and the x–t curve.

PROBLEM 11.83

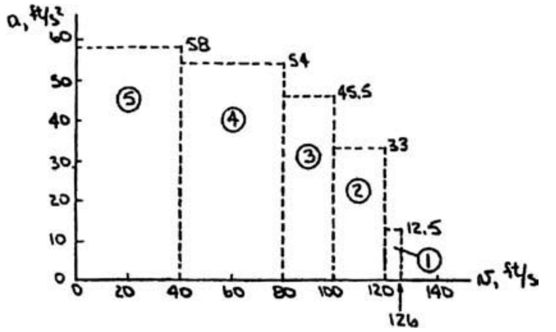
A training airplane has a velocity of 126 ft/s when it lands on an aircraft carrier. As the arresting gear of the carrier brings the airplane to rest, the velocity and the acceleration of the airplane are recorded; the results are shown (solid curve) in the figure. Determine by approximate means (*a*) the time required for the airplane to come to rest, (*b*) the distance traveled in that time.

SOLUTION

Given: $a-v$ curve:

$$v_0 = 126 \text{ ft/s}$$

The given curve is approximated by a series of uniformly accelerated motions (the horizontal dashed lines on the figure).



For uniformly accelerated motion

$$v_2^2 = v_1^2 + 2a(x_2 - x_1)$$

$$v_2 = v_1 + a(t_2 - t_1)$$

or

$$\Delta x = \frac{v_2^2 - v_1^2}{2a}$$

$$\Delta t = \frac{v_2 - v_1}{a}$$

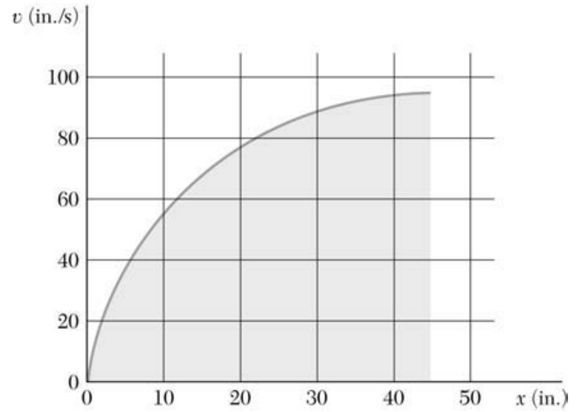
For the five regions shown above, we have

Region	v_1, ft/s	v_2, ft/s	a, ft/s^2	Δx, ft	Δt, s
1	126	120	−12.5	59.0	0.480
2	120	100	−33	66.7	0.606
3	100	80	−45.5	39.6	0.440
4	80	40	−54	44.4	0.741
5	40	0	−58	13.8	0.690
Σ				223.5	2.957

(*a*) From the table, when $v = 0$ $\quad t = 2.96 \text{ s}$ ◀

(*b*) From the table and assuming $x_0 = 0$, when $v = 0$ $\quad x = 224 \text{ ft}$ ◀

If you are a student using this Manual, you are using it without permission.*

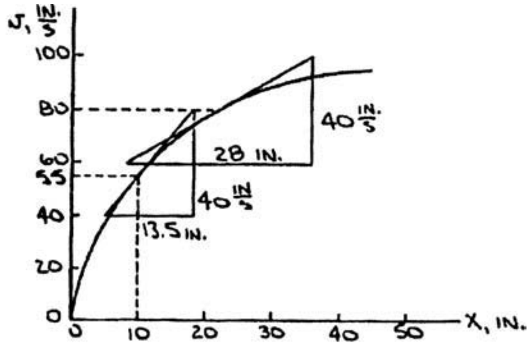


PROBLEM 11.84

Shown in the figure is a portion of the experimentally determined $v-x$ curve for a shuttle cart. Determine by approximate means the acceleration of the cart (*a*) when $x = 10$ in., (*b*) when $v = 80$ in./s.

SOLUTION

Given: $v-x$ curve



First note that the slope of the above curve is $\frac{dv}{dx}$. Now

$$a = v\frac{dv}{dx}$$

(*a*) When $\quad x = 10 \text{ in.}, \quad v = 55 \text{ in./s}$

Then $$a = 55 \text{ in./s}\left(\frac{40 \text{ in./s}}{13.5 \text{ in.}}\right)$$

or $$a = 163.0 \text{ in./s}^2 \blacktriangleleft$$

(*b*) When $v = 80$ in./s, we have

$$a = 80 \text{ in./s}\left(\frac{40 \text{ in./s}}{28 \text{ in.}}\right)$$

or $$a = 114.3 \text{ in./s}^2 \blacktriangleleft$$

Note: To use the method of measuring the subnormal outlined at the end of Section 11.8, it is necessary that the same scale be used for the *x* and *v* axes (e.g., 1 in. = 50 in., 1 in. = 50 in./s). In the above solution, Δv and Δx were measured directly, so different scales could be used.

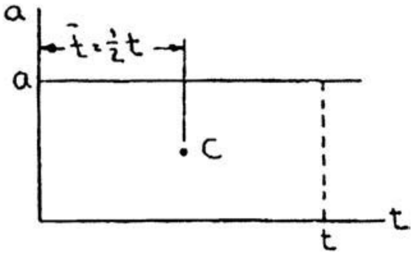
PROBLEM 11.85

Using the method of Section 11.8, derive the formula $x = x_0 + v_0 t + \frac{1}{2}at^2$ for the position coordinate of a particle in uniformly accelerated rectilinear motion.

SOLUTION

The $a\text{–}t$ curve for uniformly accelerated motion is as shown.



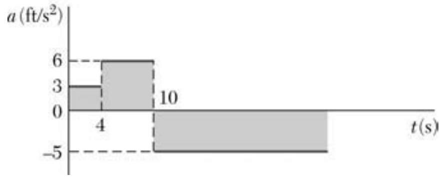
Using Eq. (11.13), we have

$$x = x_0 + v_0 t + (\text{area under } a\text{–}t \text{ curve})\,(t - \bar{t})$$

$$= x_0 + v_0 t + (t \times a)\left(t - \frac{1}{2}t\right)$$

$$= x_0 + v_0 t + \frac{1}{2}at^2 \qquad \text{Q.E.D.}$$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

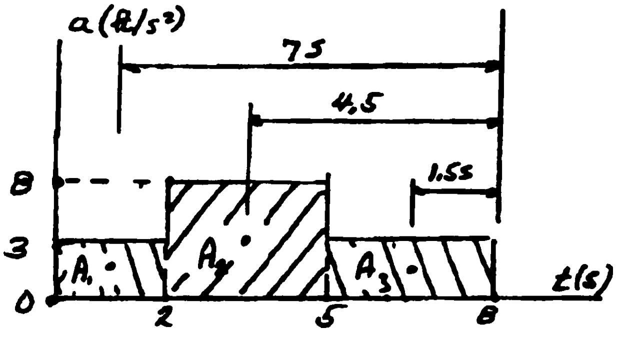


PROBLEM 11.86

Using the method of Section 11.8 determine the position of the particle of Problem 11.61 when $t = 8$ s.

PROBLEM 11.61 A particle moves in a straight line with the acceleration shown in the figure. Knowing that it starts from the origin with $v_0 = -14$ ft/s, plot the v–t and x–t curves for $0 < t < 15$ s and determine (*a*) the maximum value of the velocity of the particle, (*b*) the maximum value of its position coordinate.

SOLUTION



$x_0 = 0$

$v_0 = -14$ ft/s

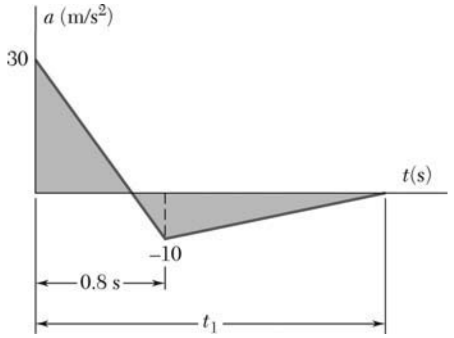
when $t = 8$ s:

$$x = x_0 + v_0 t + \Sigma A(t_1 - t)$$

$$= 0 - (14 \text{ ft/s})(8 \text{ s}) + [(3 \text{ ft/s}^2)(2 \text{ s})](7 \text{ s}) + [(8 \text{ ft/s}^2)(3 \text{ s})](4.5 \text{ s}) + [(3 \text{ ft/s})(3 \text{ s})](1.5 \text{ s})$$

$x_8 = -112 \text{ ft} + 42 \text{ ft} + 108 \text{ ft} + 13.5 \text{ ft}$ $\qquad$ $x_8 = 51.5$ ft ◀

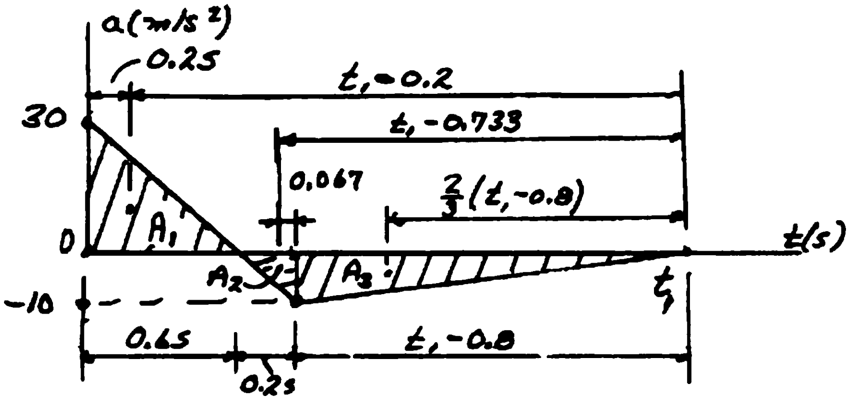
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.87

The acceleration of an object subjected to the pressure wave of a large explosion is defined approximately by the curve shown. The object is initially at rest and is again at rest at time t_1. Using the method of section 11.8, determine (*a*) the time t_1, (b) the distance through which the object is moved by the pressure wave.

SOLUTION



(*a*) Since $v = 0$ when $t = 0$ and when $t = t_1$ the change in v between $t = 0$ and $t = t_1$ is zero.

Thus, area under *a*–*t* curve is zero

$$A_1 + A_2 + A_3 = 0$$

$$\frac{1}{2}(30)(0.6) + \frac{1}{2}(-10)(0.2) + \frac{1}{2}(-10)(t_1 - 0.8) = 0$$

$$9 - 1 - 5t_1 + 4 = 0$$

$t_1 = 2.40$ s ◀

(*b*) Position when $t = t_1 = 2.4$ s

$$x = x_0 + v_0 t_1 + A_1(t_1 - 0.2) + A_2(t_1 - 0.733) + A_3\left(\frac{2}{3}\right)(t_1 - 0.8)$$

$$= 0 + 0 + (9)(2.4 - 0.2) + (-1)(2.4 - 0.733) + \left[\frac{1}{2}(-10)(2.4 - 0.8)\right]\frac{2}{3}(2.4 - 0.8)$$

$$= 19.8 \text{ m} - 1.667 \text{ m} - 8.533 \text{ m}$$

$x = 9.60$ m ◀

PROBLEM 11.88

For the particle of Problem 11.63, draw the $a\!-\!t$ curve and determine, using the method of Section 11.8, (*a*) the position of the particle when $t = 52$ s, (*b*) the maximum value of its position coordinate.

PROBLEM 11.63 A particle moves in a straight line with the velocity shown in the figure. Knowing that $x = -540$ m at $t = 0$, (*a*) construct the $a\!-\!t$ and $x\!-\!t$ curves for $0 < t < 50$ s, and determine (*b*) the total distance traveled by the particle when $t = 50$ s, (*c*) the two times at which $x = 0$.

SOLUTION

We have $$a = \frac{dv}{dt}$$

where $\frac{dv}{dt}$ is the slope of the $v\!-\!t$ curve. Then

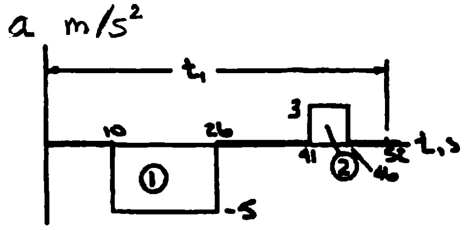
from $t = 0$ to $t = 10$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 10$ s to $t = 26$ s: $a = \dfrac{-20-60}{26-10} = -5 \text{ m/s}^2$

$t = 26$ s to $t = 41$ s: $v = \text{constant} \Rightarrow a = 0$

$t = 41$ s to $t = 46$ s: $a = \dfrac{-5-(-20)}{46-41} = 3 \text{ m/s}^2$

$t > 46$ s: $v = \text{constant} \Rightarrow a = 0$



The $a\!-\!t$ curve is then drawn as shown.

(*a*) From the discussion following Eq. (11.13),

we have $$x = x_0 + v_0 t_1 + \Sigma A(t_1 - \overline{t})$$

where A is the area of a region and $\overline{t}$ is the distance to its centroid. Then, for $t_1 = 52$ s

$$\begin{aligned} x &= -540 \text{ m} + (60 \text{ m/s})(52 \text{ s}) + \{-[(16 \text{ s})(5 \text{ m/s}^2)](52-18) \text{ s} \\ &\quad + [(5 \text{ s})(3 \text{ m/s}^2)](52-43.5)\text{s}\} \\ &= [-540 + (3120) + (-2720 + 127.5)] \text{ m} \end{aligned}$$

or $x = -12.50$ m ◀

If you are a student using this Manual, you are using it without permission.*

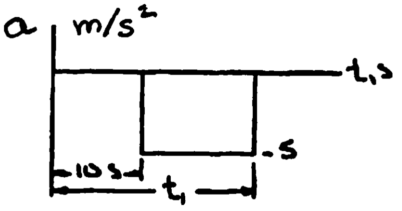
PROBLEM 11.88 (Continued)

(*b*) Noting that x_{max} occurs when $v = 0\left(\frac{dx}{dt} = 0\right)$, it is seen from the *v–t* curve that x_{max} occurs for $10\text{ s} < t < 26\text{ s}$. Although similar triangles could be used to determine the time at which $x = x_{max}$ (see the solution to Problem 11.63), the following method will be used.

For $10\text{ s} < t_1 < 26\text{ s}$, we have

$$x = -540 + 60t_1 - [(t_1 - 10)(5)]\left[\frac{1}{2}(t_1 - 10)\right]\text{ m}$$

$$= -540 + 60t_1 - \frac{5}{2}(t_1 - 10)^2$$



When $x = x_{max}$: $\quad \frac{dx}{dt} = 60 - 5(t_1 - 10) = 0$

or $\quad (t_1)_{x_{max}} = 22\text{ s}$

Then $\quad x_{max} = -540 + 60(22) - \frac{5}{2}(22 - 10)^2$

or $\quad x_{max} = 420\text{ m}$ ◀

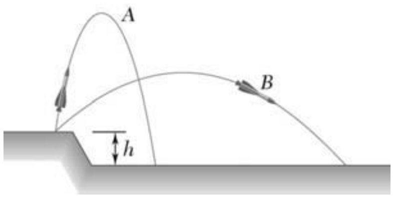
PROBLEM 11.CQ3



Two model rockets are fired simultaneously from a ledge and follow the trajectories shown. Neglecting air resistance, which of the rockets will hit the ground first?

(*a*) *A*

(*b*) *B*

(*c*) They hit at the same time.

(*d*) The answer depends on *h*.

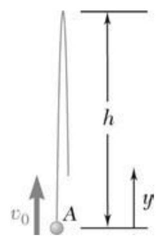
SOLUTION

The motion in the vertical direction depends on the initial velocity in the *y*-direction. Since *A* has a larger initial velocity in this direction it will take longer to hit the ground.

Answer: (*b*) ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.CQ4



Ball A is thrown straight up. Which of the following statements about the ball are true at the highest point in its path?

(*a*) The velocity and acceleration are both zero.

(*b*) The velocity is zero, but the acceleration is not zero.

(*c*) The velocity is not zero, but the acceleration is zero.

(*d*) Neither the velocity nor the acceleration are zero.

SOLUTION

At the highest point the velocity is zero. The acceleration is never zero.

Answer: (*b*) ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.CQ5

Ball A is thrown straight up with an initial speed v_0 and reaches a maximum elevation h before falling back down. When A reaches its maximum elevation, a second ball is thrown straight upward with the same initial speed v_0. At what height, y, will the balls cross paths?

(*a*) $y = h$

(*b*) $y > h/2$

(*c*) $y = h/2$

(*d*) $y < h/2$

(*e*) $y = 0$

SOLUTION

When the ball is thrown up in the air it will be constantly slowing down until it reaches its apex, at which point it will have a speed of zero. So, the time it will take to travel the last half of the distance to the apex will be longer than the time it takes for the first half. This same argument can be made for the ball falling from the maximum elevation. It will be speeding up, so the first half of the distance will take longer than the second half. Therefore, the balls should cross above the half-way point.

PROBLEM 11.89

A ball is thrown so that the motion is defined by the equations $x = 5t$ and $y = 2 + 6t - 4.9t^2$, where x and y are expressed in meters and t is expressed in seconds. Determine (*a*) the velocity at $t = 1$ s, (*b*) the horizontal distance the ball travels before hitting the ground.

SOLUTION

Units are meters and seconds.

Horizontal motion: $$v_x = \frac{dx}{dt} = 5$$

Vertical motion: $$v_y = \frac{dy}{dt} = 6 - 9.8t$$

(*a*) Velocity at $t = 1$ s.

$$v_x = 5$$
$$v_y = 6 - 9.8 = -3.8$$

$$v = \sqrt{v_x^2 + v_y^2} = \sqrt{5^2 + 3.8^2} = 6.28 \text{ m/s}$$

$$\tan\theta = \frac{v_y}{v_x} = \frac{-3.8}{5} \qquad \theta = -37.2°$$

$v = 6.28$ m/s ⦬ 37.2° ◀

(*b*) Horizontal distance: $(y = 0)$

$$y = 2 + 6t - 4.9t^2$$
$$t = 1.4971 \text{ s}$$
$$x = (5)(1.4971) = 7.4856 \text{ m}$$

$x = 7.49$ m ◀

PROBLEM 11.91

The motion of a vibrating particle is defined by the position vector $\mathbf{r} = (4\sin \pi t)\mathbf{i} - (\cos 2\pi t)\mathbf{j},$ where r is expressed in inches and t in seconds. (a) Determine the velocity and acceleration when $t = 1$ s. (b) Show that the path of the particle is parabolic.

SOLUTION

$$\mathbf{r} = (4\sin \pi t)\mathbf{i} - (\cos 2\pi t)\mathbf{j}$$
$$\mathbf{v} = (4\pi \cos \pi t)\mathbf{i} + (2\pi \sin 2\pi t)\mathbf{j}$$
$$\mathbf{a} = -(4\pi^2 \sin \pi t)\mathbf{i} + (4\pi^2 \cos 2\pi t)\mathbf{j}$$

(a) When $t = 1$ s:

$$\mathbf{v} = (4\pi \cos \pi)\mathbf{i} + (2\pi \sin 2\pi)\mathbf{j}$$

$\mathbf{v} = -(4\pi \text{ in/s})\mathbf{i}$ ◀

$$\mathbf{a} = -(4\pi^2 \sin \pi)\mathbf{i} - (4\pi^2 \cos \pi)\mathbf{j}$$

$\mathbf{a} = -(4\pi^2 \text{in/s}^2)\mathbf{j}$ ◀

(b) Path of particle:

Since $\mathbf{r} = x\mathbf{i} + y\,\mathbf{j};$ $\quad x = 4\sin \pi t,$ $\quad y = -\cos 2\pi t$

Recall that $\cos 2\theta = 1 - 2\sin^2 \theta$ and write

$$y = -\cos 2\pi t = -(1 - 2\sin^2 \pi t) \qquad (1)$$

But since $x = 4\sin \pi t$ or $\sin \pi t = \frac{1}{4}x,$ Eq.(1) yields

$$y = -\left[1 - 2\left(\frac{1}{4}x\right)^2\right]$$

$y = \frac{1}{8}x^2 - 1$ (Parabola) ◀

PROBLEM 11.95

The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$. Determine the magnitudes of the velocity and acceleration of the particle. (The space curve described by the particle is a conic helix.)

SOLUTION

We have $$\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$$

Then $$\mathbf{v} = \frac{d\mathbf{r}}{dt} = R(\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + c\mathbf{j} + R(\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}$$

and
$$\begin{aligned}
\mathbf{a} &= \frac{d\mathbf{v}}{dt} \\
&= R(-\omega_n\sin\omega_n t - \omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t)\mathbf{i} \\
&\quad + R(\omega_n\cos\omega_n t + \omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t)\mathbf{k} \\
&= R(-2\omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t)\mathbf{i} + R(2\omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t)\mathbf{k}
\end{aligned}$$

Now
$$\begin{aligned}
v^2 &= v_x^2 + v_y^2 + v_z^2 \\
&= [R(\cos\omega_n t - \omega_n t\sin\omega_n t)]^2 + (c)^2 + [R(\sin\omega_n t + \omega_n t\cos\omega_n t)]^2 \\
&= R^2\Big[\left(\cos^2\omega_n t - 2\omega_n t\sin\omega_n t\cos\omega_n t + \omega_n^2 t^2\sin^2\omega_n t\right) \\
&\quad + \left(\sin^2\omega_n t + 2\omega_n t\sin\omega_n t\cos\omega_n t + \omega_n^2 t^2\cos^2\omega_n t\right)\Big] + c^2 \\
&= R^2\left(1 + \omega_n^2 t^2\right) + c^2
\end{aligned}$$

or $$v = \sqrt{R^2\left(1 + \omega_n^2 t^2\right) + c^2} \blacktriangleleft$$

Also,
$$\begin{aligned}
a^2 &= a_x^2 + a_y^2 + a_z^2 \\
&= \left[R\left(-2\omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t\right)\right]^2 + (0)^2 \\
&\quad + \left[R\left(2\omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t\right)\right]^2 \\
&= R^2\Big[\left(4\omega_n^2\sin^2\omega_n t + 4\omega_n^3 t\sin\omega_n t\cos\omega_n t + \omega_n^4 t^2\cos^2\omega_n t\right) \\
&\quad + \left(4\omega_n^2\cos^2\omega_n t - 4\omega_n^3 t\sin\omega_n t\cos\omega_n t + \omega_n^4 t^2\sin^2\omega_n t\right)\Big] \\
&= R^2\left(4\omega_n^2 + \omega_n^4 t^2\right)
\end{aligned}$$

or $$a = R\omega_n\sqrt{4 + \omega_n^2 t^2} \blacktriangleleft$$

PROBLEM 11.96

The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (At\cos t)\mathbf{i} + (A\sqrt{t^2+1})\mathbf{j} + (Bt\sin t)\mathbf{k}$, where r and t are expressed in feet and seconds, respectively. Show that the curve described by the particle lies on the hyperboloid $(y/A)^2 - (x/A)^2 - (z/B)^2 = 1$. For $A = 3$ and $B = 1$, determine (a) the magnitudes of the velocity and acceleration when $t = 0$, (b) the smallest nonzero value of t for which the position vector and the velocity are perpendicular to each other.

SOLUTION

We have $$\mathbf{r} = (At\cos t)\mathbf{i} + (A\sqrt{t^2+1})\mathbf{j} + (Bt\sin t)\mathbf{k}$$

or $$x = At\cos t \quad y = A\sqrt{t^2+1} \quad z = Bt\sin t$$

Then $$\cos t = \frac{x}{At} \qquad \sin t = \frac{z}{Bt} \qquad t^2 = \left(\frac{y}{A}\right)^2 - 1$$

Now $$\cos^2 t + \sin^2 t = 1 \quad \Rightarrow \quad \left(\frac{x}{At}\right)^2 + \left(\frac{z}{Bt}\right)^2 = 1$$

or $$t^2 = \left(\frac{x}{A}\right)^2 + \left(\frac{z}{B}\right)^2$$

Then $$\left(\frac{y}{A}\right)^2 - 1 = \left(\frac{x}{A}\right)^2 + \left(\frac{z}{B}\right)^2$$

or $$\left(\frac{y}{A}\right)^2 - \left(\frac{x}{A}\right)^2 - \left(\frac{z}{B}\right)^2 = 1 \qquad \text{Q.E.D.}$$ ◀

(a) With $A = 3$ and $B = 1$, we have

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = 3(\cos t - t\sin t)\mathbf{i} + 3\frac{t}{\sqrt{t^2+1}}\mathbf{j} + (\sin t + t\cos t)\mathbf{k}$$

and $$\mathbf{a} = \frac{d\mathbf{v}}{dt} = 3(-\sin t - \sin t - t\cos t)\mathbf{i} + 3\frac{\sqrt{t^2+1} - t\left(\frac{t}{\sqrt{t^2+1}}\right)}{(t^2+1)}\mathbf{j}$$
$$+ (\cos t + \cos t - t\sin t)\mathbf{k}$$
$$= -3(2\sin t + t\cos t)\mathbf{i} + 3\frac{1}{(t^2+1)^{3/2}}\mathbf{j} + (2\cos t - t\sin t)\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.96 (Continued)

At $t = 0$: $\mathbf{v} = 3(1-0)\mathbf{i} + (0)\mathbf{j} + (0)\mathbf{k}$

$$v = \sqrt{v_x^2 + v_y^2 + v_z^2}$$

or $v = 3 \text{ ft/s}$ ◀

and $\mathbf{a} = -3(0)\mathbf{i} + 3(1)\mathbf{j} + (2-0)\mathbf{k}$

Then $a^2 = (0)^2 + (3)^2 + (2)^2 = 13$

or $a = 3.61 \text{ ft/s}^2$ ◀

(*b*) If **r** and **v** are perpendicular, $\mathbf{r} \cdot \mathbf{v} = 0$

$$[(3t \cos t)\mathbf{i} + (3\sqrt{t^2+1})\mathbf{j} + (t \sin t)\mathbf{k}] \cdot [3(\cos t - t \sin t)\mathbf{i} + \left(3\frac{t}{\sqrt{t^2+1}}\right)\mathbf{j} + (\sin t + t \cos t)\mathbf{k}] = 0$$

or $$(3t \cos t)[3(\cos t - t \sin t)] + (3\sqrt{t^2+1})\left(3\frac{t}{\sqrt{t^2+1}}\right) + (t \sin t)(\sin t + t \cos t) = 0$$

Expanding $$(9t \cos^2 t - 9t^2 \sin t \cos t) + (9t) + (t \sin^2 t + t^2 \sin t \cos t) = 0$$

or (with $t \neq 0$) $$10 + 8 \cos^2 t - 8t \sin t \cos t = 0$$

or $$7 + 2 \cos 2t - 2t \sin 2t = 0$$

Using "trial and error" or numerical methods, the smallest root is $t = 3.82 \text{ s}$ ◀

Note: The next root is $t = 4.38$ s.

PROBLEM 11.97

An airplane used to drop water on brushfires is flying horizontally in a straight line at 180 mi/h at an altitude of 300 ft. Determine the distance d at which the pilot should release the water so that it will hit the fire at B.

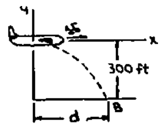
SOLUTION

First note $\qquad v_0 = 180 \text{ km/h} = 264 \text{ ft/s}$

Place origin of coordinates at Point A.

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (0)t - \frac{1}{2}gt^2$$



At B: $$-300 \text{ ft} = -\frac{1}{2}(32.2 \text{ ft/s}^2)t^2$$

or $$t_B = 4.31666 \text{ s}$$

Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At B: $$d = (264 \text{ ft/s})(4.31666 \text{ s})$$

or $$d = 1140 \text{ ft} \blacktriangleleft$$

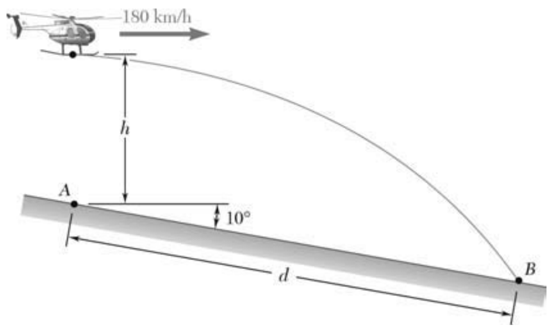
PROBLEM 11.98



A helicopter is flying with a constant horizontal velocity of 180 km/h and is directly above Point *A* when a loose part begins to fall. The part lands 6.5 s later at Point *B* on an inclined surface. Determine (*a*) the distance *d* between Points *A* and *B*, (*b*) the initial height *h*.

SOLUTION

Place origin of coordinates at Point *A*.

Horizontal motion: $(v_x)_0 = 180 \text{ km/h} = 50 \text{ m/s}$

$$x = x_0 + (v_x)_0 t = 0 + 50t \text{ m}$$

At Point *B* where $t_B = 6.5$ s, $x_B = (50)(6.5) = 325$ m

(*a*) Distance *AB*.

From geometry $d = \dfrac{325}{\cos 10°}$ $\qquad d = 330$ m ◀

Vertical motion: $y = y_0 + (v_y)_0 t - \dfrac{1}{2}gt^2$

At Point *B* $-x_B \tan 10° = h + 0 - \dfrac{1}{2}(9.81)(6.5)^2$

(*b*) Initial height. $\qquad h = 149.9$ m ◀

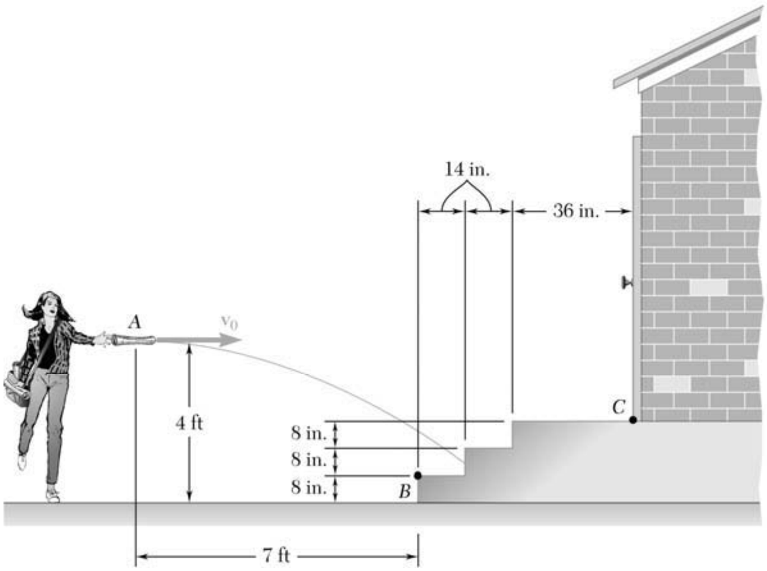
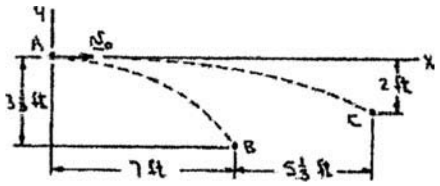
PROBLEM 11.100



While delivering newspapers, a girl throws a newspaper with a horizontal velocity $\mathbf{v}_0$. Determine the range of values of v_0 if the newspaper is to land between Points B and C.

SOLUTION



Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (0)t - \frac{1}{2}gt^2$$

Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = v_0 t$$

At B: y: $-3\frac{1}{3}\text{ ft} = -\frac{1}{2}(32.2\text{ ft/s}^2)t^2$

or $t_B = 0.455016\text{ s}$

Then x: $7\text{ ft} = (v_0)_B(0.455016\text{ s})$

or $(v_0)_B = 15.38\text{ ft/s}$

At C: y: $-2\text{ ft} = -\frac{1}{2}(32.2\text{ ft/s}^2)t^2$

or $t_C = 0.352454\text{ s}$

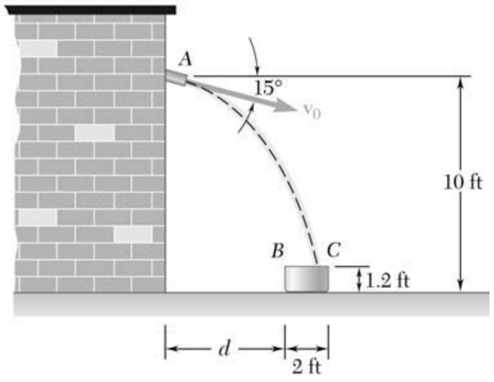
Then x: $12\frac{1}{3}\text{ ft} = (v_0)_C(0.352454\text{ s})$

or $(v_0)_C = 35.0\text{ ft/s}$

$15.38\text{ ft/s} < v_0 < 35.0\text{ ft/s}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.101

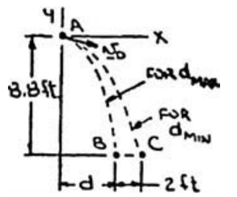


Water flows from a drain spout with an initial velocity of 2.5 ft/s at an angle of 15° with the horizontal. Determine the range of values of the distance d for which the water will enter the trough BC.

SOLUTION

First note $\quad (v_x)_0 = (2.5 \text{ ft/s}) \cos 15° = 2.4148 \text{ ft/s}$

$$(v_y)_0 = -(2.5 \text{ ft/s}) \sin 15° = -0.64705 \text{ ft/s}$$



Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2} g t^2$$

At the top of the trough

$$-8.8 \text{ ft} = (-0.64705 \text{ ft/s})t - \frac{1}{2}(32.2 \text{ ft/s}^2)t^2$$

or $\quad t_{BC} = 0.719491 \text{ s} \quad$ (the other root is negative)

Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

In time t_{BC} $\quad x_{BC} = (2.4148 \text{ ft/s})(0.719491 \text{ s}) = 1.737 \text{ ft}$

Thus, the trough must be placed so that

$$x_B < 1.737 \text{ ft or } x_C \geq 1.737 \text{ ft}$$

Since the trough is 2 ft wide, it then follows that $\quad 0 < d < 1.737$ ft ◀

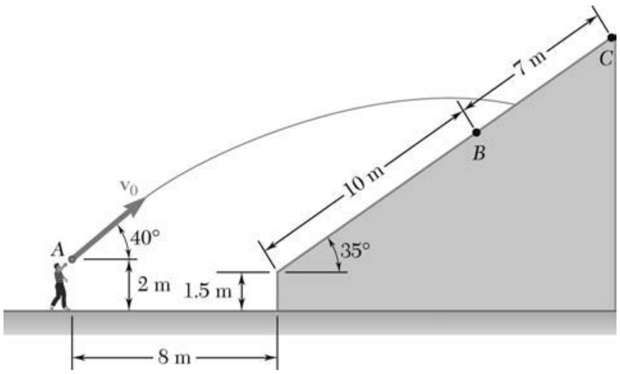
PROBLEM 11.106



At halftime of a football game souvenir balls are thrown to the spectators with a velocity $\mathbf{v}_0$. Determine the range of values of v_0 if the balls are to land between Points *B* and *C*.

SOLUTION

The motion is projectile motion. Place the origin of the *xy*-coordinate system at ground level just below Point *A*. The coordinates of Point *A* are $x_0 = 0,\ y_0 = 2\text{m}$. The components of initial velocity are $(v_x)_0 = v_0 \cos 40°$ m/s and $(v_y)_0 = v_0 \sin 40°$.

Horizontal motion:
$$x = x_0 + (v_x)_0 t = (v_0 \cos 40°)t \tag{1}$$

Vertical motion:
$$y = y_0 + (v_y)_0 t = \frac{1}{2}gt^2$$
$$= 2 + (v_0 \sin 40°) = -\frac{1}{2}(9.81)t^2 \tag{2}$$

From (1),
$$v_0 t = \frac{x}{\cos 40°} \tag{3}$$

Then
$$y = 2 + x \tan 40° - 4.905t^2$$
$$t^2 = \frac{2 + x\tan 40° - y}{4.905} \tag{4}$$

Point *B*:
$$x = 8 + 10\cos 35° = 16.1915 \text{ m}$$
$$y = 1.5 + 10\sin 35° = 7.2358 \text{ m}$$
$$v_0 t = \frac{16.1915}{\cos 40°} = 21.1365 \text{ m}$$
$$t^2 = \frac{2 + 16.1915\tan 40° - 7.2358}{4.905} \qquad t = 1.3048 \text{ s}$$
$$v_0 = \frac{21.1365}{1.3048} \qquad v_0 = 16.199 \text{ m/s}$$

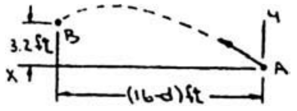
PROBLEM 11.107

A basketball player shoots when she is 16 ft from the backboard. Knowing that the ball has an initial velocity $\mathbf{v}_0$ at an angle of 30° with the horizontal, determine the value of v_0 when d is equal to (*a*) 9 in., (*b*) 17 in.

SOLUTION



First note $\quad (v_x)_0 = v_0 \cos 30° \qquad (v_y)_0 = v_0 \sin 30°$

Horizontal motion. (Uniform) $\quad x = 0 + (v_x)_0 t$

At *B*:

$$(16 - d) = (v_0 \cos 30°)t \quad \text{or} \quad t_B = \frac{16 - d}{v_0 \cos 30°}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2 \quad (g = 32.2 \text{ ft/s}^2)$$

At *B*:

$$3.2 = (v_0 \sin 30°)t_B - \frac{1}{2}gt_B^2$$

Substituting for t_B

$$3.2 = (v_0 \sin 30°)\left(\frac{16 - d}{v_0 \cos 30°}\right) - \frac{1}{2}g\left(\frac{16 - d}{v_0 \cos 30°}\right)^2$$

or

$$v_0^2 = \frac{2g(16 - d)^2}{3\left[\frac{1}{\sqrt{3}}(16 - d) - 3.2\right]}$$

(*a*) $\quad d = 9$ in.:

$$v_0^2 = \frac{2(32.2)\left(16 - \frac{9}{12}\right)^2}{3\left[\frac{1}{\sqrt{3}}\left(16 - \frac{9}{12}\right) - 3.2\right]}$$

$v_0 = 29.8$ ft/s ◀

(*b*) $\quad d = 17$ in.:

$$v_0^2 = \frac{2(32.2)\left(16 - \frac{17}{12}\right)^2}{3\left[\frac{1}{\sqrt{3}}\left(16 - \frac{17}{12}\right) - 3.2\right]}$$

$v_0 = 29.6$ ft/s ◀

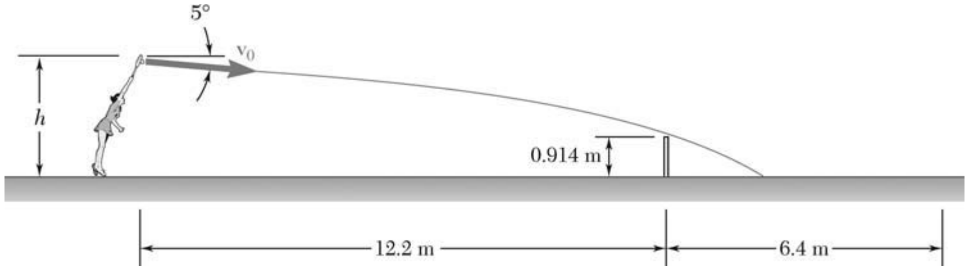
PROBLEM 11.108

A tennis player serves the ball at a height $h = 2.5$ m with an initial velocity of $\mathbf{v}_0$ at an angle of 5° with the horizontal. Determine the range for which of v_0 for which the ball will land in the service area which extends to 6.4 m beyond the net.



SOLUTION

The motion is projectile motion. Place the origin of the *xy*-coordinate system at ground level just below the point where the racket impacts the ball. The coordinates of this impact point are $x_0 = 0,\ y_0 = h = 2.5$ m. The components of initial velocity are $(v_x)_0 = v_0 \cos 5°$ and $(v_y)_0 = v_0 \sin 5°$.

Horizontal motion:
$$x = x_0 + (v_x)_0 t = (v_0 \cos 5°)t \qquad (1)$$

Vertical motion:
$$y = y_0 + (v_y)_0 t = \frac{1}{2} g t^2$$
$$= 2.5 - (v_0 \sin 5°)t = -\frac{1}{2}(9.81)t^2 \qquad (2)$$

From (1),
$$v_0 t = \frac{x}{\cos 5°} \qquad (3)$$

Then
$$y = 2.5 - x \tan 5° - 4.905 t^2$$
$$t^2 = \frac{2.5 - x \tan 5° - y}{4.905} \qquad (4)$$

At the minimum speed the ball just clears the net.

$$x = 12.2 \text{ m}, \quad y = 0.914 \text{ m}$$
$$v_0 t = \frac{12.2}{\cos 5°} = 12.2466 \text{ m}$$
$$t^2 = \frac{2.5 - 12.2 \tan 5° - 0.914}{4.905} \qquad t = 0.32517 \text{ s}$$
$$v_0 = \frac{12.2466}{0.32517} \qquad v_0 = 37.66 \text{ m/s}$$

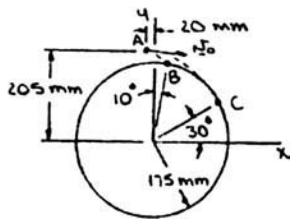
PROBLEM 11.109

The nozzle at A discharges cooling water with an initial velocity $\mathbf{v}_0$ at an angle of 6° with the horizontal onto a grinding wheel 350 mm in diameter. Determine the range of values of the initial velocity for which the water will land on the grinding wheel between Points B and C.

SOLUTION

First note



$$(v_x)_0 = v_0 \cos 6°$$
$$(v_y)_0 = -v_0 \sin 6°$$

Horizontal motion. (Uniform)

$$x = x_0 + (v_x)_0 t$$

Vertical motion. (Uniformly accelerated motion)

$$y = y_0 + (v_y)_0 t - \frac{1}{2} g t^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point B:
$$x = (0.175 \text{ m}) \sin 10°$$
$$y = (0.175 \text{ m}) \cos 10°$$

$$x: \quad 0.175 \sin 10° = -0.020 + (v_0 \cos 6°) t$$

or
$$t_B = \frac{0.050388}{v_0 \cos 6°}$$

$$y: \quad 0.175 \cos 10° = 0.205 + (-v_0 \sin 6°) t_B - \frac{1}{2} g t_B^2$$

Substituting for t_B

$$-0.032659 = (-v_0 \sin 6°)\left(\frac{0.050388}{v_0 \cos 6°}\right) - \frac{1}{2}(9.81)\left(\frac{0.050388}{v_0 \cos 6°}\right)^2$$

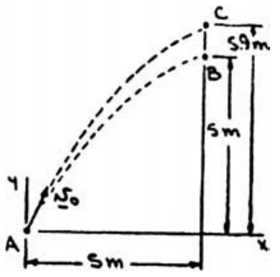
PROBLEM 11.110

While holding one of its ends, a worker lobs a coil of rope over the lowest limb of a tree. If he throws the rope with an initial velocity $\mathbf{v}_0$ at an angle of 65° with the horizontal, determine the range of values of v_0 for which the rope will go over only the lowest limb.

SOLUTION

First note

$$(v_x)_0 = v_0 \cos 65°$$
$$(v_y)_0 = v_0 \sin 65°$$



Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t$$

At either B or C, $x = 5$ m

$$s = (v_0 \cos 65°) t_{B,C}$$

or

$$t_{B,C} = \frac{5}{(v_0 \cos 65°)}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2} g t^2 \qquad (g = 9.81 \text{ m/s}^2)$$

At the tree limbs, $t = t_{B,C}$

$$y_{B,C} = (v_0 \sin 65°)\left(\frac{5}{v_0 \cos 65°}\right) - \frac{1}{2} g \left(\frac{5}{v_0 \cos 65°}\right)^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

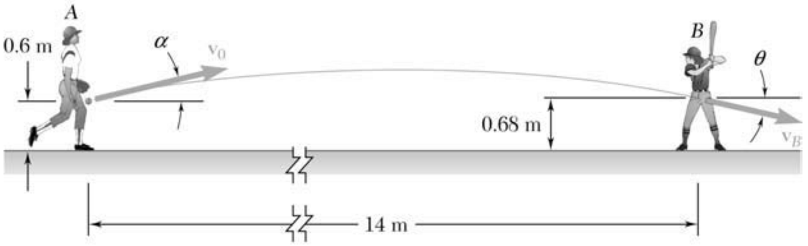
PROBLEM 11.111

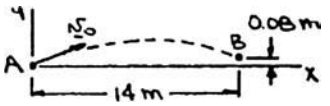
The pitcher in a softball game throws a ball with an initial velocity $\mathbf{v}_0$ of 72 km/h at an angle α with the horizontal. If the height of the ball at Point B is 0.68 m, determine (*a*) the angle α, (*b*) the angle θ that the velocity of the ball at Point B forms with the horizontal.



SOLUTION

First note

$$v_0 = 72 \text{ km/h} = 20 \text{ m/s}$$



and

$$(v_x)_0 = v_0 \cos\alpha = (20 \text{ m/s})\cos\alpha$$

$$(v_y)_0 = v_0 \sin\alpha = (20 \text{ m/s})\sin\alpha$$

(*a*) Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (20\cos\alpha)t$$

At Point B:

$$14 = (20\cos\alpha)t \quad \text{or} \quad t_B = \frac{7}{10\cos\alpha}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2 = (20\sin\alpha)t - \frac{1}{2}gt^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point B:

$$0.08 = (20\sin\alpha)t_B - \frac{1}{2}gt_B^2$$

Substituting for t_B

$$0.08 = (20\sin\alpha)\left(\frac{7}{10\cos\alpha}\right) - \frac{1}{2}g\left(\frac{7}{10\cos\alpha}\right)^2$$

or

$$8 = 1400\tan\alpha - \frac{1}{2}g\frac{49}{\cos^2\alpha}$$

Now

$$\frac{1}{\cos^2\alpha} = \sec^2\alpha = 1 + \tan^2\alpha$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Then $$8 = 1400 \tan\alpha - 24.5g(1 + \tan^2\alpha)$$

or $$240.345 \tan^2\alpha - 1400 \tan\alpha + 248.345 = 0$$

Solving $$\alpha = 10.3786° \quad \text{and} \quad \alpha = 79.949°$$

Rejecting the second root because it is not physically reasonable, we have

$$\alpha = 10.38° \blacktriangleleft$$

(*b*) We have $$v_x = (v_x)_0 = 20 \cos\alpha$$

and $$v_y = (v_y)_0 - gt = 20 \sin\alpha - gt$$

At Point *B*: $$(v_y)_B = 20 \sin\alpha - gt_B$$

$$= 20 \sin\alpha - \frac{7g}{10 \cos\alpha}$$

Noting that at Point *B*, $v_y < 0$, we have

$$\tan\theta = \frac{|(v_y)_B|}{v_x}$$

$$= \frac{\frac{7g}{10\cos\alpha} - 20 \sin\alpha}{20 \cos\alpha}$$

$$= \frac{\frac{7}{200}\frac{9.81}{\cos 10.3786°} - \sin 10.3786°}{\cos 10.3786°}$$

or $$\theta = 9.74° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.113 (Continued)

Now $$\frac{1}{\cos^2\alpha} = \sec^2\alpha = 1 + \tan^2\alpha$$

Then $$y_{\text{front}} = 16\tan\alpha - \frac{32g}{5929}(1+\tan^2\alpha)$$

or $$\tan^2\alpha - \frac{5929}{2g}\tan\alpha + \left(1 + \frac{5929}{32g}y_{\text{front}}\right) = 0$$

Then $$\tan\alpha = \frac{\frac{5929}{2g} \pm \left[\left(-\frac{5929}{2g}\right)^2 - 4\left(1+\frac{5929}{32g}y_{\text{front}}\right)\right]^{1/2}}{2}$$

or $$\tan\alpha = \frac{5929}{4\times 32.2} \pm \left[\left(-\frac{5929}{4\times 32.2}\right)^2 - \left(1 + \frac{5929}{32\times 32.2}y_{\text{front}}\right)\right]^{1/2}$$

or $$\tan\alpha = 46.0326 \pm [(46.0326)^2 - (1 + 5.7541\, y_{\text{front}})]^{1/2}$$

Now $0 < y_{\text{front}} < 4$ ft so that the positive root will yield values of $\alpha > 45°$ for all values of y_{front}. When the negative root is selected, α increases as y_{front} is increased. Therefore, for $\alpha_{\max}$, set

$$y_{\text{front}} = y_C = 4 \text{ ft}$$

Then $$\tan\alpha = 46.0326 - [(46.0326)^2 - (1 + 5.7541 + 4)]^{1/2}$$

or $$\alpha_{\max} = 14.6604°$$ $\alpha_{\max} = 14.66°$ ◀

(*b*) We had found $$t_{\text{enter}} = \frac{8}{77\cos\alpha}$$

$$= \frac{8}{77\cos 14.6604°}$$

or $t_{\text{enter}} = 0.1074$ s ◀

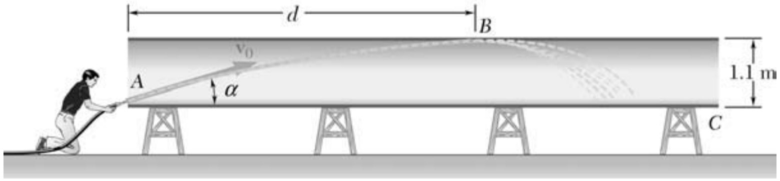
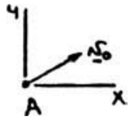
PROBLEM 11.114

A worker uses high-pressure water to clean the inside of a long drainpipe. If the water is discharged with an initial velocity $\mathbf{v}_0$ of 11.5 m/s, determine (*a*) the distance *d* to the farthest Point *B* on the top of the pipe that the worker can wash from his position at *A*, (*b*) the corresponding angle α.



SOLUTION



First note
$$(v_x)_0 = v_0 \cos\alpha = (11.5 \text{ m/s})\cos\alpha$$
$$(v_y)_0 = v_0 \sin\alpha = (11.5 \text{ m/s})\sin\alpha$$

By observation, d_{max} occurs when $y_{max} = 1.1$ m.

<u>Vertical motion</u>. (Uniformly accelerated motion)

$$v_y = (v_y)_0 - gt \qquad y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$
$$= (11.5\sin\alpha) - gt \qquad = (11.5\sin\alpha)t - \frac{1}{2}gt^2$$

When $\quad y = y_{max} \quad$ at $\quad B, \quad (v_y)_B = 0$

Then $\quad (v_y)_B = 0 = (11.5\sin\alpha) - gt$

or
$$t_B = \frac{11.5\sin\alpha}{g} \qquad (g = 9.81 \text{ m/s}^2)$$

and
$$y_B = (11.5\sin\alpha)t_B - \frac{1}{2}gt_B^2$$

Substituting for t_B and noting $y_B = 1.1$ m

$$1.1 = (11.5\sin\alpha)\left(\frac{11.5\sin\alpha}{g}\right) - \frac{1}{2}g\left(\frac{11.5\sin\alpha}{g}\right)^2$$
$$= \frac{1}{2g}(11.5)^2\sin^2\alpha$$

or
$$\sin^2\alpha = \frac{2.2\times 9.81}{11.5^2} \qquad \alpha = 23.8265°$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.114 (Continued)

(*a*) Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (11.5\cos\alpha)t$$

At Point *B*: $x = d_{\max}$ and $t = t_B$

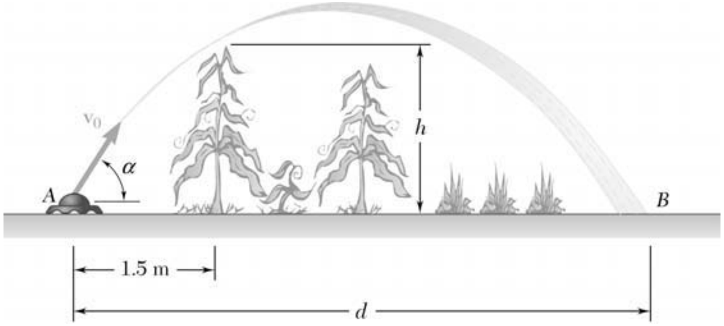
where $$t_B = \frac{11.5}{9.81}\sin 23.8265° = 0.47356\text{ s}$$

Then $$d_{\max} = (11.5)(\cos 23.8265°)(0.47356)$$

or $d_{\max} = 4.98\text{ m}$ ◀

(*b*) From above $\alpha = 23.8°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



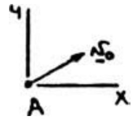
PROBLEM 11.115

An oscillating garden sprinkler which discharges water with an initial velocity $\mathbf{v}_0$ of 8 m/s is used to water a vegetable garden. Determine the distance d to the farthest Point B that will be watered and the corresponding angle α when (*a*) the vegetables are just beginning to grow, (*b*) the height h of the corn is 1.8 m.

SOLUTION

First note $\quad (v_x)_0 = v_0 \cos\alpha = (8 \text{ m/s}) \cos\alpha$

$$(v_y)_0 = v_0 \sin\alpha = (8 \text{ m/s}) \sin\alpha$$



Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (8\cos\alpha)t$$

At Point B: $\quad x = d: \quad d = (8\cos\alpha)t$

or $\quad t_B = \dfrac{d}{8\cos\alpha}$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$

$$= (8\sin\alpha)t - \frac{1}{2}gt^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point B: $\quad 0 = (8\sin\alpha)t_B - \frac{1}{2}gt_B^2$

Simplifying and substituting for t_B

$$0 = 8\sin\alpha - \frac{1}{2}g\left(\frac{d}{8\cos\alpha}\right)$$

or $\quad d = \dfrac{64}{g}\sin 2\alpha \qquad (1)$

(*a*) When $h = 0,$ the water can follow any physically possible trajectory. It then follows from Eq. (1) that d is maximum when $2\alpha = 90°$

or $\quad \alpha = 45°$ ◀

Then $\quad d = \dfrac{64}{9.81}\sin(2\times 45°)$

or $\quad d_{\max} = 6.52 \text{ m}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) Based on Eq. (1) and the results of Part *a*, it can be concluded that *d* increases in value as α increases in value from 0 to 45° and then *d* decreases as α is further increased. Thus, d_{max} occurs for the value of α closest to 45° and for which the water just passes over the first row of corn plants. At this row, $x_{\text{com}} = 1.5$ m

so that

$$t_{\text{corn}} = \frac{1.5}{8\cos\alpha}$$

Also, with $y_{\text{corn}} = h,$ we have

$$h = (8\sin\alpha)t_{\text{corn}} - \frac{1}{2}gt_{\text{corn}}^2$$

Substituting for t_{corn} and noting $h = 1.8$ m,

$$1.8 = (8\sin\alpha)\left(\frac{1.5}{8\cos\alpha}\right) - \frac{1}{2}g\left(\frac{1.5}{8\cos\alpha}\right)^2$$

or

$$1.8 = 1.5\tan\alpha - \frac{2.25g}{128\cos^2\alpha}$$

Now

$$\frac{1}{\cos^2\alpha} = \sec^2\alpha = 1 + \tan^2\alpha$$

Then

$$1.8 = 1.5\tan\alpha - \frac{2.25(9.81)}{128}(1 + \tan^2\alpha)$$

or

$$0.172441\tan^2\alpha - 1.5\tan\alpha + 1.972441 = 0$$

Solving

$$\alpha = 58.229° \quad \text{and} \quad \alpha = 81.965°$$

From the above discussion, it follows that $d = d_{\text{max}}$ when

$$\alpha = 58.2° \blacktriangleleft$$

Finally, using Eq. (1)

$$d = \frac{64}{9.81}\sin(2 \times 58.229°)$$

or

$$d_{\text{max}} = 5.84 \text{ m} \blacktriangleleft$$

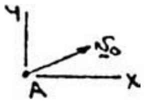
PROBLEM 11.116*

A mountain climber plans to jump from A to B over a crevasse. Determine the smallest value of the climber's initial velocity $\mathbf{v}_0$ and the corresponding value of angle α so that he lands at B.

SOLUTION

First note
$$(v_x)_0 = v_0 \cos\alpha$$
$$(v_y)_0 = v_0 \sin\alpha$$



Horizontal motion. (Uniform)

$$x = 0 + (v_x)_0 t = (v_0 \cos\alpha)t$$

At Point B:
$$1.8 = (v_0 \cos\alpha)t$$

or
$$t_B = \frac{1.8}{v_0 \cos\alpha}$$

Vertical motion. (Uniformly accelerated motion)

$$y = 0 + (v_y)_0 t - \frac{1}{2}gt^2$$
$$= (v_0 \sin\alpha)t - \frac{1}{2}gt^2 \quad (g = 9.81 \text{ m/s}^2)$$

At Point B:
$$-1.4 = (v_0 \sin\alpha)t_B - \frac{1}{2}gt_B^2$$

Substituting for t_B

$$-1.4 = (v_0 \sin\alpha)\left(\frac{1.8}{v_0 \cos\alpha}\right) - \frac{1}{2}g\left(\frac{1.8}{v_0 \cos\alpha}\right)^2$$

or
$$v_0^2 = \frac{1.62g}{\cos^2\alpha(1.8\tan\alpha + 1.4)}$$
$$= \frac{1.62g}{0.9\sin 2\alpha + 1.4\cos^2\alpha}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.116* (Continued)

Now minimize v_0^2 with respect to α.

We have
$$\frac{dv_0^2}{d\alpha} = 1.62g\frac{-(1.8\cos 2\alpha - 2.8\cos\alpha\sin\alpha)}{(0.9\sin 2\alpha + 1.4\cos^2\alpha)^2} = 0$$

or
$$1.8\cos 2\alpha - 1.4\sin 2\alpha = 0$$

or
$$\tan 2\alpha = \frac{18}{14}$$

or
$$\alpha = 26.0625° \quad \text{and} \quad \alpha = 206.06°$$

Rejecting the second value because it is not physically possible, we have

$$\alpha = 26.1° \blacktriangleleft$$

Finally,
$$v_0^2 = \frac{1.62 \times 9.81}{\cos^2 26.0625°(1.8\tan 26.0625° + 1.4)}$$

or
$$(v_0)_{\min} = 2.94 \text{ m/s} \blacktriangleleft$$

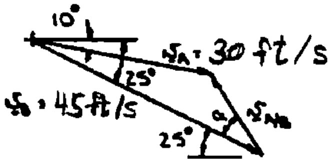
PROBLEM 11.117

The velocities of skiers *A* and *B* are as shown. Determine the velocity of *A* with respect to *B*.

SOLUTION

We have $\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$

The graphical representation of this equation is then as shown.



Then $\mathbf{v}_{A/B}^2 = 30^2 + 45^2 - 2(30)(45)\cos 15°$

or $v_{A/B} = 17.80450 \text{ ft/s}$

and $\dfrac{30}{\sin\alpha} = \dfrac{17.80450}{\sin 15°}$

or $\alpha = 25.8554°$

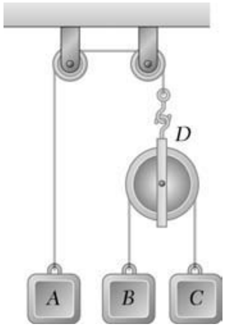
$\alpha + 25° = 50.8554°$

$\mathbf{v}_{A/B} = 17.8 \text{ ft/s} \measuredangle\ 50.9°$ ◀

Alternative solution.

$$\begin{aligned}\mathbf{v}_{A/B} &= \mathbf{v}_A - \mathbf{v}_B \\ &= 30\cos 10°\,\mathbf{i} - 30\sin 10°\mathbf{j} - (45\cos 25°\mathbf{i} - 45°\sin 25°\mathbf{j}) \\ &= 11.2396\mathbf{i} + 13.8084\,\mathbf{j} \\ &= 5.05 \text{ m/s} = 17.8 \text{ ft/s} \measuredangle\ 50.9°\end{aligned}$$

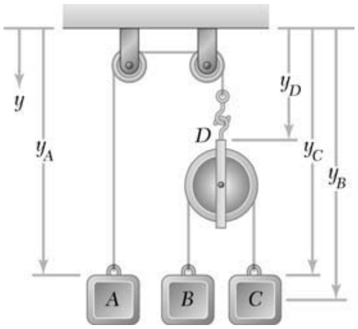
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.118

The three blocks shown move with constant velocities. Find the velocity of each block, knowing that the relative velocity of A with respect to C is 300 mm/s upward and that the relative velocity of B with respect to A is 200 mm/s downward.

SOLUTION



From the diagram

Cable 1: $\quad y_A + y_D = \text{constant}$

Then $\quad v_A + v_D = 0 \quad (1)$

Cable 2: $\quad (y_B - y_D) + (y_C - y_D) = \text{constant}$

Then $\quad v_B + v_C - 2v_D = 0 \quad (2)$

Combining Eqs. (1) and (2) to eliminate v_D,

$$2v_A + v_B + v_C = 0 \quad (3)$$

Now $\quad v_{A/C} = v_A - v_C = -300 \text{ mm/s} \quad (4)$

and $\quad v_{B/A} = v_B - v_A = 200 \text{ mm/s} \quad (5)$

Then $\quad (3) + (4) - (5) \Rightarrow$

$$(2v_A + v_B + v_C) + (v_A - v_C) - (v_B - v_A) = (-300) - (200)$$

or $\quad \mathbf{v}_A = 125 \text{ mm/s} \uparrow \blacktriangleleft$

and using Eq. (5) $\quad v_B - (-125) = 200$

or $\quad \mathbf{v}_B = 75 \text{ mm/s} \downarrow \blacktriangleleft$

Eq. (4) $\quad -125 - v_C = -300$

or $\quad \mathbf{v}_C = 175 \text{ mm/s} \downarrow \blacktriangleleft$

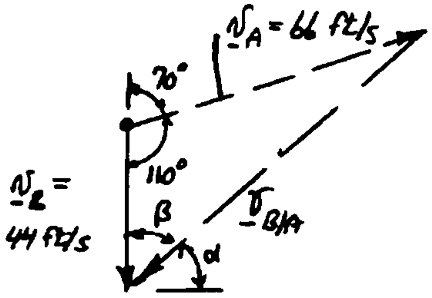
PROBLEM 11.119

Three seconds after automobile B passes through the intersection shown, automobile A passes through the same intersection. Knowing that the speed of each automobile is constant, determine (a) the relative velocity of B with respect to A, (b) the change in position of B with respect to A during a 4-s interval, (c) the distance between the two automobiles 2 s after A has passed through the intersection.

SOLUTION



$$v_A = 45 \text{ mi/h} = 66 \text{ ft/s}$$
$$v_B = 30 \text{ mi/h} = 44 \text{ ft/s}$$

Law of cosines

$$v_{B/A}^2 = 66^2 + 44^2 - 2(66)(44)\cos 110°$$
$$v_{B/A} = 90.99 \text{ ft/s}$$

$$v_B = v_A + v_{B/A}$$

Law of sines

$$\frac{\sin\beta}{66} = \frac{\sin 110°}{90.99} \qquad \beta = 42.97°$$
$$\alpha = 90° - \beta = 90° - 42.97° = 47.03°$$

(a) Relative velocity: $\mathbf{v}_{B/A} = 91.0 \text{ ft/s} \angle 47.0°$ ◀

(b) Change in position for $\Delta t = 4$ s.

$$\Delta r_{B/A} = v_{B/A}\Delta t = (91.0 \text{ ft/s})(4 \text{ s})$$

$\mathbf{r}_{B/A} = 364 \text{ ft} \angle 47.0°$ ◀

(c) Distance between autos 2 seconds after auto A has passed intersection.

Auto A travels for 2 s.

$$v_A = 66 \text{ ft/s} \angle 20°$$
$$r_A = v_A t = (66 \text{ ft/s})(2 \text{ s}) = 132 \text{ ft}$$
$$\mathbf{r}_A = 132 \text{ ft} \angle 20°$$

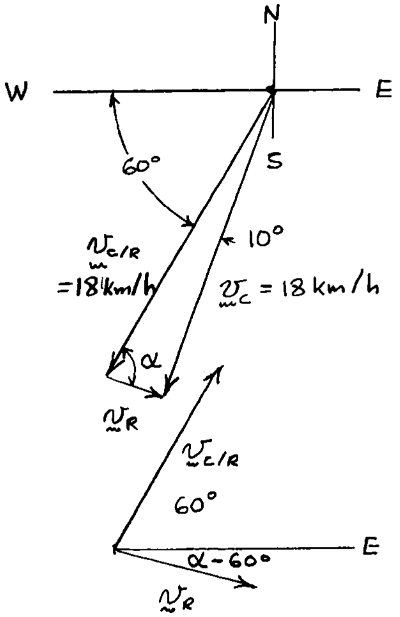
PROBLEM 11.120

Shore-based radar indicates that a ferry leaves its slip with a velocity $\mathbf{v} = 18$ km/h ↙ 70°, while instruments aboard the ferry indicate a speed of 18.4 km/h and a heading of 30° west of south relative to the river. Determine the velocity of the river.

SOLUTION



We have $\qquad \mathbf{v}_F = \mathbf{v}_R + \mathbf{v}_{F/R} \quad$ or $\quad \mathbf{v}_F = \mathbf{v}_{F/R} + \mathbf{v}_R$

The graphical representation of the second equation is then as shown.

We have $\qquad v_R^2 = 18^2 + 18.4^2 - 2(18)(18.4)\cos 10°$

or $\qquad v_R = 3.1974$ km/h

and $\qquad \dfrac{18}{\sin\alpha} = \dfrac{3.1974}{\sin 10°}$

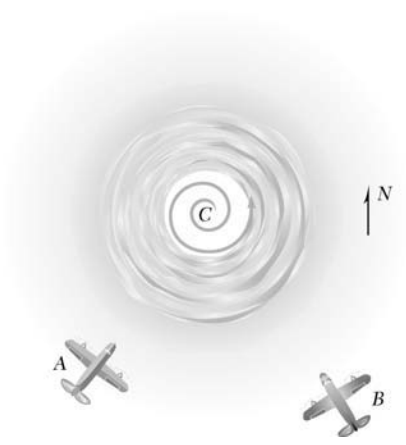
or $\qquad \alpha = 77.84°$

Noting that

$$\mathbf{v}_R = 3.20 \text{ km/h} \searrow 17.8° \blacktriangleleft$$

Alternatively one could use vector algebra.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.121

Airplanes A and B are flying at the same altitude and are tracking the eye of hurricane C. The relative velocity of C with respect to A is $\mathbf{v}_{C/A} = 350$ km/h $\measuredangle$ 75°, and the relative velocity of C with respect to B is $\mathbf{v}_{C/B} = 400$ km/h $\measuredangle$ 40°. Determine (*a*) the relative velocity of B with respect to A, (*b*) the velocity of A if ground-based radar indicates that the hurricane is moving at a speed of 30 km/h due north, (*c*) the change in position of C with respect to B during a 15-min interval.

SOLUTION

(*a*) We have $\mathbf{v}_C = \mathbf{v}_A + \mathbf{v}_{C/A}$

and $\mathbf{v}_C = \mathbf{v}_B + \mathbf{v}_{C/B}$

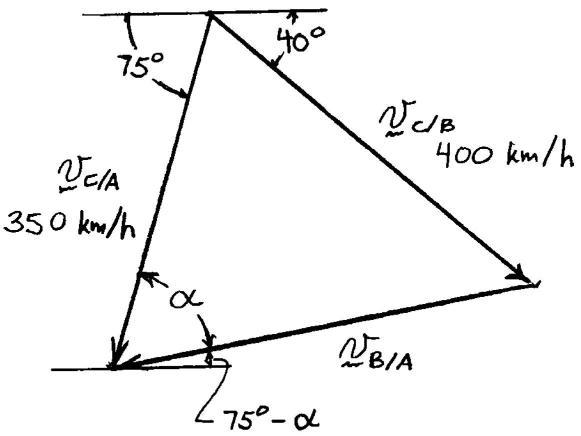
Then $\mathbf{v}_A + \mathbf{v}_{C/A} = \mathbf{v}_B + \mathbf{v}_{C/B}$

or $\mathbf{v}_B - \mathbf{v}_A = \mathbf{v}_{C/A} - \mathbf{v}_{C/B}$

Now $\mathbf{v}_B - \mathbf{v}_A = \mathbf{v}_{B/A}$

so that $\mathbf{v}_{B/A} = \mathbf{v}_{C/A} - \mathbf{v}_{C/B}$

or $\mathbf{v}_{C/A} = \mathbf{v}_{C/B} + \mathbf{v}_{B/A}$



The graphical representation of the last equation is then as shown.

We have $v_{B/A}^2 = 350^2 + 400^2 - 2(350)(400)\cos 65°$

or $v_{B/A} = 405.175$ km/h

and $\dfrac{400}{\sin\alpha} = \dfrac{405.175}{\sin 65°}$

or $\alpha = 63.474°$

$75° - \alpha = 11.526°$

$\mathbf{v}_{B/A} = 405$ km/h $\measuredangle$ 11.53° ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.122

Pin P moves at a constant speed of 150 mm/s in a counterclockwise sense along a circular slot which has been milled in the slider block A shown. Knowing that the block moves downward at a constant speed 100 mm/s determine the velocity of pin P when (a) $\theta = 30°$, (b) $\theta = 120°$.

SOLUTION

$$\mathbf{v}_P = \mathbf{v}_A + \mathbf{v}_{P/A}$$

$$\mathbf{v}_P = 100 \text{ ms } (-\mathbf{j}) + 150(\cos\theta\mathbf{i} + \sin\theta\mathbf{j})\text{mm/s}$$

(a) For $\theta = 30°$

$$\mathbf{v}_P = -100 \text{ mm/s } (\mathbf{j}) + 150(-\cos(30°)\mathbf{i} + \sin(30°)\mathbf{j})\text{mm/s}$$

$$\mathbf{v}_P = (-75\mathbf{i} + 29.9038\mathbf{j})\text{mm/s}$$

$$\mathbf{v}_P = 80.7 \text{ mm/s} \measuredangle 21.7° \blacktriangleleft$$

(b) For $\theta = 120°$

$$\mathbf{v}_P = -100 \text{ mm/s } (\mathbf{j}) + 150(-\cos(120°)\mathbf{i} + \sin(120°)\mathbf{j})\text{mm/s}$$

$$\mathbf{v}_P = (-129.9038\mathbf{i} + -175\mathbf{j}) \text{ mm/s}$$

$$\mathbf{v}_P = 218 \text{ mm/s} \measuredangle 53.4° \blacktriangleleft$$

Alternative Solution

(a) For $\theta = 30°$, $v_{P/A} = 7.5 \text{ in./s} \measuredangle 30°$

$$v_P = v_A + v_{P/A}$$

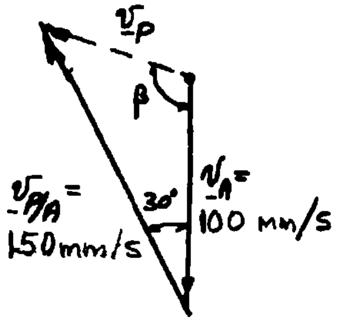
Law of cosines

$$v_P^2 = (150)^2 + (100)^2 - 2(100)(150)\cos 30°$$

$$v_P = 80.7418 \text{ mm/s}$$

Law of sines

$$\frac{\sin\beta}{150} = \frac{\sin 30°}{80.7418} \qquad \beta = 111.7°$$



$$v_P = 80.7 \text{ mm/s} \measuredangle 21.7° \blacktriangleleft$$

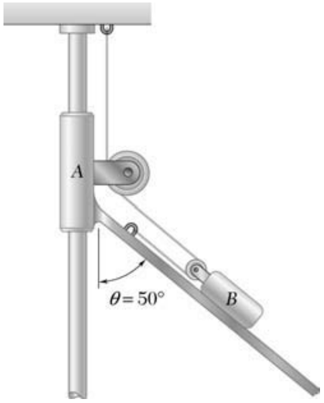
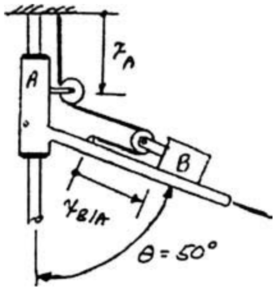
PROBLEM 11.123



Knowing that at the instant shown assembly A has a velocity of 9 in./s and an acceleration of 15 in./s^2 both directed downward, determine (*a*) the velocity of block B, (*b*) the acceleration of block B.

SOLUTION



Length of cable = constant

$$L = x_A + 2x_{B/A} = \text{constant}$$

$$v_A + 2v_{B/A} = 0 \qquad (1)$$

$$a_A + 2a_{B/A} = 0 \qquad (2)$$

Data:

$$\mathbf{a}_A = 15 \text{ in./s}^2 \downarrow$$

$$\mathbf{v}_A = 9 \text{ in./s} \downarrow$$

Eqs. (1) and (2)

$$a_A = -2a_{B/A} \qquad v_A = -2v_{B/A}$$

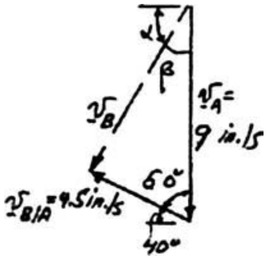
$$15 = -2a_{B/A} \qquad 9 = -2v_{B/A}$$

$$a_{B/A} = -7.5 \text{ in./s}^2 \qquad v_{B/A} = -4.5 \text{ in./s}$$

$$\mathbf{a}_{B/A} = 7.5 \text{ in./s}^2 \searrow 40° \qquad \mathbf{v}_{B/A} = -4.5 \text{ in./s} \searrow 40°$$

(*a*) Velocity of B.

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$$



Law of cosines:

$$v_B^2 = (9)^2 + (4.5)^2 - 2(9)(4.5)\cos 50°$$

$$v_B = 7.013 \text{ in./s}$$

Law of sines:

$$\frac{\sin\beta}{4.5} = \frac{\sin 50°}{7.013} \qquad \beta = 29.44°$$

$$\alpha = 90° - \beta = 90° - 29.44° = 60.56°$$

$$\mathbf{v}_B = 7.01 \text{ in./s} \nearrow 60.6° \blacktriangleleft$$

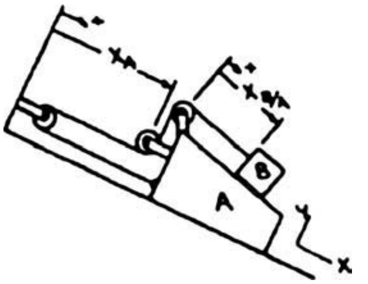
PROBLEM 11.124

Knowing that at the instant shown block A has a velocity of 8 in./s and an acceleration of 6 in./s^2 both directed down the incline, determine (*a*) the velocity of block B, (*b*) the acceleration of block B.

SOLUTION

From the diagram $\quad 2x_A + x_{B/A} = \text{constant}$



Then $\quad 2v_A + v_{B/A} = 0$

or $\quad |v_{B/A}| = 16 \text{ in./s}$

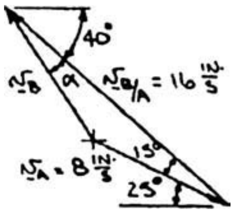
and $\quad 2a_A + a_{B/A} = 0$

or $\quad |a_{B/A}| = 12 \text{ in./s}^2$

Note that $\mathbf{v}_{B/A}$ and $\mathbf{a}_{B/A}$ must be parallel to the top surface of block A.

(*a*) We have $\quad \mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

The graphical representation of this equation is then as shown. Note that because A is moving downward, B must be moving upward relative to A.



We have $\quad v_B^2 = 8^2 + 16^2 - 2(8)(16)\cos 15°$

or $\quad v_B = 8.5278 \text{ in./s}$

and $\quad \dfrac{8}{\sin\alpha} = \dfrac{8.5278}{\sin 15°}$

or $\quad \alpha = 14.05°$

$\mathbf{v}_B = 8.53 \text{ in./s} \searrow 54.1°$ ◀

(*b*) The same technique that was used to determine $\mathbf{v}_B$ can be used to determine $\mathbf{a}_B$. An alternative method is as follows.

We have
$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$
$$= (6\mathbf{i}) + 12(-\cos 15°\mathbf{i} + \sin 15°\mathbf{j})^*$$
$$= -(5.5911 \text{ in./s}^2)\mathbf{i} + (3.1058 \text{ in./s}^2)\mathbf{j}$$

or $\quad \mathbf{a}_B = 6.40 \text{ in./s}^2 \searrow 54.1°$ ◀

* Note the orientation of the coordinate axes on the sketch of the system.

PROBLEM 11.125

A boat is moving to the right with a constant deceleration of 0.3 m/s^2 when a boy standing on the deck D throws a ball with an initial velocity relative to the deck which is vertical. The ball rises to a maximum height of 8 m above the release point and the boy must step forward a distance d to catch it at the same height as the release point. Determine (a) the distance d, (b) the relative velocity of the ball with respect to the deck when the ball is caught.

SOLUTION

Horizontal motion of the ball: $v_x = (v_x)_0, \quad x_{\text{ball}} = (v_x)_0 t$

Vertical motion of the ball: $v_y = (v_y)_0 - gt$

$$y_B = (v_y)_0 t - \frac{1}{2}gt^2, \quad (v_y)^2 - (v_y)_0^2 = -2gy$$

At maximum height, $v_y = 0$ and $y = y_{\text{max}}$

$$(v_y)^2 = 2gy_{\text{max}} = (2)(9.81)(8) = 156.96 \text{ m}^2/\text{s}^2$$

$$(v_y)_0 = 12.528 \text{ m/s}$$

At time of catch, $y = 0 = 12.528 - \frac{1}{2}(9.81)t^2$

or $t_{\text{catch}} = 2.554 \text{ s}$ and $v_y = 12.528 \text{ m/s}\downarrow$

Motion of the deck: $v_x = (v_x)_0 + a_D t, \quad x_{\text{deck}} = (v_x)_0 t + \frac{1}{2}a_D t^2$

Motion of the ball relative to the deck:

$$(v_{B/D})_x = (v_x)_0 - [(v_x)_0 + a_D t] = -a_D t$$

$$x_{B/D} = (v_x)_0 t - \left[(v_x)_0 t + \frac{1}{2}a_D t^2\right] = -\frac{1}{2}a_D t^2$$

$$(v_{B/D})_y = (v_y)_0 - gt, \quad y_{B/D} = y_B$$

(a) At time of catch, $d = x_{D/B} = -\frac{1}{2}(-0.3)(2.554)^2$ $\qquad d = 0.979 \text{ m}$ ◀

(b) $(v_{B/D})_x = -(-0.3)(2.554) = +0.766 \text{ m/s}$ or $0.766 \text{ m/s} \rightarrow$

$(v_{B/D})_y = 12.528 \text{ m/s}\downarrow$ $\qquad \mathbf{v}_{B/D} = 12.55 \text{ m/s} \searrow 86.5°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 11.126

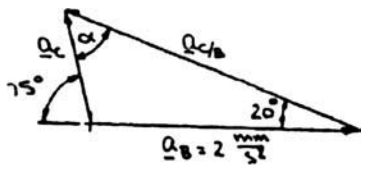
The assembly of rod A and wedge B starts from rest and moves to the right with a constant acceleration of 2 mm/s^2. Determine (a) the acceleration of wedge C, (b) the velocity of wedge C when $t = 10$ s.

SOLUTION

(a) We have

$$\mathbf{a}_C = \mathbf{a}_B + \mathbf{a}_{C/B}$$

The graphical representation of this equation is then as shown.



First note

$$\alpha = 180° - (20° + 105°)$$
$$= 55°$$

Then

$$\frac{a_C}{\sin 20°} = \frac{2}{\sin 55°}$$

$$a_C = 0.83506 \text{ mm/s}^2$$

$$\mathbf{a}_C = 0.835 \text{ mm/s}^2 \nwarrow 75° \blacktriangleleft$$

(b) For uniformly accelerated motion

$$v_C = 0 + a_C t$$

At $t = 10$ s:

$$v_C = (0.83506 \text{ mm/s}^2)(10 \text{ s})$$
$$= 8.3506 \text{ mm/s}$$

or

$$\mathbf{v}_C = 8.35 \text{ mm/s} \nwarrow 75° \blacktriangleleft$$

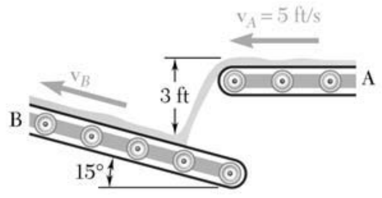
PROBLEM 11.127



Determine the required velocity of the belt B if the relative velocity with which the sand hits belt B is to be (*a*) vertical, (*b*) as small as possible.

SOLUTION

A grain of sand will undergo projectile motion.

$$v_{s_x} = v_{s_{x_0}} = \text{constant} = -5 \text{ ft/s}$$

<u>*y*-direction</u>. $$v_{s_y} = \sqrt{2gh} = \sqrt{(2)(32.2 \text{ ft/s}^2)(3 \text{ ft})} = 13.90 \text{ ft/s} \downarrow$$

<u>Relative velocity</u>. $$\mathbf{v}_{S/B} = \mathbf{v}_S - \mathbf{v}_B \qquad (1)$$

(*a*) If $v_{S/B}$ is vertical,

$$-v_{S/B}\mathbf{j} = -5\mathbf{i} - 13.9\mathbf{j} - (-v_B \cos 15°\mathbf{i} + v_B \sin 15°\mathbf{j})$$
$$= -5\mathbf{i} - 13.9\mathbf{j} + v_B \cos 15°\mathbf{i} - v_B \sin 15°\mathbf{j}$$

<u>Equate components</u>. $\mathbf{i}$: $0 = -5 + v_B \cos 15°$ $\qquad v_B = \dfrac{5}{\cos 15°} = 5.176$ ft/s

$$\mathbf{v}_B = 5.18 \text{ ft/s} \measuredangle 15° ◀$$

(*b*) $v_{S/C}$ is as small as possible, so make $v_{S/B} \perp$ to v_B into (1).

$$-v_{S/B} \sin 15°\mathbf{i} - v_{S/B} \cos 15°\mathbf{j} = -5\mathbf{i} - 13.9\mathbf{j} + v_B \cos 15°\mathbf{i} - v_B \sin 15°\mathbf{j}$$

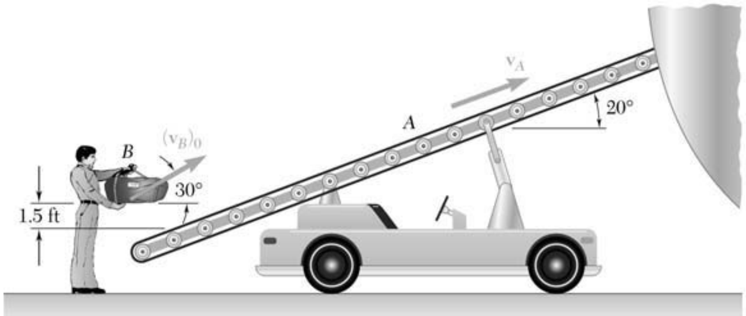
Equate components and transpose terms.

$$(\sin 15°)\, v_{S/B} + (\cos 15°)\, v_B = 5$$
$$(\cos 15°)\, v_{S/B} - (\sin 15°)\, v_B = 13.90$$

Solving, $\qquad v_{S/B} = 14.72$ ft/s $\qquad v_B = 1.232$ ft/s

$$\mathbf{v}_B = 1.232 \text{ ft/s} \measuredangle 15° ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

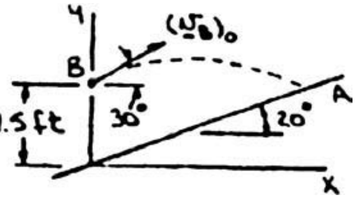


PROBLEM 11.128

Conveyor belt A, which forms a 20° angle with the horizontal, moves at a constant speed of 4 ft/s and is used to load an airplane. Knowing that a worker tosses duffel bag B with an initial velocity of 2.5 ft/s at an angle of 30° with the horizontal, determine the velocity of the bag relative to the belt as it lands on the belt.

SOLUTION

First determine the velocity of the bag as it lands on the belt. Now



$$[(v_B)_x]_0 = (v_B)_0 \cos 30^\circ$$
$$= (2.5 \text{ ft/s}) \cos 30^\circ$$
$$[(v_B)_y]_0 = (v_B)_0 \sin 30^\circ$$
$$= (2.5 \text{ ft/s}) \sin 30^\circ$$

Horizontal motion. (Uniform)

$$x = 0 + [(v_B)_x]_0\, t \qquad (v_B)_x = [(v_B)_x]_0$$
$$= (2.5 \cos 30^\circ)\, t \qquad = 2.5 \cos 30^\circ$$

Vertical motion. (Uniformly accelerated motion)

$$y = y_0 + [(v_B)_y]_0\, t - \frac{1}{2} g t^2 \qquad (v_B)_y = [(v_B)_y]_0 - gt$$
$$= 1.5 + (2.5 \sin 30^\circ)\, t - \frac{1}{2} g t^2 \qquad = 2.5 \sin 30^\circ - gt$$

The equation of the line collinear with the top surface of the belt is

$$y = x \tan 20^\circ$$

Thus, when the bag reaches the belt

$$1.5 + (2.5 \sin 30^\circ)\, t - \frac{1}{2} g t^2 = [(2.5 \cos 30^\circ)\, t] \tan 20^\circ$$

or $$\frac{1}{2}(32.2) t^2 + 2.5(\cos 30^\circ \tan 20^\circ - \sin 30^\circ)\, t - 1.5 = 0$$

or $$16.1 t^2 - 0.46198 t - 1.5 = 0$$

Solving $$t = 0.31992 \text{ s} \quad \text{and} \quad t = -0.29122 \text{ s} \quad \text{(Reject)}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.128 (Continued)

The velocity $\mathbf{v}_B$ of the bag as it lands on the belt is then

$$\mathbf{v}_B = (2.5\cos 30°)\mathbf{i} + [2.5\sin 30° - 32.2(0.319\,92)]\mathbf{j}$$
$$= (2.1651 \text{ ft/s})\mathbf{i} - (9.0514 \text{ ft/s})\mathbf{j}$$

Finally $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

or $\mathbf{v}_{B/A} = (2.1651\mathbf{i} - 9.0514\mathbf{j}) - 4(\cos 20°\mathbf{i} + \sin 20°\mathbf{j})$
$$= -(1.59367 \text{ ft/s})\mathbf{i} - (10.4195 \text{ ft/s})\mathbf{j}$$

or $\mathbf{v}_{B/A} = 10.54 \text{ ft/s} \measuredangle 81.3°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.129

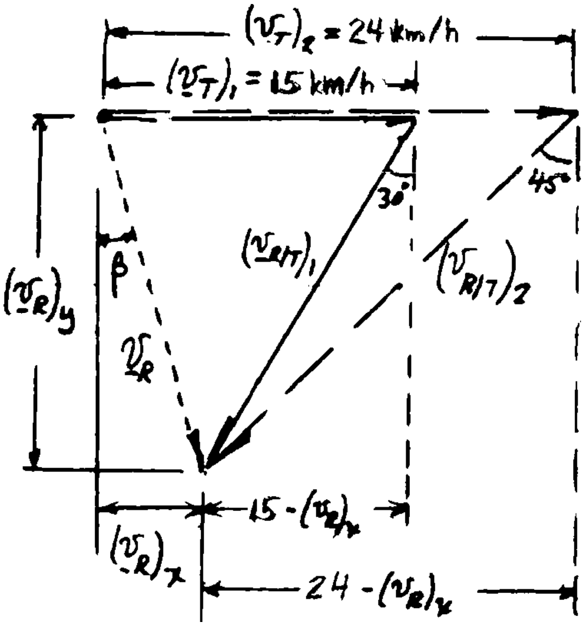
During a rainstorm the paths of the raindrops appear to form an angle of 30° with the vertical and to be directed to the left when observed from a side window of a train moving at a speed of 15 km/h. A short time later, after the speed of the train has increased to 24 km/h, the angle between the vertical and the paths of the drops appears to be 45°. If the train were stopped, at what angle and with what velocity would the drops be observed to fall?

SOLUTION

$$v_{\text{rain}} = v_{\text{train}} + v_{\text{rain/train}}$$

Case ①: $v_T = 15 \text{ km/h} \longrightarrow; \quad v_{R/T} \swarrow 30°$

Case ②: $v_T = 24 \text{ km/h} \longrightarrow; \quad v_{R/T} \swarrow 45°$



Case ①: $(v_R)_y \tan 30 = 15 - (v_R)_x$ (1)

Case ②: $(v_R)_y \tan 45° = 24 - (v_R)_x$ (2)

Substract (1) from (2) $(v_R)_y (\tan 45° - \tan 30°) = 9$

$$(v_R)_y = 21.294 \text{ km/h}$$

Eq. (2): $21.294 \tan 45° = 25 - (v_R)_x$

$$(v_R)_x = 2.706 \text{ km/h}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.129 (Continued)

$$\tan\beta = \frac{3.706}{21.294}$$
$$\beta = 7.24°$$
$$v_R = \frac{21.294}{\cos 7.24°} = 21.47 \text{ km/h} = 5.96 \text{ m/s}$$

$v_R = 5.96 \text{ m/s} \ \measuredangle\ 82.8°$ ◀

Alternate solution

Alternate, vector equation $\mathbf{v}_R = \mathbf{v}_T + \mathbf{v}_{R/T}$

For first case, $\mathbf{v}_R = 15\mathbf{i} + v_{R/T-1}(-\sin 30°\mathbf{i} - \cos 30°\mathbf{j})$

For second case, $\mathbf{v}_R = 24\mathbf{i} + v_{R/T-2}(-\sin 45°\mathbf{i} - \cos 45°\mathbf{j})$

Set equal

$$15\mathbf{i} + v_{R/T-1}(-\sin 30°\mathbf{i} - \cos 30°\mathbf{j}) = 24\mathbf{i} + v_{R/T-2}(-\sin 45°\mathbf{i} - \cos 45°\mathbf{j})$$

Separate into components:

i: $$15 - v_{R/T-1}\sin 30° = 24 - v_{R/T-2}\sin 45°$$

$$-v_{R/T-1}\sin 30° + v_{R/T-2}\sin 45° = 9 \qquad (3)$$

j: $$-v_{R/T-1}\cos 30° = -v_{R/T-2}\cos 45°$$

$$v_{R/T-1}\cos 30° + v_{R/T-2}\cos 45° = 0 \qquad (4)$$

Solving Eqs. (3) and (4) simultaneously,

$$v_{R/T-1} = 24.5885 \text{ km/h} \qquad v_{R/T-2} = 30.1146 \text{ km/h}$$

Substitute $\mathbf{v}_{R/T-2}$ back into equation for $\mathbf{v}_R$.

$$\mathbf{v}_R = 24\mathbf{i} + 30.1146(-\sin 45°\mathbf{i} - \cos 45°\mathbf{j})$$

$$\mathbf{v}_R = 2.71\mathbf{i} - 21.29\mathbf{j} \qquad \mathbf{v}_R = 21.4654 \text{ km/hr} = 5.96 \text{ m/s}$$

$$\theta = \tan^{-1}\left(\frac{-21.29}{2.71}\right) = -82.7585° \qquad \mathbf{v}_R = 5.96 \text{ m/s} \ \measuredangle\ 82.8°$$ ◀

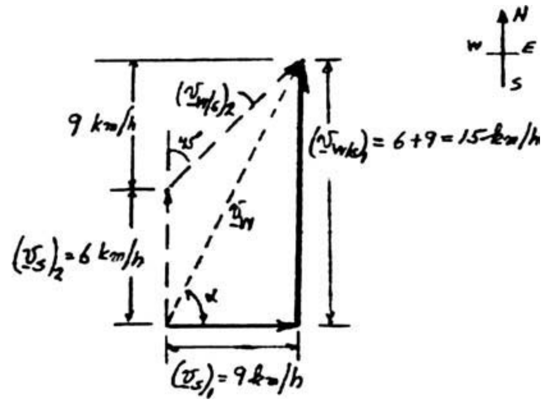
PROBLEM 11.130

As observed from a ship moving due east at 9 km/h, the wind appears to blow from the south. After the ship has changed course and speed, and as it is moving north at 6 km/h, the wind appears to blow from the southwest. Assuming that the wind velocity is constant during the period of observation, determine the magnitude and direction of the true wind velocity.

SOLUTION

$$\mathbf{v}_{\text{wind}} = \mathbf{v}_{\text{ship}} + \mathbf{v}_{\text{wind/ship}}$$

$$\mathbf{v}_w = \mathbf{v}_s + \mathbf{v}_{w/s}$$



Case ①

$$\mathbf{v}_s = 9 \text{ km/h} \rightarrow; \quad \mathbf{v}_{w/s} \uparrow$$

Case ②

$$\mathbf{v}_s = 6 \text{ km/h} \uparrow; \quad \mathbf{v}_{w/s} \nearrow$$

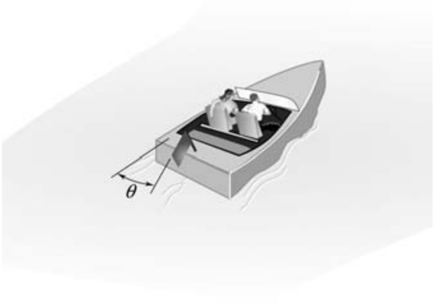
$$\tan \alpha = \frac{15}{9} = 1.6667$$

$$\alpha = 59.0°$$

$$v_w = \sqrt{9^2 + 15^2} = 17.49 \text{ km/h}$$

$$\mathbf{v}_w = 17.49 \text{ km/h} \measuredangle 59.0° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



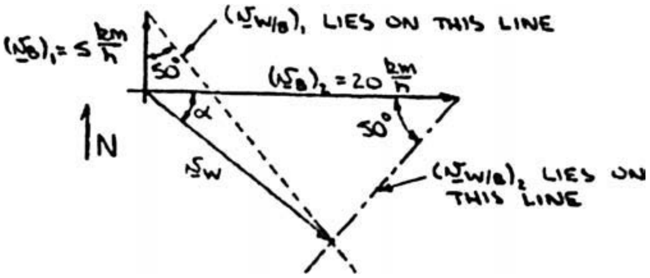
PROBLEM 11.131

When a small boat travels north at 5 km/h, a flag mounted on its stern forms an angle $\theta = 50°$ with the centerline of the boat as shown. A short time later, when the boat travels east at 20 km/h, angle θ is again 50°. Determine the speed and the direction of the wind.

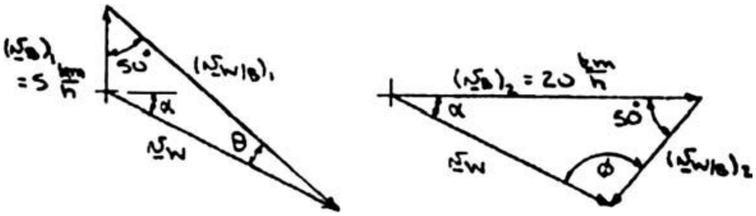
SOLUTION

We have $$\mathbf{v}_W = \mathbf{v}_B + \mathbf{v}_{W/B}$$

Using this equation, the two cases are then graphically represented as shown.



With $\mathbf{v}_W$ now defined, the above diagram is redrawn for the two cases for clarity.



Noting that

$$\theta = 180° - (50° + 90° + \alpha) = 40° - \alpha \qquad \phi = 180° - (50° + \alpha) = 130° - \alpha$$

We have $$\frac{v_W}{\sin 50°} = \frac{5}{\sin(40° - \alpha)} \qquad \frac{v_W}{\sin 50°} = \frac{20}{\sin(130° - \alpha)}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.131 (Continued)

Therefore
$$\frac{5}{\sin(40^\circ-\alpha)}=\frac{20}{\sin(130^\circ-\alpha)}$$

or
$$\sin 130^\circ \cos\alpha-\cos 130^\circ \sin\alpha=4(\sin 40^\circ \cos\alpha-\cos 40^\circ \sin\alpha)$$

or
$$\tan\alpha=\frac{\sin 130^\circ-4\sin 40^\circ}{\cos 130^\circ-4\cos 40^\circ}$$

or
$$\alpha=25.964^\circ$$

Then
$$v_W=\frac{5\sin 50^\circ}{\sin(40^\circ-25.964^\circ)}=15.79 \text{ km/h}$$

$$\mathbf{v}_W=15.79 \text{ km/h} \searrow 26.0^\circ \blacktriangleleft$$

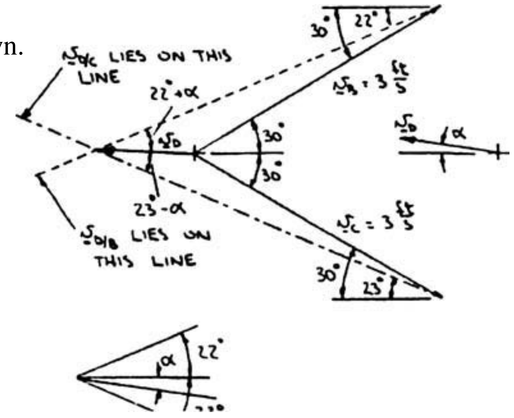
PROBLEM 11.132

As part of a department store display, a model train D runs on a slight incline between the store's up and down escalators. When the train and shoppers pass Point A, the train appears to a shopper on the up escalator B to move downward at an angle of 22° with the horizontal, and to a shopper on the down escalator C to move upward at an angle of 23° with the horizontal and to travel to the left. Knowing that the speed of the escalators is 3 ft/s, determine the speed and the direction of the train.

SOLUTION

We have
$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B}$$
$$\mathbf{v}_D = \mathbf{v}_C + \mathbf{v}_{D/C}$$

The graphical representations of these equations are then as shown.



Then $\quad \dfrac{v_D}{\sin 8°} = \dfrac{3}{\sin(22° + \alpha)} \qquad \dfrac{v_D}{\sin 7°} = \dfrac{3}{\sin(23° - \alpha)}$

Equating the expressions for $\dfrac{v_D}{3}$

$$\frac{\sin 8°}{\sin(22° + \alpha)} = \frac{\sin 7°}{\sin(23° - \alpha)}$$

or $\quad \sin 8°(\sin 23° \cos\alpha - \cos 23° \sin\alpha)$
$$= \sin 7°(\sin 22° \cos\alpha + \cos 22° \sin\alpha)$$

or
$$\tan\alpha = \frac{\sin 8° \sin 23° - \sin 7° \sin 22°}{\sin 8° \cos 23° + \sin 7° \cos 22°}$$

or
$$\alpha = 2.0728°$$

Then
$$v_D = \frac{3 \sin 8°}{\sin(22° + 2.0728°)} = 1.024 \text{ ft/s}$$

$$\mathbf{v}_D = 1.024 \text{ ft/s} \measuredangle 2.07° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 11.132 (Continued)

<u>Alternate solution using components</u>.

$$\mathbf{v}_B = (3\text{ ft/s}) \measuredangle 30° = (2.5981\text{ ft/s})\mathbf{i} + (1.5\text{ ft/s})\mathbf{j}$$

$$\mathbf{v}_C = (3\text{ ft/s}) \searrow 30° = (2.5981\text{ ft/s})\mathbf{i} - (1.5\text{ ft/s})\mathbf{j}$$

$$\mathbf{v}_{D/B} = u_1 \swarrow 22° = -(u_1 \cos 22°)\mathbf{i} - (u_1 \sin 22°)\mathbf{j}$$

$$\mathbf{v}_{D/C} = u_2 \nwarrow 23° = -(u_2 \cos 23°)\mathbf{i} + (u_2 \sin 23°)\mathbf{j}$$

$$\mathbf{v}_D = v_D \nwarrow \alpha = -(v_D \cos \alpha)\mathbf{i} + (v_D \sin \alpha)\mathbf{j}$$

$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B} = \mathbf{v}_C + \mathbf{v}_{D/C}$$

$$2.5981\mathbf{i} + 1.5\mathbf{j} - (u_1 \cos 22°)\mathbf{i} - (u_1 \sin 22°)\mathbf{j} = 2.5981\mathbf{i} - 1.5\mathbf{j} - (u_2 \cos 23°)\mathbf{i} + (u_2 \sin 23°)\mathbf{j}$$

Separate into components, transpose, and change signs.

$$u_1 \cos 22° - u_2 \cos 23° = 0$$

$$u_1 \sin 22° + u_1 \sin 23° = 3$$

Solving for u_1 and u_2, $\quad u_1 = 3.9054\text{ ft/s} \qquad u_2 = 3.9337\text{ ft/s}$

$$\mathbf{v}_D = 2.5981\mathbf{i} + 1.5\mathbf{j} - (3.9054 \cos 22°)\mathbf{i} - (3.9054 \sin 22°)\mathbf{j}$$
$$= -(1.0229\text{ ft/s})\mathbf{i} + (0.0370\text{ ft/s})\mathbf{j}$$

or

$$\mathbf{v}_D = 2.5981\mathbf{i} - 1.5\mathbf{j} - (3.9337 \cos 23°)\mathbf{i} + (3.9337 \sin 23°)\mathbf{j}$$
$$= -(1.0229\text{ ft/s})\mathbf{i} + (0.0370\text{ ft/s})\mathbf{j}$$

$$\mathbf{v}_D = 1.024\text{ ft/s} \nwarrow 2.07° \blacktriangleleft$$

PROBLEM 11.CQ8

The Ferris wheel is rotating with a constant angular velocity ω. What is the direction of the acceleration of Point A?

(*a*) →

(*b*) ↑

(*c*) ↓

(*d*) ←

(*e*) The acceleration is zero.

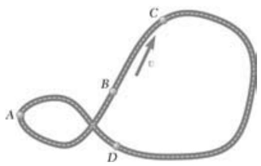
SOLUTION

The tangential acceleration is zero since the speed is constant, so there will only be normal acceleration pointed upwards.

Answer: (*b*) ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.CQ9



A racecar travels around the track shown at a constant speed. At which point will the racecar have the largest acceleration?

(*a*) A

(*b*) B

(*c*) C

(*d*) The acceleration will be zero at all the points.

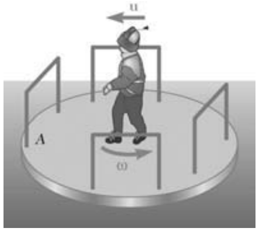
SOLUTION

The tangential acceleration is zero since the speed is constant, so there will only be normal acceleration. The normal acceleration will be maximum where the radius of curvature is a minimum, that is at Point A.

Answer: (*a*) ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.CQ10



A child walks across merry-go-round *A* with a constant speed *u* relative to *A*. The merry-go-round undergoes fixed axis rotation about its center with a constant angular velocity ω counterclockwise. When the child is at the center of *A*, as shown, what is the direction of his acceleration when viewed from above.

(*a*) →

(*b*) ←

(*c*) ↑

(*d*) ↓

(*e*) The acceleration is zero.

SOLUTION

Polar coordinates are most natural for this problem, that is,

$$\vec{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta \qquad (1)$$

From the information given, we know $\ddot{r} = 0,\ \ddot{\theta} = 0,\ r = 0,\ \dot{\theta} = \omega,\ \dot{r} = -u.$ When we substitute these values into (1), we will only have a term in the $-\theta$ direction.

Answer: (*d*) ◀

PROBLEM 11.135

A bull-roarer is a piece of wood that produces a roaring sound when attached to the end of a string and whirled around in a circle. Determine the magnitude of the normal acceleration of a bull-roarer when it is spun in a circle of radius 0.9 m at a speed of 20 m/s.

SOLUTION

$$a_n = \frac{v^2}{\rho} = \frac{(20 \text{ m/s})^2}{0.9 \text{ m}} = 444.4 \text{ m/s}^2$$

$$a_n = 444 \text{ m/s}^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

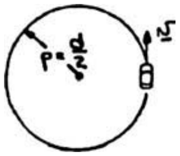
PROBLEM 11.136

To test its performance, an automobile is driven around a circular test track of diameter d. Determine (a) the value of d if when the speed of the automobile is 45 mi/h, the normal component of the acceleration is $11\ \text{ft/s}^2$, (b) the speed of the automobile if $d = 600\ \text{ft}$ and the normal component of the acceleration is measured to be 0.6 g.

SOLUTION

(a) First note $\quad v = 45\ \text{mi/h} = 66\ \text{ft/s}$

Now $\quad a_n = \dfrac{v^2}{\rho}$



$$\rho = \frac{(66\ \text{ft/s})^2}{11\ \text{ft/s}^2} = 396\ \text{ft}$$

$$d = 2\rho$$

$d = 792\ \text{ft}$ ◀

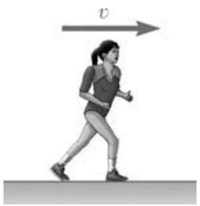
(b) We have $\quad a_n = \dfrac{v^2}{\rho}$

Then $\quad v^2 = (0.6 \times 32.2\ \text{ft/s}^2)\left(\dfrac{1}{2} \times 600\ \text{ft}\right)$

$$v = 76.131\ \text{ft/s}$$

$v = 51.9\ \text{mi/h}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

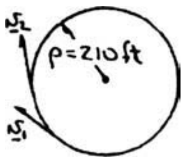


PROBLEM 11.137

An outdoor track is 420 ft in diameter. A runner increases her speed at a constant rate from 14 to 24 ft/s over a distance of 95 ft. Determine the magnitude of the total acceleration of the runner 2 s after she begins to increase her speed.

SOLUTION

We have uniformly accelerated motion



$$v_2^2 = v_1^2 + 2a_t \Delta s_{12}$$

Substituting $(24 \text{ ft/s})^2 = (14 \text{ ft/s})^2 + 2a_t(95 \text{ ft})$

or $a_t = 2 \text{ ft/s}^2$

Also $v = v_1 + a_t t$

At $t = 2$ s: $v = 14 \text{ ft/s} + (2 \text{ ft/s}^2)(2 \text{ s}) = 18 \text{ ft/s}$

Now $a_n = \dfrac{v^2}{\rho}$

At $t = 2$ s: $a_n = \dfrac{(18 \text{ ft/s})^2}{210 \text{ ft}} = 1.54286 \text{ ft/s}^2$

Finally $a^2 = a_t^2 + a_n^2$

At $t = 2$ s: $a^2 = 2^2 + 1.54286^2$

or $a = 2.53 \text{ ft/s}^2$ ◀

PROBLEM 11.138

A robot arm moves so that P travels in a circle about Point B, which is not moving. Knowing that P starts from rest, and its speed increases at a constant rate of 10 mm/s^2, determine (a) the magnitude of the acceleration when $t = 4$ s, (b) the time for the magnitude of the acceleration to be 80 mm/s^2.

SOLUTION

Tangential acceleration: $a_t = 10 \text{ mm/s}^2$

Speed: $v = a_t t$

Normal acceleration: $a_n = \dfrac{v^2}{\rho} = \dfrac{a_t^2 t^2}{\rho}$

where $\rho = 0.8 \text{ m} = 800 \text{ mm}$

(a) When $t = 4$ s $\quad v = (10)(4) = 40 \text{ mm/s}$

$$a_n = \frac{(40)^2}{800} = 2 \text{ mm/s}^2$$

Acceleration: $a = \sqrt{a_t^2 + a_n^2} = \sqrt{(10)^2 + (2)^2}$

$$a = 10.20 \text{ mm/s}^2 \blacktriangleleft$$

(b) Time when $a = 80 \text{ mm/s}^2$

$$a^2 = a_n^2 + a_t^2$$

$$(80)^2 = \left[\frac{(10)^2 t^2}{800}\right]^2 + 10^2 \qquad t^4 = 403200 \text{ s}^4$$

$$t = 25.2 \text{ s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.139

A monorail train starts from rest on a curve of radius 400 m and accelerates at the constant rate a_t. If the maximum total acceleration of the train must not exceed 1.5 m/s^2, determine (*a*) the shortest distance in which the train can reach a speed of 72 km/h, (*b*) the corresponding constant rate of acceleration a_t.

SOLUTION

When $v = 72 \text{ km/h} = 20 \text{ m/s}$ and $\rho = 400 \text{ m}$,

$$a_n = \frac{v^2}{\rho} = \frac{(20)^2}{400} = 1.000 \text{ m/s}^2$$

But $$a = \sqrt{a_n^2 + a_t^2}$$

$$a_t = \sqrt{a^2 - a_n^2} = \sqrt{(1.5)^2 - (1.000)^2} = \pm 1.11803 \text{ m/s}^2$$

Since the train is accelerating, reject the negative value.

(*a*) Distance to reach the speed.

$$v_0 = 0$$

Let $$x_0 = 0$$

$$v_1^2 = v_0^2 + 2a_t(x_1 - x_0) = 2a_t x_1$$

$$x_1 = \frac{v_1^2}{2a_t} = \frac{(20)^2}{(2)(1.11803)}$$

$x_1 = 178.9 \text{ m}$ ◀

(*b*) Corresponding tangential acceleration.

$a_t = 1.118 \text{ m/s}^2$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 11.140

A motorist starts from rest at Point A on a circular entrance ramp when $t = 0$, increases the speed of her automobile at a constant rate and enters the highway at Point B. Knowing that her speed continues to increase at the same rate until it reaches 100 km/h at Point C, determine (a) the speed at Point B, (b) the magnitude of the total acceleration when $t = 20$ s.

SOLUTION

Speeds: $v_0 = 0 \qquad v_1 = 100 \text{ km/h} = 27.78 \text{ m/s}$

Distance: $$s = \frac{\pi}{2}(150) + 100 = 335.6 \text{ m}$$

Tangential component of acceleration: $v_1^2 = v_0^2 + 2a_t s$

$$a_t = \frac{v_1^2 - v_0^2}{2s} = \frac{(27.78)^2 - 0}{(2)(335.6)} = 1.1495 \text{ m/s}^2$$

At Point B, $\quad v_B^2 = v_0^2 + 2a_t s_B \quad$ where $\quad s_B = \frac{\pi}{2}(150) = 235.6 \text{ m}$

$$v_B^2 = 0 + (2)(1.1495)(235.6) = 541.69 \text{ m}^2/\text{s}^2$$

$$v_B = 23.27 \text{ m/s} \qquad v_B = 83.8 \text{ km/h} \blacktriangleleft$$

(a) At $t = 20$ s, $\quad v = v_0 + a_t t = 0 + (1.1495)(20) = 22.99 \text{ m/s}$

Since $v < v_B$, the car is still on the curve. $\quad \rho = 150 \text{ m}$

Normal component of acceleration: $$a_n = \frac{v^2}{\rho} = \frac{(22.99)^2}{150} = 3.524 \text{ m/s}^2$$

(b) Magnitude of total acceleration: $$|a| = \sqrt{a_t^2 + a_n^2} = \sqrt{(1.1495)^2 + (3.524)^2} \qquad |a| = 3.71 \text{ m/s}^2 \blacktriangleleft$$

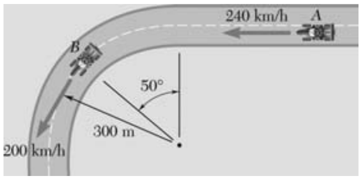
PROBLEM 11.141



Racecar A is traveling on a straight portion of the track while racecar B is traveling on a circular portion of the track. At the instant shown, the speed of A is increasing at the rate of 10 m/s^2, and the speed of B is decreasing at the rate of 6 m/s^2. For the position shown, determine (a) the velocity of B relative to A, (b) the acceleration of B relative to A.

SOLUTION

Speeds:

$$v_A = 240 \text{ km/h} = 66.67 \text{ m/s}$$
$$v_B = 200 \text{ km/h} = 55.56 \text{ m/s}$$

Velocities:

$$\mathbf{v}_A = 66.67 \text{ m/s} \leftarrow$$
$$\mathbf{v}_B = 55.56 \text{ m/s} \swarrow 50°$$

(a) Relative velocity:

$$\mathbf{v}_{B/A} = \mathbf{v}_B - \mathbf{v}_A$$
$$\mathbf{v}_{B/A} = (55.56\cos 50°) \leftarrow + 55.56\sin 50° \downarrow + 66.67 \rightarrow$$
$$= 30.96 \rightarrow + 42.56 \downarrow$$
$$= 52.63 \text{ m/s} \searrow 53.96°$$

$$\mathbf{v}_{B/A} = 189.5 \text{ km/h} \searrow 54.0° \blacktriangleleft$$

Tangential accelerations:

$$(\mathbf{a}_A)_t = 10 \text{ m/s}^2 \leftarrow$$
$$(\mathbf{a}_B)_t = 6 \text{ m/s}^2 \nearrow 50°$$

Normal accelerations:

$$a_n = \frac{v^2}{\rho}$$

Car A: $(\rho = \infty)$ $\quad (\mathbf{a}_A)_n = 0$

Car B: $(\rho = 300 \text{ m})$

$$(\mathbf{a}_B)_n = \frac{(55.56)^2}{300} = 10.288 \qquad (\mathbf{a}_B)_n = 10.288 \text{ m/s}^2 \searrow 40°$$

(b) Acceleration of B relative to A:

$$\mathbf{a}_{B/A} = \mathbf{a}_B - \mathbf{a}_A$$
$$\mathbf{a}_{B/A} = (\mathbf{a}_B)_t + (\mathbf{a}_B)_n - (\mathbf{a}_A)_t - (\mathbf{a}_A)_n$$
$$= 6 \nearrow 50° + 10.288 \searrow 40° + 10 \rightarrow + 0$$
$$= (6\cos 50° + 10.288\cos 40° + 10) \rightarrow$$
$$+ (6\sin 50° - 10.288\sin 40°) \uparrow$$
$$= 21.738 \rightarrow + 2.017 \downarrow \qquad \mathbf{a}_{B/A} = 21.8 \text{ m/s}^2 \searrow 5.3° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.142

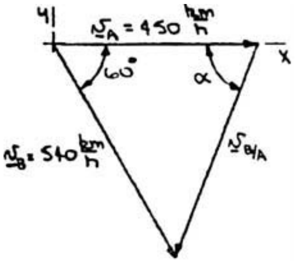
At a given instant in an airplane race, airplane A is flying horizontally in a straight line, and its speed is being increased at the rate of 8 m/s^2. Airplane B is flying at the same altitude as airplane A and, as it rounds a pylon, is following a circular path of 300-m radius. Knowing that at the given instant the speed of B is being decreased at the rate of 3 m/s^2, determine, for the positions shown, (a) the velocity of B relative to A, (b) the acceleration of B relative to A.

SOLUTION

First note $\qquad v_A = 450\text{ km/h} \quad v_B = 540\text{ km/h} = 150\text{ m/s}$

(a) We have $\qquad \mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

The graphical representation of this equation is then as shown.



We have

$$v_{B/A}^2 = 450^2 + 540^2 - 2(450)(540)\cos 60^\circ$$

$$v_{B/A} = 501.10\text{ km/h}$$

and

$$\frac{540}{\sin\alpha} = \frac{501.10}{\sin 60^\circ}$$

$$\alpha = 68.9^\circ$$

$$\mathbf{v}_{B/A} = 501\text{ km/h} \swarrow 68.9^\circ \blacktriangleleft$$

(b) First note $\qquad \mathbf{a}_A = 8\text{ m/s}^2 \longrightarrow \qquad (\mathbf{a}_B)_t = 3\text{ m/s}^2 \nwarrow 60^\circ$

Now

$$(a_B)_n = \frac{v_B^2}{\rho_B} = \frac{(150\text{ m/s})^2}{300\text{ m}}$$

$$(\mathbf{a}_B)_n = 75\text{ m/s}^2 \swarrow 30^\circ$$

Then

$$\begin{aligned}\mathbf{a}_B &= (\mathbf{a}_B)_t + (\mathbf{a}_B)_n \\ &= 3(-\cos 60^\circ\,\mathbf{i} + \sin 60^\circ\mathbf{j}) + 75(-\cos 30^\circ\,\mathbf{i} - \sin 30^\circ\mathbf{j}) \\ &= -(66.452\text{ m/s}^2)\mathbf{i} - (34.902\text{ m/s}^2)\mathbf{j}\end{aligned}$$

Finally

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

$$\begin{aligned}\mathbf{a}_{B/A} &= (-66.452\mathbf{i} - 34.902\mathbf{j}) - (8\mathbf{i}) \\ &= -(74.452\text{ m/s}^2)\mathbf{i} - (34.902\text{ m/s}^2)\mathbf{j}\end{aligned}$$

$$\mathbf{a}_{B/A} = 82.2\text{ m/s}^2 \swarrow 25.1^\circ \blacktriangleleft$$

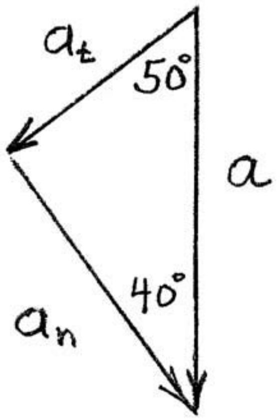
PROBLEM 11.143

From a photograph of a homeowner using a snowblower, it is determined that the radius of curvature of the trajectory of the snow was 30 ft as the snow left the discharge chute at A. Determine (a) the discharge velocity $\mathbf{v}_A$ of the snow, (b) the radius of curvature of the trajectory at its maximum height.

SOLUTION



(a) The acceleration vector is 32.2 ft/s↓.

At Point A, tangential and normal components of **a** are as shown in the sketch.

$$a_n = a\cos 40° = 32.2\cos 40° = 24.67 \text{ ft/s}^2$$

$$v_A^2 = \rho_A (a_A)_n = (30)(24.67) = 740.0 \text{ ft}^2/\text{s}^2$$

$$\mathbf{v}_A = 27.2 \text{ ft/s} \measuredangle 40° \blacktriangleleft$$

$$v_x = 27.20\cos 40° = 20.84 \text{ ft/s}$$

(b) At maximum height, $v = v_x = 20.84$ ft/s

$$a_n = g = 32.2 \text{ ft/s}^2,$$

$$\rho = \frac{v^2}{a_n} = \frac{(20.84)^2}{32.2} \qquad \rho = 13.48 \text{ ft} \blacktriangleleft$$

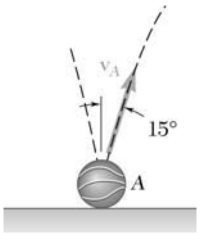
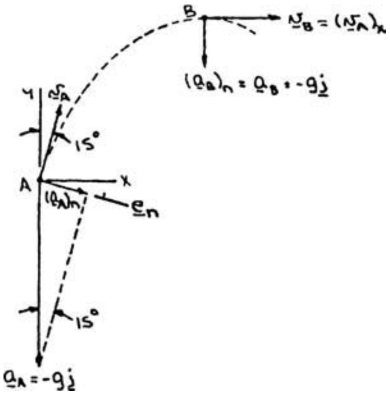
PROBLEM 11.144



A basketball is bounced on the ground at Point A and rebounds with a velocity $\mathbf{v}_A$ of magnitude 2.5 m/s as shown. Determine the radius of curvature of the trajectory described by the ball (*a*) at Point A, (*b*) at the highest point of the trajectory.

SOLUTION



(*a*) We have $(a_A)_n = \dfrac{v_A^2}{\rho_A}$

or $$\rho_A = \frac{(2.5 \text{ m/s})^2}{(9.81 \text{ m/s}^2)\sin 15^\circ}$$

or $\rho_A = 2.46 \text{ m}$ ◀

(*b*) We have $(a_B)_n = \dfrac{v_B^2}{\rho_B}$

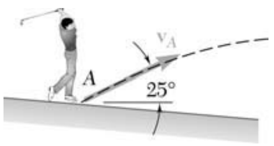
where Point B is the highest point of the trajectory, so that

$$v_B = (v_A)_x = v_A \sin 15^\circ$$

Then $$\rho_B = \frac{[(2.5 \text{ m/s})\sin 15^\circ]^2}{9.81 \text{ m/s}^2} = 0.0427 \text{ m}$$

or $\rho_B = 42.7 \text{ mm}$ ◀

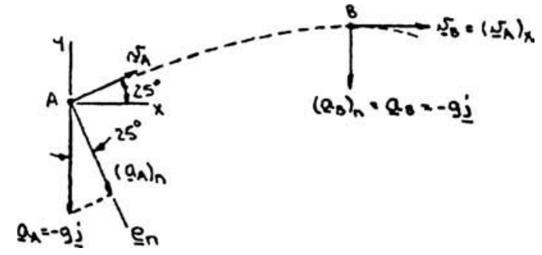
If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.145

A golfer hits a golf ball from Point *A* with an initial velocity of 50 m/s at an angle of 25° with the horizontal. Determine the radius of curvature of the trajectory described by the ball (*a*) at Point *A*, (*b*) at the highest point of the trajectory.

SOLUTION



(*a*) We have $(a_A)_n = \dfrac{v_A^2}{\rho_A}$

or $$\rho_A = \frac{(50\text{ m/s})^2}{(9.81\text{ m/s}^2)\cos 25°}$$

or $\rho_A = 281\text{ m}$ ◀

(*b*) We have $(a_B)_n = \dfrac{v_B^2}{\rho_B}$

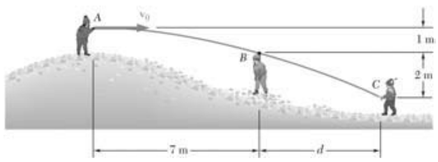
where Point *B* is the highest point of the trajectory, so that

$$v_B = (v_A)_x = v_A \cos 25°$$

Then $$\rho_B = \frac{[(50\text{ m/s})\cos 25°]^2}{9.81\text{ m/s}^2}$$

or $\rho_B = 209\text{ m}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.146

Three children are throwing snowballs at each other. Child *A* throws a snowball with a horizontal velocity $\mathbf{v}_0$. If the snowball just passes over the head of child *B* and hits child C, determine the radius of curvature of the trajectory described by the snowball (*a*) at Point *B*, (*b*) at Point *C*.

SOLUTION

The motion is projectile motion. Place the origin at Point *A*.

Horizontal motion: $\mathbf{v}_x = v_0 \qquad x = v_0 t$

Vertical motion: $y_0 = 0, \qquad (v_y) = 0$

$$v_y = -gt \qquad y = -\frac{1}{2}gt^2$$

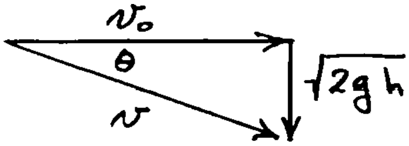
$$t = \sqrt{\frac{2h}{g}},$$ where h is the vertical distance fallen.

$$|v_y| = \sqrt{2gh}$$

Speed: $v^2 = v_x^2 + v_y^2 = v_0^2 + 2gh$

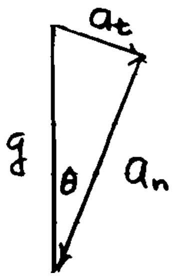
Direction of velocity.

$$\cos\theta = \frac{v_0}{v}$$



Direction of normal acceleration.

$$a_n = g\cos\theta = \frac{gv_0}{v} = \frac{v^2}{\rho}$$



Radius of curvature: $\rho = \dfrac{v^3}{gv_0}$

At Point *B*, $h_B = 1 \text{ m}; \quad x_B = 7 \text{ m}$

$$t_B = \sqrt{\frac{(2)(1 \text{ m})}{9.81 \text{ m/s}^2}} = 0.45152 \text{ s}$$

$$x_B = v_0 t_B \qquad v_0 = \frac{x_B}{t_B} = \frac{7 \text{ m}}{0.45152 \text{ s}} = 15.504 \text{ m/s}$$

$$v_B^2 = (15.504)^2 + (2)(9.81)(1) = 259.97 \text{ m}^2/\text{s}^2$$

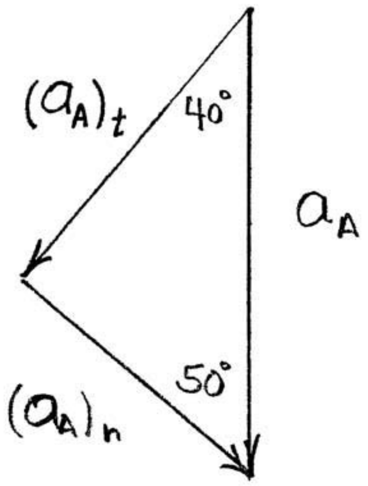
PROBLEM 11.147

Coal is discharged from the tailgate A of a dump truck with an initial velocity $\mathbf{v}_A = 2\text{ m/s} \nearrow 50°$. Determine the radius of curvature of the trajectory described by the coal (*a*) at Point A, (*b*) at the point of the trajectory 1 m below Point A.

SOLUTION



(*a*) At Point A. $a_A = g \downarrow = 9.81\text{ m/s}^2 \downarrow$

Sketch tangential and normal components of acceleration at A.

$$(a_A)_n = g\cos 50°$$

$$\rho_A = \frac{v_A^2}{(a_A)_n} = \frac{(2)^2}{9.81\cos 50°} \qquad \rho_A = 0.634\text{ m} \blacktriangleleft$$

(*b*) At Point B, 1 meter below Point A.

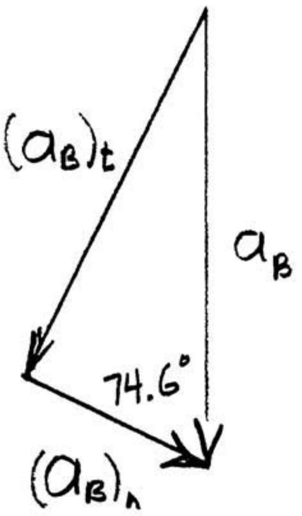
Horizontal motion: $(v_B)_x = (v_A)_x = 2\cos 50° = 1.286\text{ m/s} \leftarrow$

Vertical motion: $(v_B)_y^2 = (v_A)_y^2 + 2a_y(y_B - y_A)$

$$= (2\cos 40°)^2 + (2)(-9.81)(-1)$$

$$= 21.97\text{ m}^2/\text{s}^2$$

$$(v_B)_y = 4.687\text{ m/s} \downarrow$$



$$\tan\theta = \frac{(v_B)_y}{(v_B)_x} = \frac{4.687}{1.286}, \qquad \text{or} \qquad \theta = 74.6°$$

$$a_B = g\cos 74.6°$$

$$\rho_B = \frac{v_B^2}{(a_B)_n} = \frac{(v_B)_x^2 + (v_B)_y^2}{g\cos 74.6°}$$

$$= \frac{(1.286)^2 + 21.97}{9.81\cos 74.6°} \qquad \rho_B = 9.07\text{ m} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.148

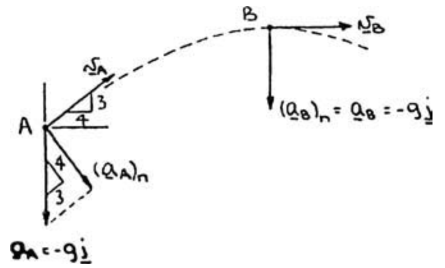
From measurements of a photograph, it has been found that as the stream of water shown left the nozzle at A, it had a radius of curvature of 25 m. Determine (*a*) the initial velocity $\mathbf{v}_A$ of the stream, (*b*) the radius of curvature of the stream as it reaches its maximum height at B.

SOLUTION



(*a*) We have $(a_A)_n = \dfrac{v_A^2}{\rho_A}$

or $v_A^2 = \left[\dfrac{4}{5}(9.81\text{ m/s}^2)\right](25\text{ m})$

or $v_A = 14.0071\text{ m/s}$

$\mathbf{v}_A = 14.01\text{ m/s} \measuredangle 36.9° \blacktriangleleft$

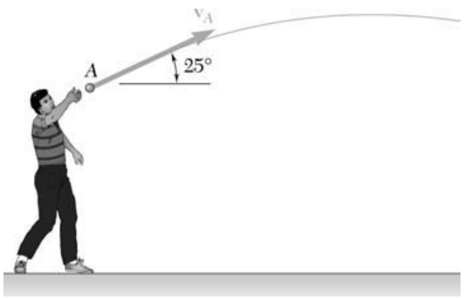
(*b*) We have $(a_B)_n = \dfrac{v_B^2}{\rho_B}$

Where $v_B = (v_A)_x = \dfrac{4}{5}v_A$

Then $\rho_B = \dfrac{\left(\frac{4}{5}\times 14.0071\text{ m/s}\right)^2}{9.81\text{ m/s}^2}$

or $\rho_B = 12.80\text{ m} \blacktriangleleft$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



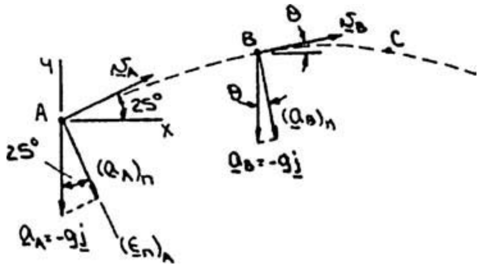
PROBLEM 11.149

A child throws a ball from Point A with an initial velocity $\mathbf{v}_A$ of 20 m/s at an angle of 25° with the horizontal. Determine the velocity of the ball at the points of the trajectory described by the ball where the radius of curvature is equal to three-quarters of its value at A.

SOLUTION

Assume that Points B and C are the points of interest, where $y_B = y_C$ and $v_B = v_C$.

Now $$(a_A)_n = \frac{v_A^2}{\rho_A}$$



or $$\rho_A = \frac{v_A^2}{g\cos 25°}$$

Then $$\rho_B = \frac{3}{4}\rho_A = \frac{3}{4}\frac{v_A^2}{g\cos 25°}$$

We have $$(a_B)_n = \frac{v_B^2}{\rho_B}$$

where $$(a_B)_n = g\cos\theta$$

so that $$\frac{3}{4}\frac{v_A^2}{g\cos 25°} = \frac{v_B^2}{g\cos\theta}$$

or $$v_B^2 = \frac{3}{4}\frac{\cos\theta}{\cos 25°}v_A^2 \qquad (1)$$

Noting that the horizontal motion is uniform, we have

$$(v_A)_x = (v_B)_x$$

where $$(v_A)_x = v_A\cos 25° \qquad (v_B)_x = v_B\cos\theta$$

Then $$v_A\cos 25° = v_B\cos\theta$$

or $$\cos\theta = \frac{v_A}{v_B}\cos 25°$$

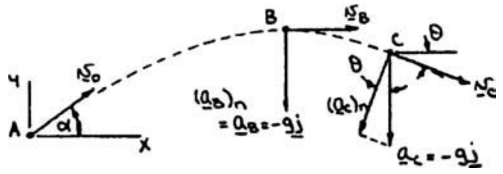
PROBLEM 11.150

A projectile is fired from Point A with an initial velocity $\mathbf{v}_0$. (a) Show that the radius of curvature of the trajectory of the projectile reaches its minimum value at the highest Point B of the trajectory. (b) Denoting by θ the angle formed by the trajectory and the horizontal at a given Point C, show that the radius of curvature of the trajectory at C is $\rho = \rho_{min}/\cos^3\theta$.

SOLUTION

For the arbitrary Point C, we have



$$(a_C)_n = \frac{v_C^2}{\rho_C}$$

or $$\rho_C = \frac{v_C^2}{g\cos\theta}$$

Noting that the horizontal motion is uniform, we have

$$(v_A)_x = (v_C)_x$$

where $$(v_A)_x = v_0\cos\alpha \qquad (v_C)_x = v_C\cos\theta$$

Then $$v_0\cos\alpha = v_C\cos\theta$$

or $$v_C = \frac{\cos\alpha}{\cos\theta}v_0$$

so that $$\rho_C = \frac{1}{g\cos\theta}\left(\frac{\cos\alpha}{\cos\theta}v_0\right)^2 = \frac{v_0^2\cos^2\alpha}{g\cos^3\theta}$$

(a) In the expression for ρ_C, v_0, α, and g are constants, so that ρ_C is minimum where $\cos\theta$ is maximum. By observation, this occurs at Point B where $\theta = 0$.

$$\rho_{min} = \rho_B = \frac{v_0^2\cos^2\alpha}{g}$$ Q.E.D. ◀

(b) $$\rho_C = \frac{1}{\cos^3\theta}\left(\frac{v_0^2\cos^2\alpha}{g}\right)$$

$$\rho_C = \frac{\rho_{min}}{\cos^3\theta}$$ Q.E.D. ◀

PROBLEM 11.151*

Determine the radius of curvature of the path described by the particle of Problem 11.95 when $t = 0$.

PROBLEM 11.95 The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$. Determine the magnitudes of the velocity and acceleration of the particle. (The space curve described by the particle is a conic helix.)

SOLUTION

We have
$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = R(\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + c\mathbf{j} + R(\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}$$

and
$$\mathbf{a} = \frac{d\mathbf{v}}{dt} = R\left(-\omega_n \sin\omega_n t - \omega_n \sin\omega_n t - \omega_n^2 t\cos\omega_n t\right)\mathbf{i}$$
$$+ R\left(\omega_n \cos\omega_n t + \omega_n \cos\omega_n t - \omega_n^2 t\sin\omega_n t\right)\mathbf{k}$$

or
$$\mathbf{a} = \omega_n R[-(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{i} + (2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{k}]$$

Now
$$v^2 = R^2(\cos\omega_n t - \omega_n t\sin\omega_n t)^2 + c^2 + R^2(\sin\omega_n t + \omega_n t\cos\omega_n t)^2$$
$$= R^2\left(1 + \omega_n^2 t^2\right) + c^2$$

Then
$$v = \left[R^2\left(1 + \omega_n^2 t^2\right) + c^2\right]^{1/2}$$

and
$$\frac{dv}{dt} = \frac{R^2\omega_n^2 t}{\left[R^2\left(1 + \omega_n^2 t^2\right) + c^2\right]^{1/2}}$$

Now
$$a^2 = a_t^2 + a_n^2 = \left(\frac{dv}{dt}\right)^2 + \left(\frac{v^2}{\rho}\right)^2$$

At $t = 0$:
$$\frac{dv}{dt} = 0$$
$$\mathbf{a} = \omega_n R(2\mathbf{k}) \quad \text{or} \quad a = 2\omega_n R$$
$$v^2 = R^2 + c^2$$

Then, with
$$\frac{dv}{dt} = 0,$$

we have
$$a = \frac{v^2}{\rho}$$

or
$$2\omega_n R = \frac{R^2 + c^2}{\rho} \qquad \rho = \frac{R^2 + c^2}{2\omega_n R} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.152*

Determine the radius of curvature of the path described by the particle of Problem 11.96 when $t = 0$, $A = 3$, and $B = 1$.

SOLUTION

With $\qquad A = 3, \quad B = 1$

we have
$$\mathbf{r} = (3t\cos t)\mathbf{i} + \left(3\sqrt{t^2+1}\right)\mathbf{j} + (t\sin t)\mathbf{k}$$

Now
$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = 3(\cos t - t\sin t)\mathbf{i} + \left(\frac{3t}{\sqrt{t^2+1}}\right)\mathbf{j} + (\sin t + t\cos t)\mathbf{k}$$

and
$$\mathbf{a} = \frac{d\mathbf{v}}{dt} = 3(-\sin t - \sin t - t\cos t)\mathbf{i} + 3\left[\frac{\sqrt{t^2+1} - t\left(\frac{t}{\sqrt{t^2+1}}\right)}{t^2+1}\right]\mathbf{j}$$
$$+ (\cos t + \cos t - t\sin t)\mathbf{k}$$
$$= -3(2\sin t + t\cos t)\mathbf{i} + 3\frac{1}{(t^2+1)^{1/2}}\mathbf{j}$$
$$+ (2\cos t - t\sin t)\mathbf{k}$$

Then
$$v^2 = 9(\cos t - t\sin t)^2 + 9\frac{t^2}{t^2+1} + (\sin t + t\cos t)^2$$

Expanding and simplifying yields
$$v^2 = t^4 + 19t^2 + 1 + 8(\cos^2 t + t^4\sin^2 t) - 8(t^3 + t)\sin 2t$$

Then
$$v = [t^4 + 19t^2 + 1 + 8(\cos^2 t + t^4\sin^2 t) - 8(t^3 + t)\sin 2t]^{1/2}$$

and
$$\frac{dv}{dt} = \frac{4t^3 + 38t + 8(-2\cos t\sin t + 4t^3\sin^2 t + 2t^4\sin t\cos t) - 8[(3t^2+1)\sin 2t + 2(t^3+t)\cos 2t]}{2[t^4 + 19t^2 + 1 + 8(\cos^2 t + t^4\sin^2 t) - 8(t^3+t)\sin 2t]^{1/2}}$$

Now
$$a^2 = a_t^2 + a_n^2 = \left(\frac{dv}{dt}\right)^2 + \left(\frac{v^2}{\rho}\right)^2$$

PROBLEM 11.153

A satellite will travel indefinitely in a circular orbit around a planet if the normal component of the acceleration of the satellite is equal to $g(R/r)^2$, where g is the acceleration of gravity at the surface of the planet, R is the radius of the planet, and r is the distance from the center of the planet to the satellite. Knowing that the diameter of the sun is 1.39 Gm and that the acceleration of gravity at its surface is 274 m/s^2, determine the radius of the orbit of the indicated planet around the sun assuming that the orbit is circular.

Earth: $(v_{\text{mean}})_{\text{orbit}} = 107 \text{ Mm/h}$.

SOLUTION

For the sun, $g = 274 \text{ m/s}^2$,

and $R = \frac{1}{2}D = \left(\frac{1}{2}\right)(1.39 \times 10^9) = 0.695 \times 10^9 \text{ m}$

Given that $a_n = \frac{gR^2}{r^2}$ and that for a circular orbit $a_n = \frac{v^2}{r}$

Eliminating a_n and solving for r, $r = \frac{gR^2}{v^2}$

For the planet Earth, $v = 107 \times 10^6 \text{ m/h} = 29.72 \times 10^3 \text{ m/s}$

Then $r = \frac{(274)(0.695 \times 10^9)^2}{(29.72 \times 10^3)^2} = 149.8 \times 10^9 \text{ m}$ $r = 149.8 \text{ Gm}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.154

A satellite will travel indefinitely in a circular orbit around a planet if the normal component of the acceleration of the satellite is equal to $g(R/r)^2$, where g is the acceleration of gravity at the surface of the planet, R is the radius of the planet, and r is the distance from the center of the planet to the satellite. Knowing that the diameter of the sun is 1.39 Gm and that the acceleration of gravity at its surface is 274 m/s^2, determine the radius of the orbit of the indicated planet around the sun assuming that the orbit is circular.

Saturn: $(v_{\text{mean}})_{\text{orbit}} = 34.7\text{ Mm/h}$.

SOLUTION

For the sun, $$g = 274\text{ m/s}^2$$

and $$R = \frac{1}{2}D = \left(\frac{1}{2}\right)(1.39 \times 10^9) = 0.695 \times 10^9\text{ m}$$

Given that $a_n = \dfrac{gR^2}{r^2}$ .and that for a circular orbit: $a_n = \dfrac{v^2}{r}$

Eliminating a_n and solving for r, $$r = \frac{gR^2}{v^2}$$

For the planet Saturn, $$v = 34.7 \times 10^6\text{m/h} = 9.639 \times 10^3\text{m/s}$$

Then, $$r = \frac{(274)(0.695 \times 10^9)^2}{(9.639 \times 10^3)^2} = 1.425 \times 10^{12}\text{ m}$$

$r = 1425\text{ Gm}$ ◀

PROBLEM 11.155

Determine the speed of a satellite relative to the indicated planet if the satellite is to travel indefinitely in a circular orbit 100 mi above the surface of the planet. (See information given in Problems 11.153–11.154).

Venus: $g = 29.20\text{ ft/s}^2,\ R = 3761\text{ mi.}$

SOLUTION

From Problems 11.153 and 11.154,
$$a_n = \frac{gR^2}{r^2}$$

For a circular orbit,
$$a_n = \frac{v^2}{r}$$

Eliminating a_n and solving for v,
$$v = R\sqrt{\frac{g}{r}}$$

For Venus,
$$g = 29.20\text{ ft/s}^2$$
$$R = 3761\text{ mi} = 19.858 \times 10^6\text{ ft.}$$
$$r = 3761 + 100 = 3861\text{ mi} = 20.386 \times 10^6\text{ ft}$$

Then,
$$v = 19.858 \times 10^6 \sqrt{\frac{29.20}{20.386 \times 10^6}} = 23.766 \times 10^3\text{ ft/s}$$

$v = 16200\text{ mi/h}$ ◀

PROBLEM 11.156

Determine the speed of a satellite relative to the indicated planet if the satellite is to travel indefinitely in a circular orbit 100 mi above the surface of the planet. (See information given in Problems 11.153–11.154).

Mars: $g = 12.17\ \text{ft/s}^2,\ R = 2102\ \text{mi}.$

SOLUTION

From Problems 11.153 and 11.154, $a_n = \dfrac{gR^2}{r^2}$

For a circular orbit, $a_n = \dfrac{v^2}{r}$

Eliminating a_n and solving for v, $v = R\sqrt{\dfrac{g}{r}}$

For Mars, $g = 12.17\ \text{ft/s}^2$

$$R = 2102\ \text{mi} = 11.0986 \times 10^6\ \text{ft}$$

$$r = 2102 + 100 = 2202\ \text{mi} = 11.6266 \times 10^6\ \text{ft}$$

Then, $$v = 11.0986 \times 10^6 \sqrt{\frac{12.17}{11.6266 \times 10^6}} = 11.35 \times 10^3\ \text{ft/s}$$

$v = 7740$ mi/h ◀

PROBLEM 11.157

Determine the speed of a satellite relative to the indicated planet if the satellite is to travel indefinitely in a circular orbit 100 mi above the surface of the planet. (See information given in Problems 11.153–11.154).

Jupiter: $g = 75.35 \text{ ft/s}^2$, $R = 44,432$ mi.

SOLUTION

From Problems 11.153 and 11.154, $$a_n = \frac{gR^2}{r^2}$$

For a circular orbit, $$a_n = \frac{v^2}{r}$$

Eliminating a_n and solving for v, $$v = R\sqrt{\frac{g}{r}}$$

For Jupiter, $$g = 75.35 \text{ ft/s}^2$$

$$R = 44432 \text{ mi} = 234.60 \times 10^6 \text{ ft}$$

$$r = 44432 + 100 = 44532 \text{ mi} = 235.13 \times 10^6 \text{ ft}$$

Then, $$v = (234.60 \times 10^6)\sqrt{\frac{75.35}{235.13 \times 10^6}} = 132.8 \times 10^3 \text{ ft/s}$$

$v = 90600$ mi/h ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 11.158

A satellite is traveling in a circular orbit around Mars at an altitude of 300 km. After the altitude of the satellite is adjusted, it is found that the time of one orbit has increased by 10 percent. Knowing that the radius of Mars is 3382 km, determine the new altitude of the satellite. (See information given in Problems 11.153–11.155.)

SOLUTION

We have $$a_n = g\frac{R^2}{r^2} \quad \text{and} \quad a_n = \frac{v^2}{r}$$

Then $$g\frac{R^2}{r^2} = \frac{v^2}{r}$$

$$v = R\sqrt{\frac{g}{r}} \quad \text{where} \quad r = R + h$$

The circumference s of a circular orbit is equal to

$$s = 2\pi r$$

Assuming that the speed of the satellite in each orbit is constant, we have

$$s = vt_{\text{orbit}}$$

Substituting for s and v

$$2\pi r = R\sqrt{\frac{g}{r}}\, t_{\text{orbit}}$$

$$t_{\text{orbit}} = \frac{2\pi}{R}\frac{r^{3/2}}{\sqrt{g}}$$

$$= \frac{2\pi}{R}\frac{(R+h)^{3/2}}{\sqrt{g}}$$

Now $$(t_{\text{orbit}})_2 = 1.1(t_{\text{orbit}})_1$$

$$\frac{2\pi}{R}\frac{(R+h_2)^{3/2}}{\sqrt{g}} = 1.1\frac{2\pi}{R}\frac{(R+h_1)^{3/2}}{\sqrt{g}}$$

$$h_2 = (1.1)^{2/3}(R+h_1) - R$$

$$= (1.1)^{2/3}(3382+300)\text{ km} - (3382\text{ km})$$

$$h_2 = 542\text{ km} \blacktriangleleft$$

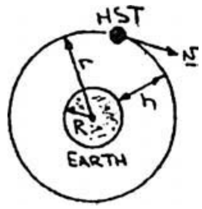
PROBLEM 11.159

Knowing that the radius of the earth is 6370 km, determine the time of one orbit of the Hubble Space Telescope, knowing that the telescope travels in a circular orbit 590 km above the surface of the earth. (See information given in Problems 11.153–11.155.)

SOLUTION



We have $$a_n = g\frac{R^2}{r^2} \quad \text{and} \quad a_n = \frac{v^2}{r}$$

Then $$g\frac{R^2}{r^2} = \frac{v^2}{r}$$

or $$v = R\sqrt{\frac{g}{r}} \quad \text{where} \quad r = R + h$$

The circumference s of the circular orbit is equal to

$$s = 2\pi r$$

Assuming that the speed of the telescope is constant, we have

$$s = vt_{\text{orbit}}$$

Substituting for s and v

$$2\pi r = R\sqrt{\frac{g}{r}}\, t_{\text{orbit}}$$

or $$t_{\text{orbit}} = \frac{2\pi}{R}\frac{r^{3/2}}{\sqrt{g}}$$

$$= \frac{2\pi}{6370 \text{ km}}\frac{[(6370+590) \text{ km}]^{3/2}}{[9.81\times10^{-3} \text{ km/s}^2]^{1/2}}\times\frac{1 \text{ h}}{3600 \text{ s}}$$

or $$t_{\text{orbit}} = 1.606 \text{ h} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 11.160

Satellites A and B are traveling in the same plane in circular orbits around the earth at altitudes of 120 and 200 mi, respectively. If at $t = 0$ the satellites are aligned as shown and knowing that the radius of the earth is $R = 3960$ mi, determine when the satellites will next be radially aligned. (See information given in Problems 11.153–11.155.)

SOLUTION

We have $$a_n = g\frac{R^2}{r^2} \quad \text{and} \quad a_n = \frac{v^2}{r}$$

Then $$g\frac{R^2}{r^2} = \frac{v^2}{r} \quad \text{or} \quad v = R\sqrt{\frac{g}{r}}$$

where $$r = R + h$$

The circumference s of a circular orbit is

equal to $$s = 2\pi r$$

Assuming that the speeds of the satellites are constant, we have

$$s = vT$$

Substituting for s and v

$$2\pi r = R\sqrt{\frac{g}{r}}T$$

or $$T = \frac{2\pi}{R}\frac{r^{3/2}}{\sqrt{g}} = \frac{2\pi}{R}\frac{(R+h)^{3/2}}{\sqrt{g}}$$

Now $$h_B > h_A \Rightarrow (T)_B > (T)_A$$

Next let time T_C be the time at which the satellites are next radially aligned. Then, if in time T_C satellite B completes N orbits, satellite A must complete $(N+1)$ orbits.

Thus,

$$T_C = N(T)_B = (N+1)(T)_A$$

or $$N\left[\frac{2\pi}{R}\frac{(R+h_B)^{3/2}}{\sqrt{g}}\right] = (N+1)\left[\frac{2\pi}{R}\frac{(R+h_A)^{3/2}}{\sqrt{g}}\right]$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.160 (Continued)

or $$N = \frac{(R+h_A)^{3/2}}{(R+h_B)^{3/2} - (R+h_A)^{3/2}} = \frac{1}{\left(\frac{R+h_B}{R+h_A}\right)^{3/2} - 1}$$

$$= \frac{1}{\left(\frac{3960+200}{3960+120}\right)^{3/2} - 1} = 33.835 \text{ orbits}$$

Then $$T_C = N(T)_B = N\frac{2\pi}{R}\frac{(R+h_B)^{3/2}}{\sqrt{g}}$$

$$= 33.835\frac{2\pi}{3960 \text{ mi}}\frac{[(3960+200)\text{ mi}]^{3/2}}{\left(32.2\text{ ft/s}^2 \times \frac{1\text{ mi}}{5280\text{ ft}}\right)^{1/2}} \times \frac{1\text{ h}}{3600\text{ s}}$$

or $T_C = 51.2$ h ◀

<u>Alternative solution</u>

From above, we have $(T)_B > (T)_A$. Thus, when the satellites are next radially aligned, the angles θ_A and θ_B swept out by radial lines drawn to the satellites must differ by 2π. That is,

$$\theta_A = \theta_B + 2\pi$$

For a circular orbit $$s = r\theta$$

From above $$s = vt \quad \text{and} \quad v = R\sqrt{\frac{g}{r}}$$

Then $$\theta = \frac{s}{r} = \frac{vt}{r} = \frac{1}{r}\left(R\sqrt{\frac{g}{r}}\right)t = \frac{R\sqrt{g}}{r^{3/2}}t = \frac{R\sqrt{g}}{(R+h)^{3/2}}t$$

At time T_C: $$\frac{R\sqrt{g}}{(R+h_A)^{3/2}}T_C = \frac{R\sqrt{g}}{(R+h_B)^{3/2}}T_C + 2\pi$$

or $$T_C = \frac{2\pi}{R\sqrt{g}\left[\frac{1}{(R+h_A)^{3/2}} - \frac{1}{(R+h_B)^{3/2}}\right]}$$

$$= \frac{2\pi}{(3960\text{ mi})\left(32.2\text{ ft/s}^2 \times \frac{1\text{ mi}}{5280\text{ ft}}\right)^{1/2}}$$

$$\times \frac{1}{\frac{1}{[(3960+120)\text{ mi}]^{3/2}} - \frac{1}{[(3960+200)\text{ mi}]^{3/2}}}$$

$$\times \frac{1\text{ h}}{3600\text{ s}}$$

or $T_C = 51.2$ h ◀

PROBLEM 11.161

The oscillation of rod OA about O is defined by the relation $\theta = (3/\pi)(\sin \pi t)$, where θ and t are expressed in radians and seconds, respectively. Collar B slides along the rod so that its distance from O is $r = 6(1 - e^{-2t})$ where r and t are expressed in inches and seconds, respectively. When $t = 1$ s, determine (a) the velocity of the collar, (b) the acceleration of the collar, (c) the acceleration of the collar relative to the rod.

SOLUTION

Calculate the derivatives with respect to time.

$$r = 6 - 6e^{-2t} \text{ in.} \qquad \theta = \frac{3}{\pi}\sin \pi t \text{ rad}$$

$$\dot{r} = 12e^{-2t} \text{ in/s} \qquad \dot{\theta} = 3\cos \pi t \text{ rad/s}$$

$$\ddot{r} = -24e^{-2t} \text{ in/s}^2 \qquad \ddot{\theta} = -3\pi \sin \pi t \text{ rad/s}^2$$

At $t = 1$ s,

$$r = 6 - 6e^{-2} = 5.1880 \text{ in.} \qquad \theta = \frac{3}{\pi}\sin \pi = 0$$

$$\dot{r} = 12e^{-2} = 1.6240 \text{ in/s} \qquad \dot{\theta} = 3\cos \pi = -3 \text{ rad/s}$$

$$\ddot{r} = -24e^{-2} = -3.2480 \text{ in/s}^2 \qquad \ddot{\theta} = -3\pi \sin \pi = 0$$

(a) *Velocity of the collar.*

$$\mathbf{v} = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta = 1.6240\,\mathbf{e}_r + (5.1880)(-3)\mathbf{e}_\theta$$

$$\mathbf{v} = (1.624 \text{ in/s})\mathbf{e}_r + (15.56 \text{ in/s})\mathbf{e}_\theta \blacktriangleleft$$

(b) *Acceleration of the collar.*

$$\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$

$$= [-3.2480 - (5.1880)(-3)^2]\mathbf{e}_r + (5.1880)(0) + (2)(1.6240)(-3)]\mathbf{e}_\theta$$

$$(-49.9 \text{ in/s}^2)\mathbf{e}_r + (-9.74 \text{ in/s}^2)\mathbf{e}_\theta \blacktriangleleft$$

(c) *Acceleration of the collar relative to the rod.*

$$\mathbf{a}_{B/OA} = \ddot{r}\mathbf{e}_r \qquad \mathbf{a}_{B/OA} = (-3.25 \text{ in/s}^2)\mathbf{e}_r \blacktriangleleft$$

PROBLEM 11.162

The rotation of rod OA about O is defined by the relation $\theta = t^3 - 4t$, where θ and t are expressed in radians and seconds, respectively. Collar B slides along the rod so that its distance from O is $r = 2.5t^3 - 5t^2$, where r and t are expressed in inches and seconds, respectively. When $t = 1$ s, determine (a) the velocity of the collar, (b) the acceleration of the collar, (c) the radius of curvature of the path of the collar.

SOLUTION

Calculate the derivatives with respect to time.

$$r = 2.5t^3 - 5t^2 \qquad \theta = t^3 - 4t$$

$$\dot{r} = 7.5t^2 - 10t \qquad \dot{\theta} = 3t^2 - 4$$

$$\ddot{r} = 15t - 10 \qquad \ddot{\theta} = 6t$$

At $t = 1$ s,

$$r = 2.5 - 5 = -2.5 \text{ in.} \qquad \theta = 1 - 4 = -3 \text{ rad}$$

$$\dot{r} = 7.5 - 10 = -2.5 \text{ in./s} \qquad \dot{\theta} = 3 - 4 = -1 \text{ rad/s}$$

$$\ddot{r} = 15 - 10 = 5 \text{ in./s}^2 \qquad \ddot{\theta} = 6 \text{ rad/s}^2$$

(a) <u>*Velocity of the collar*</u>.

$$\mathbf{v} = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta = -2.5\mathbf{e}_r + (-2.5)(-1)\mathbf{e}_\theta$$

$$\mathbf{v} = (-2.50 \text{ in./s})\mathbf{e}_r + (2.50 \text{ in./s})\mathbf{e}_\theta \blacktriangleleft$$

$$v = \sqrt{(2.50)^2 + (2.50)^2} = 3.5355 \text{ in./s}$$

Unit vector tangent to the path.

$$\mathbf{e}_t = \frac{\mathbf{v}}{v} = -0.70711\mathbf{e}_r + 0.70711\mathbf{e}_\theta$$

(b) <u>*Acceleration of the collar*</u>.

$$\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$

$$= [5 - (-2.5)(-1)^2]\mathbf{e}_r + [(-2.5)(6) + (2)(-2.5)(-1)]\mathbf{e}_\theta$$

$$\mathbf{a} = (7.50 \text{ in/s}^2)\mathbf{e}_r + (-10.00 \text{ in/s}^2)\mathbf{e}_\theta \blacktriangleleft$$

PROBLEM 11.163

The path of particle P is the ellipse defined by the relations $r = 2/(2 - \cos \pi t)$ and $\theta = \pi t$, where r is expressed in meters, t is in seconds, and θ is in radians. Determine the velocity and the acceleration of the particle when (*a*) $t = 0$, (*b*) $t = 0.5$ s.

SOLUTION

We have $$r = \frac{2}{2 - \cos \pi t} \qquad \theta = \pi t$$

Then $$\dot{r} = \frac{-2\pi \sin \pi t}{(2 - \cos \pi t)^2} \qquad \dot{\theta} = \pi$$

and $$\ddot{r} = -2\pi \frac{\pi \cos \pi t(2 - \cos \pi t) - \sin \pi t(2\pi \sin \pi t)}{(2 - \cos \pi t)^3} \qquad \ddot{\theta} = 0$$

$$= -2\pi^2 \frac{2\cos \pi t - 1 - \sin^2 \pi t}{(2 - \cos \pi t)^3}$$

(*a*) At $t = 0$: $r = 2$ m $\qquad \theta = 0$

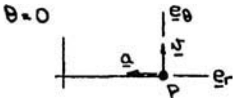
$\dot{r} = 0 \qquad \dot{\theta} = \pi$ rad/s

$\ddot{r} = -2\pi^2 \text{m/s}^2 \qquad \ddot{\theta} = 0$

Now $$\mathbf{v} = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta = (2)(\pi)\mathbf{e}_\theta$$

or $$\mathbf{v} = (2\pi \text{ m/s})\mathbf{e}_\theta \blacktriangleleft$$

and $$\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$
$$= [-2\pi^2 - (2)(\pi)^2]\mathbf{e}_r$$



or $$\mathbf{a} = -(4\pi^2 \text{m/s}^2)\mathbf{e}_r \blacktriangleleft$$

(*b*) At $t = 0.5$ s: $r = 1$ m $\qquad \theta = \frac{\pi}{2}$ rad

$$\dot{r} = \frac{-2\pi}{(2)^2} = -\frac{\pi}{2} \text{ m/s} \qquad \dot{\theta} = \pi \text{ rad/s}$$

$$\ddot{r} = -2\pi^2 \frac{-1-1}{(2)^3} = \frac{\pi^2}{2} \text{ m/s}^2 \qquad \ddot{\theta} = 0$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.164

The two-dimensional motion of a particle is defined by the relations $r = 2a\cos\theta$ and $\theta = bt^2/2,$ where a and b are constants. Determine (a) the magnitudes of the velocity and acceleration at any instant, (b) the radius of curvature of the path. What conclusion can you draw regarding the path of the particle?

SOLUTION

(a) We have $\quad r = 2a\cos\theta \qquad \theta = \frac{1}{2}bt^2$

Then $\quad \dot{r} = -2a\dot{\theta}\sin\theta \qquad \dot{\theta} = bt$

and $\quad \ddot{r} = -2a(\ddot{\theta}\ \sin\theta + \dot{\theta}^2\cos\theta) \qquad \ddot{\theta} = b$

Substituting for $\dot{\theta}$ and $\ddot{\theta}$

$$\dot{r} = -2abt\sin\theta$$

$$\ddot{r} = -2ab(\sin\theta + bt^2\cos\theta)$$

Now $\quad v_r = \dot{r} = -2abt\sin\theta \qquad v_\theta = r\dot{\theta} = 2abt\cos\theta$

Then $\quad v = \sqrt{v_r^2 + v_\theta^2} = 2abt[(-\sin\theta)^2 + (\cos\theta)^2]^{1/2}$

or $\quad v = 2abt$ ◀

Also
$$a_r = \ddot{r} - r\dot{\theta}^2 = -2ab(\sin\theta + bt^2\cos\theta) - 2ab^2t^2\cos\theta$$
$$= -2ab(\sin\theta + 2bt^2\cos\theta)$$

and
$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = 2ab\cos\theta - 4ab^2t^2\sin\theta$$
$$= -2ab(\cos\theta - 2bt^2\sin\theta)$$

Then
$$a = \sqrt{a_r^2 + a_B^2} = 2ab[(\sin\theta + 2bt^2\cos\theta)^2 + (\cos\theta - 2bt^2\sin\theta)^2]^{1/2}$$

or $\quad a = 2ab\sqrt{1 + 4b^2t^4}$ ◀

(b) Now $\quad a^2 = a_t^2 + a_n^2 = \left(\frac{dv}{dt}\right)^2 + \left(\frac{v^2}{\rho}\right)^2$

Then $\quad \frac{dv}{dt} = \frac{d}{dt}(2abt) = 2ab$

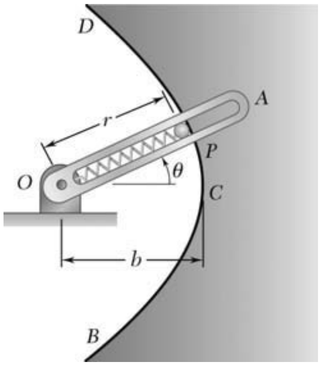
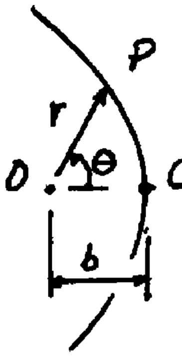
PROBLEM 11.165



As rod *OA* rotates, pin *P* moves along the parabola *BCD*. Knowing that the equation of this parabola is $r = 2b/(1+\cos\theta)$ and that $\theta = kt$, determine the velocity and acceleration of *P* when (*a*) $\theta = 0$, (*b*) $\theta = 90°$.

SOLUTION



$$r = \frac{2b}{1+\cos kt} \qquad \theta = kt$$

$$\dot{r} = \frac{2bk\sin kt}{(1+\cos kt)^2} \qquad \dot{\theta} = k \qquad \ddot{\theta} = 0$$

$$\ddot{r} = \frac{2bk}{(1+\cos kt)^4}[(1+\cos kt)^2 k\cos kt + (\sin kt)2(1+\cos kt)(k\sin kt)]$$

(*a*) <u>When $\theta = kt = 0$</u>:

$$r = b \qquad \dot{r} = 0 \qquad \ddot{r} = \frac{2bk}{(2)^4}[(2)^2 k(1) + 0] = \frac{1}{2}bk^2$$

$$\theta = 0 \qquad \dot{\theta} = k \qquad \ddot{\theta} = 0$$

$$v_r = \dot{r} = 0 \qquad v_\theta = r\dot{\theta} = bk$$

$$\mathbf{v} = bk\,\mathbf{e}_\theta \blacktriangleleft$$

$$\left.\begin{aligned} a_r &= \ddot{r} - r\dot{\theta}^2 = \frac{1}{2}bk^2 - bk^2 = -\frac{1}{2}bk^2 \\ a_\theta &= r\ddot{\theta} + 2\dot{r}\dot{\theta} = b(0) + 2(0) = 0 \end{aligned}\right\}$$

$$\mathbf{a} = -\frac{1}{2}bk^2\mathbf{e}_r \blacktriangleleft$$

(*b*) <u>When $\theta = kt = 90°$</u>:

$$r = 2b \qquad \dot{r} = 2bk \qquad \ddot{r} = \frac{2bk}{19}[0 + 2k] = 4bk^2$$

$$\theta = 90° \qquad \dot{\theta} = k \qquad \ddot{\theta} = 0$$

$$v_r = \dot{r} = 2bk \qquad v_\theta = r\dot{\theta} = 2bk$$

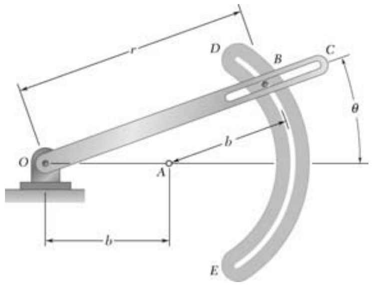
$$\mathbf{v} = 2bk\,\mathbf{e}_r + 2bk\,\mathbf{e}_\theta \blacktriangleleft$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = 4bk^2 - 2bk^2 = 2bk^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = 2b(0) + 2(2bk)k = 4bk^2$$

$$\mathbf{a} = 2bk^2\mathbf{e}_r + 4bk^2\mathbf{e}_\theta \blacktriangleleft$$

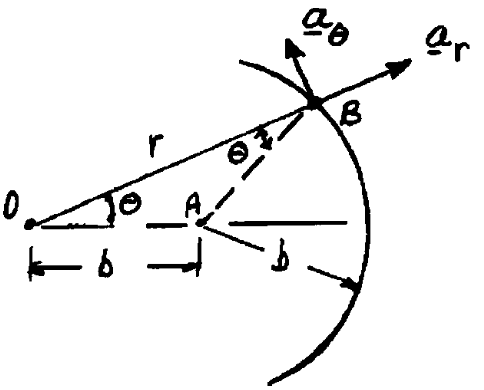
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 11.166

The pin at B is free to slide along the circular slot DE and along the rotating rod OC. Assuming that the rod OC rotates at a constant rate $\dot{\theta}$, (*a*) show that the acceleration of pin B is of constant magnitude, (*b*) determine the direction of the acceleration of pin B.

SOLUTION



From the sketch:

$$r = 2b\cos\theta$$
$$\dot{r} = -2b\sin\theta\,\dot{\theta}$$

Since $\dot{\theta} = \text{constant}, \quad \ddot{\theta} = 0$

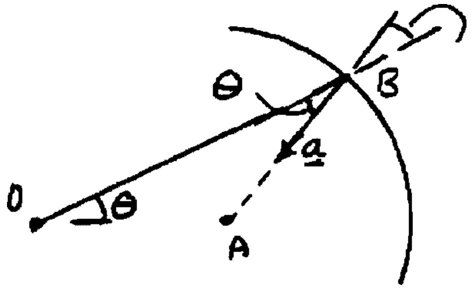
$$\ddot{r} = -2b\cos\theta\,\dot{\theta}^2$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = -2b\cos\theta\,\dot{\theta}^2 - (2b\cos\theta)\dot{\theta}^2$$
$$a_r = -4b\cos\theta\,\dot{\theta}^2$$
$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = (2b\cos\theta)(0) + 2(-2b\sin\theta)\dot{\theta}^2$$
$$a_\theta = -4b\sin\theta\,\dot{\theta}^2$$

$$a = \sqrt{a_r^2 + a_\theta^2} = 4b\dot{\theta}^2\sqrt{(-\cos\theta)^2 + (-\sin\theta)^2}$$
$$a = 4b\dot{\theta}^2$$

Since both b and $\dot{\theta}$ are constant, we find that

$a = \text{constant}$ ◀

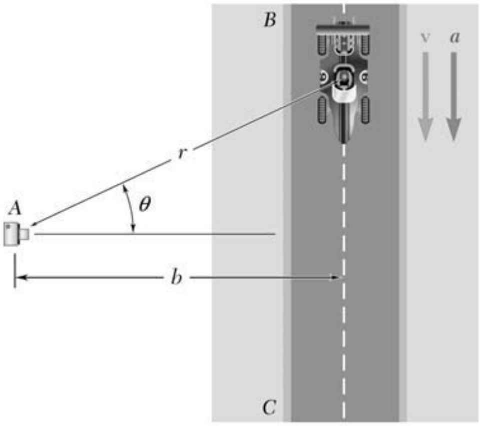


$$\gamma = \tan^{-1}\frac{a_\theta}{a_r} = \tan^{-1}\left(\frac{-4b\sin\theta\,\dot{\theta}^2}{-4b\cos\theta\,\dot{\theta}^2}\right)$$
$$\gamma = \tan^{-1}(\tan\theta)$$
$$\gamma = \theta$$

Thus, **a** is directed toward A ◀

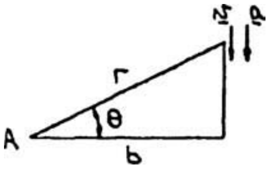
All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.167



To study the performance of a racecar, a high-speed camera is positioned at Point *A*. The camera is mounted on a mechanism which permits it to record the motion of the car as the car travels on straightway *BC*. Determine (*a*) the speed of the car in terms of b, θ, and $\dot{\theta}$, (*b*) the magnitude of the acceleration in terms of b, θ, $\dot{\theta}$, and $\ddot{\theta}$.

SOLUTION



(*a*) We have $$r = \frac{b}{\cos\theta}$$

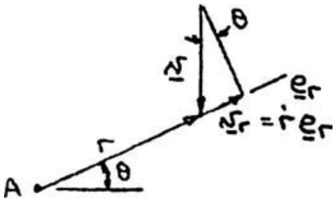
Then $$\dot{r} = \frac{b\dot{\theta}\sin\theta}{\cos^2\theta}$$

We have
$$v^2 = v_r^2 + v_\theta^2 = (\dot{r})^2 + (r\dot{\theta})^2$$
$$= \left(\frac{b\theta\sin\theta}{\cos^2\theta}\right)^2 + \left(\frac{b\theta}{\cos\theta}\right)^2$$
$$= \frac{b^2\dot{\theta}^2}{\cos^2\theta}\left(\frac{\sin^2\theta}{\cos^2\theta} + 1\right) = \frac{b^2\dot{\theta}^2}{\cos^4\theta}$$

or $$v = \pm\frac{b\dot{\theta}}{\cos^2\theta}$$

For the position of the car shown, θ is decreasing; thus, the negative root is chosen. $v = -\dfrac{b\dot{\theta}}{\cos^2\theta}$ ◀

<u>Alternative solution</u>.



From the diagram $$\dot{r} = -v\sin\theta$$

or $$\frac{b\dot{\theta}\sin\theta}{\cos^2\theta} = -v\sin\theta$$

or $v = -\dfrac{b\dot{\theta}}{\cos^2\theta}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) For rectilinear motion $$a = \frac{dv}{dt}$$

Using the answer from Part *a*

$$v = -\frac{b\dot{\theta}}{\cos^2\theta}$$

Then $$a = \frac{d}{dt}\left(-\frac{b\dot{\theta}}{\cos^2\theta}\right)$$

$$= -b\frac{\ddot{\theta}\cos^2\theta - \dot{\theta}(-2\dot{\theta}\cos\theta\sin\theta)}{\cos^4\theta}$$

or $$a = -\frac{b}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta) \blacktriangleleft$$

<u>Alternative solution</u>

From above $$r = \frac{b}{\cos\theta} \quad \dot{r} = \frac{b\dot{\theta}\sin\theta}{\cos^2\theta}$$

Then $$\ddot{r} = b\frac{(\ddot{\theta}\sin\theta + \dot{\theta}^2\cos\theta)(\cos^2\theta) - (\dot{\theta}\sin\theta)(-2\dot{\theta}\cos\theta\sin\theta)}{\cos^4\theta}$$

$$= b\left[\frac{\ddot{\theta}\sin\theta}{\cos^2\theta} + \frac{\dot{\theta}^2(1+\sin^2\theta)}{\cos^3\theta}\right]$$

Now $$a^2 = a_r^2 + a_\theta^2$$

where $$a_r = \ddot{r} - r\dot{\theta}^2 = b\left[\frac{\ddot{\theta}\sin\theta}{\cos^2\theta} + \frac{\dot{\theta}^2(1+\sin^2\theta)}{\cos^2\theta}\right] - \frac{b\dot{\theta}^2}{\cos\theta}$$

$$= \frac{b}{\cos^2\theta}\left(\ddot{\theta}\sin\theta + \frac{2\dot{\theta}^2\sin^2\theta}{\cos\theta}\right)$$

$$a_r = \frac{b\sin\theta}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta)$$

and $$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = \frac{b\ddot{\theta}}{\cos\theta} + 2\frac{b\dot{\theta}^2\sin\theta}{\cos^2\theta}$$

$$= \frac{b\cos\theta}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}\tan\theta)$$

Then $$a = \pm\frac{b}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta)[(\sin\theta)^2 + (\cos\theta)^2]^{1/2}$$

For the position of the car shown, $\ddot{\theta}$ is negative; for *a* to be positive, the negative root is chosen.

$$a = -\frac{b}{\cos^2\theta}(\ddot{\theta} + 2\dot{\theta}^2\tan\theta) \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.168

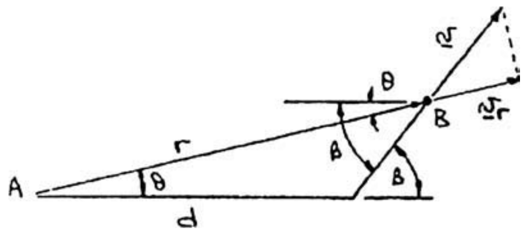
After taking off, a helicopter climbs in a straight line at a constant angle β. Its flight is tracked by radar from Point A. Determine the speed of the helicopter in terms of d, β, θ, and $\dot{\theta}$.

SOLUTION

From the diagram

$$\frac{r}{\sin(180° - \beta)} = \frac{d}{\sin(\beta - \theta)}$$



or $$d \sin\beta = r(\sin\beta\cos\theta - \cos\beta\sin\theta)$$

or $$r = d\frac{\tan\beta}{\tan\beta\cos\theta - \sin\theta}$$

Then $$\dot{r} = d\tan\beta\frac{-(-\tan\beta\sin\theta - \cos\theta)}{(\tan\beta\cos\theta - \sin\theta)^2}\dot{\theta}$$

$$= d\dot{\theta}\tan\beta\frac{\tan\beta\sin\theta + \cos\theta}{(\tan\beta\cos\theta - \sin\theta)^2}$$

From the diagram

$$v_r = v\cos(\beta - \theta) \qquad \text{where} \qquad v_r = \dot{r}$$

Then

$$d\dot{\theta}\tan\beta\frac{\tan\beta\sin\theta + \cos\theta}{(\tan\beta\cos\theta - \sin\theta)^2} = v(\cos\beta\cos\theta + \sin\beta\sin\theta)$$

$$= v\cos\beta(\tan\beta\sin\theta + \cos\theta)$$

or $$v = \frac{d\dot{\theta}\tan\beta\sec\beta}{(\tan\beta\cos\theta - \sin\theta)^2} \blacktriangleleft$$

Alternative solution.

We have $$v^2 = v_r^2 + v_\theta^2 = (\dot{r})^2 + (r\dot{\theta})^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.168 (Continued)

Using the expressions for r and $\dot{r}$ from above

$$v = \left[d\dot{\theta} \tan\beta \frac{\tan\beta \sin\theta + \cos\theta}{(\tan\beta\cos\theta - \sin\theta)^2} \right]^2$$

or

$$v = \pm \frac{d\dot{\theta}\tan\beta}{(\tan\beta\cos\theta - \sin\theta)} \left[\frac{(\tan\beta\sin\theta + \cos\theta)^2}{(\tan\beta\cos\theta - \sin\theta)^2} + 1 \right]^{1/2}$$

$$= \pm \frac{d\dot{\theta}\tan\beta}{(\tan\beta\cos\theta - \sin\theta)} \left[\frac{\tan^2\beta + 1}{(\tan\beta\cos\theta - \sin\theta)^2} \right]^{1/2}$$

Note that as θ increases, the helicopter moves in the indicated direction. Thus, the positive root is chosen.

$$v = \frac{d\dot{\theta}\tan\beta\sec\beta}{(\tan\beta\cos\theta - \sin\theta)^2} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.169

At the bottom of a loop in the vertical plane, an airplane has a horizontal velocity of 315 mi/h and is speeding up at a rate of 10 ft/s^2. The radius of curvature of the loop is 1 mi. The plane is being tracked by radar at *O*. What are the recorded values of $\dot{r}$, $\ddot{r}$, $\dot{\theta}$ and $\ddot{\theta}$ for this instant?

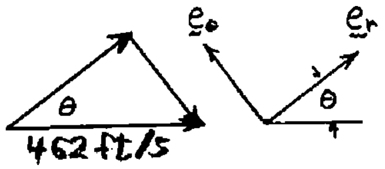
SOLUTION

Geometry. The polar coordinates are

$$r = \sqrt{(2400)^2 + (1800)^2} = 3000 \text{ ft} \qquad \theta = \tan^{-1}\left(\frac{1800}{2400}\right) = 36.87°$$

Velocity Analysis.

$$\mathbf{v} = 315 \text{ mi/h} = 462 \text{ ft/s} \longrightarrow$$



$$v_r = 462\cos\theta = 369.6 \text{ ft/s}$$

$$v_\theta = -462\sin\theta = -277.2 \text{ ft/s}$$

$$v_r = \dot{r}$$

$\dot{r} = 370$ ft/s ◀

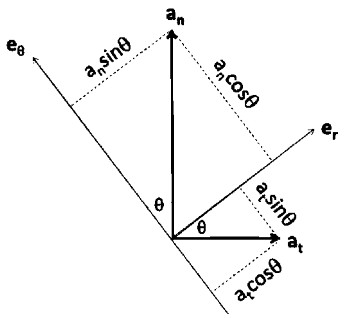
$$v_\theta = r\dot{\theta} \qquad \dot{\theta} = \frac{v_\theta}{r} = -\frac{277.2}{3000}$$

$\dot{\theta} = -0.0924$ rad/s ◀

Acceleration analysis.

$$a_t = 10 \text{ ft/s}^2$$

$$a_n = \frac{v^2}{\rho} = \frac{(462)^2}{5280} = 40.425 \text{ ft/s}^2$$



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.170

Pin C is attached to rod BC and slides freely in the slot of rod OA which rotates at the constant rate ω. At the instant when $\beta = 60°$, determine (*a*) $\dot{r}$ and $\dot{\theta}$, (*b*) $\ddot{r}$ and $\ddot{\theta}$. Express your answers in terms of d and ω.

SOLUTION

Looking at d and β as polar coordinates with $\dot{d} = 0$,

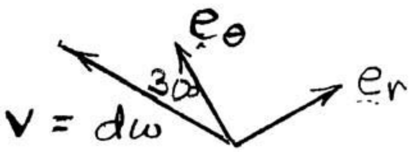
$$v_\beta = d\dot{\beta} = d\omega, \qquad v_d = \dot{d} = 0$$

$$a_\beta = d\ddot{\beta} + 2\dot{d}\dot{\beta} = 0, \qquad a_d = \ddot{d} - d\dot{\beta}^2 = -d\omega^2$$

Geometry analysis: $\quad r = d\sqrt{3}$ for angles shown.

(*a*) Velocity analysis:

Sketch the directions of $\mathbf{v}$, $\mathbf{e}_r$ and $\mathbf{e}_\theta$.



$$v_r = \dot{r} = \mathbf{v} \cdot \mathbf{e}_r = d\omega\cos 120°$$

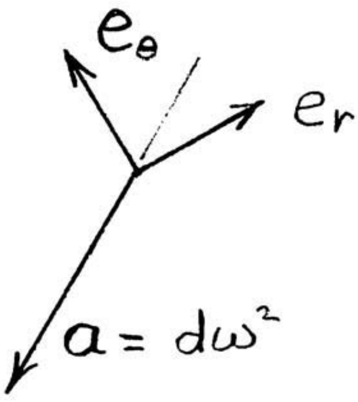
$$\dot{r} = -\frac{1}{2}d\omega \blacktriangleleft$$

$$v_\theta = r\dot{\theta} = \mathbf{v} \cdot \mathbf{e}_\theta = d\omega\cos 30°$$

$$\dot{\theta} = \frac{d\omega\cos 30°}{r} = \frac{d\omega\frac{\sqrt{3}}{2}}{d\sqrt{3}} \qquad \dot{\theta} = \frac{1}{2}\omega \blacktriangleleft$$

(*b*) Acceleration analysis:

Sketch the directions of $\mathbf{a}$, $\mathbf{e}_r$ and $\mathbf{e}_\theta$.



$$a_r = \mathbf{a} \cdot \mathbf{e}_r = a\cos 150° = -\frac{\sqrt{3}}{2}d\omega^2$$

$$\ddot{r} - r\dot{\theta}^2 = -\frac{\sqrt{3}}{2}d\omega^2$$

$$\ddot{r} = -\frac{\sqrt{3}}{2}d\omega^2 + r\dot{\theta}^2 = -\frac{\sqrt{3}}{2}d\omega^2 + d\sqrt{3}\left(\frac{1}{2}\omega\right)^2$$

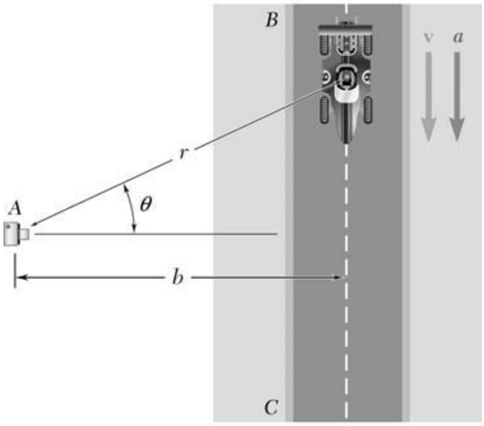
$$\ddot{r} = -\frac{\sqrt{3}}{4}d\omega^2 \blacktriangleleft$$

$$a_\theta = \mathbf{a} \cdot \mathbf{e}_\theta = d\omega^2\cos 120° = -\frac{1}{2}d\omega^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

$$\ddot{\theta} = \frac{1}{r}(a_\theta - 2\dot{r}\dot{\theta}) = \frac{1}{\sqrt{3}d}\left[-\frac{1}{2}d\omega^2 - (2)\left(-\frac{1}{2}d\omega\right)\left(\frac{1}{2}\omega\right)\right] \qquad \ddot{\theta} = 0 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



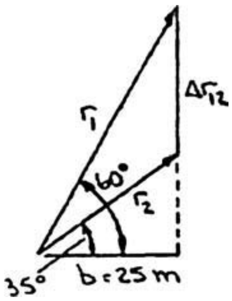
PROBLEM 11.171

For the racecar of Problem 11.167, it was found that it took 0.5 s for the car to travel from the position $\theta = 60°$ to the position $\theta = 35°$. Knowing that $b = 25$ m, determine the average speed of the car during the 0.5-s interval.

PROBLEM 11.167 To study the performance of a racecar, a high-speed camera is positioned at Point A. The camera is mounted on a mechanism which permits it to record the motion of the car as the car travels on straightway BC. Determine (a) the speed of the car in terms of b, θ, and $\dot{\theta}$, (b) the magnitude of the acceleration in terms of b, θ, $\dot{\theta}$, and $\ddot{\theta}$.

SOLUTION

From the diagram:



$$\Delta r_{12} = 25 \tan 60° - 25 \tan 35°$$
$$= 25.796 \text{ m}$$

Now

$$v_{\text{ave}} = \frac{\Delta r_{12}}{\Delta t_{12}}$$
$$= \frac{25.796 \text{ m}}{0.5 \text{ s}}$$
$$= 51.592 \text{ m/s}$$

or

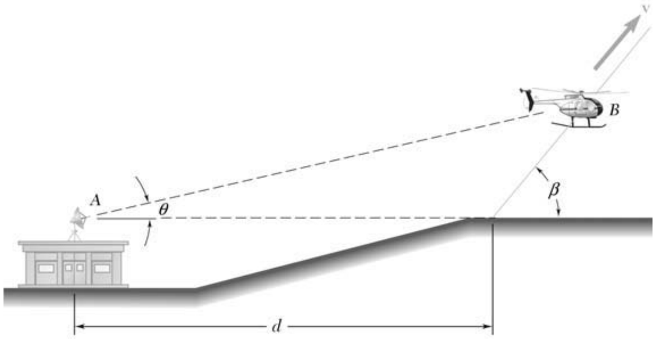
$$v_{\text{ave}} = 185.7 \text{ km/h} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

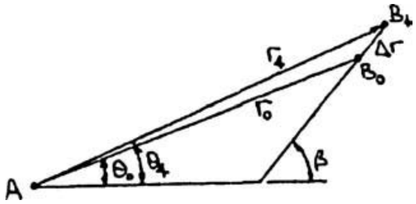
PROBLEM 11.172

For the helicopter of Problem 11.168, it was found that when the helicopter was at B, the distance and the angle of elevation of the helicopter were $r = 3000$ ft and $\theta = 20°$, respectively. Four seconds later, the radar station sighted the helicopter at $r = 3320$ ft and $\theta = 23.1°$. Determine the average speed and the angle of climb β of the helicopter during the 4-s interval.

PROBLEM 11.168 After taking off, a helicopter climbs in a straight line at a constant angle β. Its flight is tracked by radar from Point A. Determine the speed of the helicopter in terms of d, β, θ, and $\dot{\theta}$.



SOLUTION



We have $r_0 = 3000$ ft $\quad \theta_0 = 20°$

$r_4 = 3320$ ft $\quad \theta_4 = 23.1°$

From the diagram:

$$\Delta r^2 = 3000^2 + 3320^2 - 2(3000)(3320)\cos(23.1° - 20°)$$

or $\quad \Delta r = 362.70$ ft

Now
$$v_{ave} = \frac{\Delta r}{\Delta t} = \frac{362.70 \text{ ft}}{4 \text{ s}} = 90.675 \text{ ft/s}$$

or $\quad v_{ave} = 61.8$ mi/h ◀

Also, $\quad \Delta r \cos\beta = r_4 \cos\theta_4 - r_0 \cos\theta_0$

or
$$\cos\beta = \frac{3320\cos 23.1° - 3000\cos 20°}{362.70}$$

or $\quad \beta = 49.7°$ ◀

Logarithmic spiral $r = e^{b\theta}$

PROBLEM 11.174

A particle moves along the spiral shown; determine the magnitude of the velocity of the particle in terms of b, θ, and $\dot{\theta}$.

SOLUTION

Logarithmic spiral.

$$r = e^{b\theta}$$

$$\dot{r} = \frac{dr}{dt} = be^{b\theta}\frac{d\theta}{dt} = be^{b\theta}\dot{\theta}$$

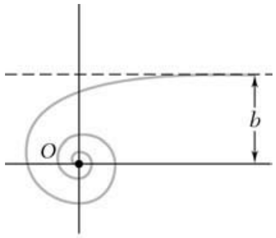
$$v_r = \dot{r} = be^{b\theta}\dot{\theta} \quad v_\theta = r\dot{\theta} = e^{b\theta}\dot{\theta}$$

$$v = \sqrt{v_r^2 + v_\theta^2} = e^{b\theta}\dot{\theta}\sqrt{b^2+1}$$

$$v = e^{b\theta}\sqrt{1+b^2}\ \dot{\theta} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.175



Hyperbolic spiral $r\theta = b$

A particle moves along the spiral shown. Knowing that $\dot{\theta}$ is constant and denoting this constant by ω, determine the magnitude of the acceleration of the particle in terms of b, θ, and ω.

SOLUTION

Hyperbolic spiral. $$r = \frac{b}{\theta}$$

From Problem 11.173 $$\dot{r} = -\frac{b}{\theta^2}\,\dot{\theta}$$

$$\ddot{r} = -\frac{b}{\theta^2}\ddot{\theta} + \frac{2b}{\theta^3}\dot{\theta}^2$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = -\frac{b}{\theta^2}\ddot{\theta} + \frac{2b}{\theta^3}\dot{\theta}^2 - \frac{b}{\theta}\dot{\theta}^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = \frac{b}{\theta}\ddot{\theta} + 2\left(-\frac{b}{\theta^2}\dot{\theta}\right)\dot{\theta} = \frac{b}{\theta}\ddot{\theta} - 2\frac{b}{\theta^2}\dot{\theta}^2$$

Since $\dot{\theta} = \omega = \text{constant}$, $\ddot{\theta} = 0$, and we write:

$$a_r = +\frac{2b}{\theta^3}\omega^2 - \frac{b}{\theta}\omega^2 = \frac{b\omega^2}{\theta^3}(2 - \theta^2)$$

$$a_\theta = -2\frac{b}{\theta^2}\omega^2 = -\frac{b\omega^2}{\theta^3}(2\theta)$$

$$a = \sqrt{a_r^2 + a_\theta^2} = \frac{b\omega^2}{\theta^3}\sqrt{(2-\theta^2)^2 + (2\theta)^2} = \frac{b\omega^2}{\theta^3}\sqrt{4 - 4\theta^2 + \theta^4 + 4\theta^2}$$

$$a = \frac{b\omega^2}{\theta^3}\sqrt{4 + \theta^4} \quad \blacktriangleleft$$

Logarithmic spiral $r = e^{b\theta}$

PROBLEM 11.176

A particle moves along the spiral shown. Knowing that $\dot{\theta}$ is constant and denoting this constant by ω, determine the magnitude of the acceleration of the particle in terms of b, θ, and ω.

SOLUTION

Logarithmic spiral.

$$r = e^{b\theta}$$

$$\dot{r} = \frac{dr}{dt} = be^{b\theta}\dot{\theta}$$

$$\ddot{r} = be^{b\theta}\ddot{\theta} + b^2 e^{b\theta}\dot{\theta}^2 = be^{b\theta}(\ddot{\theta} + b\dot{\theta}^2)$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = be^{b\theta}(\ddot{\theta} + b\dot{\theta}^2) - e^{b\theta}\dot{\theta}^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = e^{b\theta}\ddot{\theta} + 2(be^{b\theta}\dot{\theta})\dot{\theta}$$

Since $\dot{\theta} = \omega =$ constant, $\ddot{\theta} = \theta$, and we write

$$a_r = be^{b\theta}(b\omega^2) - e^{b\theta}\omega^2 = e^{b\theta}(b^2 - 1)\omega^2$$

$$a_\theta = 2be^{b\theta}\omega^2$$

$$a = \sqrt{a_r^2 + a_\theta^2} = e^{b\theta}\omega^2\sqrt{(b^2-1)^2 + (2b)^2}$$

$$= e^{b\theta}\omega^2\sqrt{b^4 - 2b^2 + 1 + 4b^2} = e^{b\theta}\omega^2\sqrt{b^4 + 2b^2 + 1}$$

$$= e^{b\theta}\omega^2\sqrt{(b^2+1)^2} = e^{b\theta}\omega^2(b^2+1)$$

$$a = (1 + b^2)\omega^2 e^{b\theta} \blacktriangleleft$$

PROBLEM 11.177

The motion of a particle on the surface of a right circular cylinder is defined by the relations $R = A$, $\theta = 2\pi t$, and $z = B\sin 2\pi nt$, where A and B are constants and n is an integer. Determine the magnitudes of the velocity and acceleration of the particle at any time t.

SOLUTION

$$R = A \qquad \theta = 2\pi t \qquad z = B\sin 2\pi nt$$
$$\dot{R} = 0 \qquad \dot{\theta} = 2\pi \qquad \dot{z} = 2\pi n\, B\cos 2\pi nt$$
$$\ddot{R} = 0 \qquad \ddot{\theta} = 0 \qquad \ddot{z} = -4\pi^2 n^2\, B\sin 2\pi nt$$

Velocity (Eq. 11.49)

$$\mathbf{v} = \dot{R}\mathbf{e}_R + R\dot{\theta}\mathbf{e}_\theta + \dot{z}\mathbf{k}$$
$$\mathbf{v} = \quad + A(2\pi)\mathbf{e}_\theta + 2\pi n\, B\cos 2\pi nt\,\mathbf{k}$$

$$v = 2\pi\sqrt{A^2 + n^2B^2\cos^2 2\pi nt} \quad ◀$$

Acceleration (Eq. 11.50)

$$\mathbf{a} = (\ddot{R} - R\dot{\theta}^2)\mathbf{e}_R + (R\ddot{\theta} + 2\dot{R}\dot{\theta})\mathbf{e}_\theta + \ddot{z}\mathbf{k}$$
$$\mathbf{a} = -4\pi^2 A\mathbf{e}_k - 4\pi^2 n^2\; B\sin 2\pi nt\,\mathbf{k}$$

$$a = 4\pi^2\sqrt{A^2 + n^4B^2\sin^2 2\pi nt} \quad ◀$$

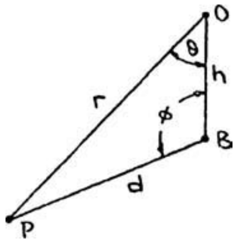
PROBLEM 11.178

Show that $\dot{r} = h\dot{\phi}\sin\theta$ knowing that at the instant shown, step AB of the step exerciser is rotating counterclockwise at a constant rate $\dot{\phi}$.

SOLUTION

From the diagram

$$r^2 = d^2 + h^2 - 2dh\cos\phi$$



Then $$2r\dot{r} = 2dh\dot{\phi}\sin\phi$$

Now $$\frac{r}{\sin\phi} = \frac{d}{\sin\theta}$$

or $$r = \frac{d\sin\phi}{\sin\theta}$$

Substituting for r in the expression for $\dot{r}$

$$\left(\frac{d\sin\phi}{\sin\theta}\right)\dot{r} = dh\dot{\phi}\sin\phi$$

or $$\dot{r} = h\dot{\phi}\sin\theta \qquad \text{Q.E.D.}$$ ◀

Alternative solution.

First note $$\alpha = 180° - (\phi + \theta)$$

Now $$\mathbf{v} = \mathbf{v}_r + \mathbf{v}_\theta = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$

With B as the origin

$$v_P = d\dot{\phi} \qquad (d = \text{constant} \Rightarrow \dot{d} = 0)$$

PROBLEM 11.179

The three-dimensional motion of a particle is defined by the relations $R = A(1-e^{-t}), \theta = 2\pi t,$ and $z = B(1-e^{-t})$. Determine the magnitudes of the velocity and acceleration when (*a*) $t = 0$, (*b*) $t = \infty$.

SOLUTION

$$R = A(1-e^{-t}) \qquad \theta = 2\pi t \qquad z = B(1-e^{-t})$$
$$\dot{R} = Ae^{-t} \qquad \dot{\theta} = 2\pi \qquad \dot{z} = Be^{-t}$$
$$\ddot{R} = -Ae^{-t} \qquad \ddot{\theta} = 0 \qquad \ddot{z} = -Be^{-t}$$

Velocity (Eq. 11.49)

$$\mathbf{v} = \dot{R}\mathbf{e}_R + R\dot{\theta}\mathbf{e}_\theta + \dot{z}\mathbf{k}$$
$$\mathbf{v} = Ae^{-t}\mathbf{e}_R + 2\pi A(1-e^{-t})\mathbf{e}_\theta + Be^{-t}\mathbf{k}$$

(*a*) When $t = 0$: $e^{-t} = e^0 = 1$; $\mathbf{v} = A\mathbf{e}_R + B\mathbf{k}$ $\qquad v = \sqrt{A^2 + B^2}$ ◀

(*b*) When $t = \infty$: $e^{-t} = e^{-\infty} = 0$ $\quad \mathbf{v} = 2\pi A\mathbf{e}_\theta$ $\qquad v = 2\pi A$ ◀

Acceleration (Eq. 11.50)

$$\mathbf{a} = (\ddot{R} - R\dot{\theta}^1)\mathbf{e}_R + (R\ddot{\theta} + 2\dot{R}\dot{\theta})\mathbf{e}_\theta + \ddot{z}\mathbf{k}$$
$$= [-Ae^{-t} - A(1-e^{-t})4\pi^2]\mathbf{e}_R + [0 + 2Ae^{-t}(2\pi)]\mathbf{e}_\theta - Be^{-t}\mathbf{k}$$

(*a*) When $t = 0$: $e^{-t} = e^0 = 1$

$$\mathbf{a} = -A\mathbf{e}_R + 4\pi A\mathbf{e}_\theta - B\,\mathbf{k}$$

$$a = \sqrt{A^2 + (4\pi A)^2 + B^2} \qquad a = \sqrt{(1+16\pi^2)A^2 + B^2} \text{ ◀}$$

(*b*) When $t = \infty$: $e^{-t} = e^{-\infty} = 0$

$$\mathbf{a} = -4\pi^2 A\mathbf{e}_R \qquad a = 4\pi^2 A \text{ ◀}$$

PROBLEM 11.180*

For the conic helix of Problem 11.95, determine the angle that the osculating plane forms with the y axis.

PROBLEM 11.95 The three-dimensional motion of a particle is defined by the position vector $\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$. Determine the magnitudes of the velocity and acceleration of the particle. (The space curve described by the particle is a conic helix.)

SOLUTION

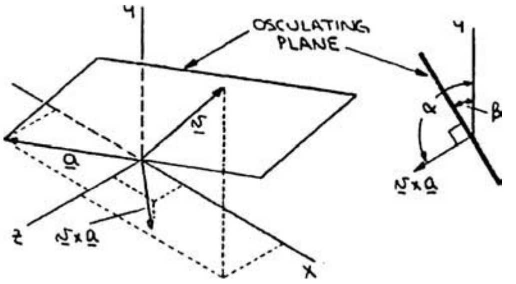
First note that the vectors **v** and **a** lie in the osculating plane.

Now $$\mathbf{r} = (Rt\cos\omega_n t)\mathbf{i} + ct\mathbf{j} + (Rt\sin\omega_n t)\mathbf{k}$$

Then $$\mathbf{v} = \frac{dr}{dt} = R(\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + c\mathbf{j} + R(\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}$$

and
$$\begin{aligned}\mathbf{a} &= \frac{dv}{dt}\\ &= R\left(-\omega_n\sin\omega_n t - \omega_n\sin\omega_n t - \omega_n^2 t\cos\omega_n t\right)\mathbf{i}\\ &\quad + R\left(\omega_n\cos\omega_n t + \omega_n\cos\omega_n t - \omega_n^2 t\sin\omega_n t\right)\mathbf{k}\\ &= \omega_n R[-(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{i} + (2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{k}]\end{aligned}$$

It then follows that the vector $(\mathbf{v}\times\mathbf{a})$ is perpendicular to the osculating plane.



$$(\mathbf{v}\times\mathbf{a}) = \omega_n R\begin{vmatrix}\mathbf{i} & \mathbf{j} & \mathbf{k}\\ R(\cos\omega_n t - \omega_n t\sin\omega_n t) & c & R(\sin\omega_n t + \omega_n t\cos\omega_n t)\\ -(2\sin\omega_n t + \omega_n t\cos\omega_n t) & 0 & (2\cos\omega_n t - \omega_n t\sin\omega_n t)\end{vmatrix}$$

$$\begin{aligned}&= \omega_n R\{c(2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} + R[-(\sin\omega_n t + \omega_n t\cos\omega_n t)(2\sin\omega_n t + \omega_n t\cos\omega_n t)\\ &\quad - (\cos\omega_n t - \omega_n t\sin\omega_n t)(2\cos\omega_n t - \omega_n t\sin\omega_n t)]\mathbf{j} + c(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}\\ &= \omega_n R\left[c(2\cos\omega_n t - \omega_n t\sin\omega_n t)\mathbf{i} - R\left(2 + \omega_n^2 t^2\right)\mathbf{j} + c(2\sin\omega_n t + \omega_n t\cos\omega_n t)\mathbf{k}\right]\end{aligned}$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.180* (Continued)

The angle α formed by the vector $(\mathbf{v}\times\mathbf{a})$ and the y axis is found from

$$\cos\alpha = \frac{(\mathbf{v}\times\mathbf{a})\cdot\mathbf{j}}{|(\mathbf{v}\times\mathbf{a})||\mathbf{j}|}$$

Where $$|\mathbf{j}| = 1$$

$$(\mathbf{v}\times\mathbf{a})\cdot\mathbf{j} = -\omega_n R^2\left(2+\omega_n^2 t^2\right)$$

$$|(\mathbf{v}\times\mathbf{a})| = \omega_n R\left[c^2(2\cos\omega_n t - \omega_n t\sin\omega_n t)^2 + R^2\left(2+\omega_n^2 t^2\right)^2 + c^2(2\sin\omega_n t + \omega_n t\cos\omega_n t)^2\right]^{1/2}$$

$$= \omega_n R\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}$$

Then $$\cos\alpha = \frac{-\omega_n R^2\left(2+\omega_n^2 t^2\right)}{\omega_n R\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}}$$

$$= \frac{-R\left(2+\omega_n^2 t^2\right)}{\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}}$$

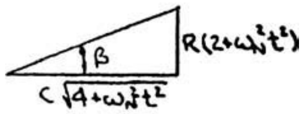
The angle β that the osculating plane forms with y axis (see the above diagram) is equal to

$$\beta = \alpha - 90°$$

Then $$\cos\alpha = \cos(\beta + 90°) = -\sin\beta$$

$$-\sin\beta = \frac{-R\left(2+\omega_n^2 t^2\right)}{\left[c^2\left(4+\omega_n^2 t^2\right) + R^2\left(2+\omega_n^2 t^2\right)^2\right]^{1/2}}$$

Then $$\tan\beta = \frac{R\left(2+\omega_n^2 t^2\right)}{c\sqrt{4+\omega_n^2 t^2}}$$



or $$\beta = \tan^{-1}\left[\frac{R\left(2+\omega_n^2 t^2\right)}{c\sqrt{4+\omega_n^2 t^2}}\right] \blacktriangleleft$$

PROBLEM 11.182

The motion of a particle is defined by the relation $x = 2t^3 - 15t^2 + 24t + 4,$ where x and t are expressed in meters and seconds, respectively. Determine (a) when the velocity is zero, (b) the position and the total distance traveled when the acceleration is zero.

SOLUTION

$$x = 2t^3 - 15t^2 + 24t + 4$$

so
$$v = \frac{dx}{dt} = 6t^2 - 30t + 24$$

$$a = \frac{dv}{dt} = 12t - 30$$

(a) Times when $v = 0$. $\quad 0 = 6t^2 - 30t + 24 = 6\,(t^2 - 5t + 4)$

$$(t-4)(t-1) = 0$$

$t = 1.00 \text{ s}, \quad t = 4.00 \text{ s}$ ◀

(b) Position and distance traveled when $a = 0$.

$$a = 12t - 30 = 0 \qquad t = 2.5 \text{ s}$$

so
$$x_2 = 2(2.5)^3 - 15(2.5)^2 + 24(2.5) + 4$$

Final position $\quad x = 1.50 \text{ m}$ ◀

For $\quad 0 \le t \le 1 \text{ s}, \quad v > 0.$

For $\quad 1 \text{ s} \le t \le 2.5 \text{ s}, \quad v \le 0.$

At $\quad t = 0, \quad x_0 = 4 \text{ m}.$

At $\quad t = 1 \text{ s}, \quad x_1 = (2)(1)^3 - (15)(1)^2 + (24)(1) + 4 = 15 \text{ m}$

Distance traveled over interval: $x_1 - x_0 = 11 \text{ m}$

For $\quad 1 \text{ s} \le t \le 2.5 \text{ s}, \qquad v \le 0$

Distance traveled over interval

$$|x_2 - x_1| = |1.5 - 15| = 13.5 \text{ m}$$

Total distance: $\quad d = 11 + 13.5$ $\qquad d = 24.5 \text{ m}$ ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.183

A particle starting from rest at $x = 1$ m is accelerated so that its velocity doubles in magnitude between $x = 2$ m and $x = 8$ m. Knowing that the acceleration of the particle is defined by the relation $a = k[x - (A/x)]$, determine the values of the constants A and k if the particle has a velocity of 29 m/s when $x = 16$ m.

SOLUTION

We have
$$v\frac{dv}{dx} = a = k\left(x - \frac{A}{x}\right)$$

When $x = 1$ ft, $v = 0$:
$$\int_0^v v\,dv = \int_1^x k\left(x - \frac{A}{x}\right)dx$$

or
$$\frac{1}{2}v^2 = k\left[\frac{1}{2}x^2 - A\ln x\right]_1^x$$
$$= k\left(\frac{1}{2}x^2 - A\ln x - \frac{1}{2}\right)$$

At $x = 2$ ft:
$$\frac{1}{2}v_2^2 = k\left[\frac{1}{2}(2)^2 - A\ln 2 - \frac{1}{2}\right] = k\left(\frac{3}{2} - A\ln 2\right)$$

$x = 8$ ft:
$$\frac{1}{2}v_8^2 = k\left[\frac{1}{2}(8)^2 - A\ln 8 - \frac{1}{2}\right] = k(31.5 - A\ln 8)$$

Now $\frac{v_8}{v_2} = 2$:
$$\frac{\frac{1}{2}v_8^2}{\frac{1}{2}v_2^2} = (2)^2 = \frac{k(31.5 - A\ln 8)}{k\left(\frac{3}{2} - A\ln 2\right)}$$

$$6 - 4A\ln 2 = 31.5 - A\ln 8$$

$$25.5 = A(\ln 8 - 4\ln 2) = A(\ln 8 - \ln 2^4) = A\ln\left(\frac{1}{2}\right)$$

$$A = \frac{25.5}{\ln\frac{1}{2}}$$
$A = -36.8\ \text{m}^2$ ◀

When $x = 16$ m, $v = 29$ m/s:
$$\frac{1}{2}(29)^2 = k\left[\frac{1}{2}(16)^2 - \frac{25.5}{\ln\left(\frac{1}{2}\right)}\ln(16) - \frac{1}{2}\right]$$

$$420.5k = k\left[128 + 102 - \frac{1}{2}\right] = 230.5k$$
$$= 230.5k$$
$k = 1.832\ \text{s}^{-2}$ ◀

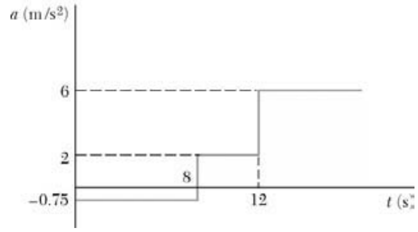
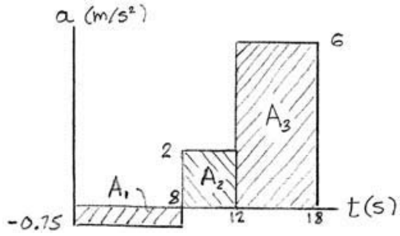
PROBLEM 11.184



A particle moves in a straight line with the acceleration shown in the figure. Knowing that the particle starts from the origin with $v_0 = -2$ m/s, (*a*) construct the $v{-}t$ and $x{-}t$ curves for $0 < t < 18$ s, (*b*) determine the position and the velocity of the particle and the total distance traveled when $t = 18$ s.

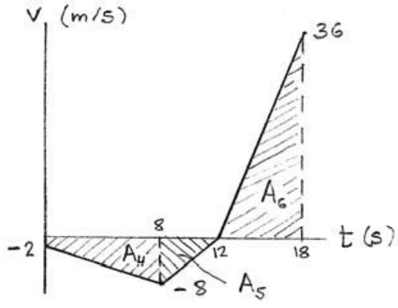
SOLUTION

Compute areas under $a - t$ curve.



$$A_1 = (-0.75)(8) = -6 \text{ m/s}$$
$$A_2 = (2)(4) = 8 \text{ m/s}$$
$$A_3 = (6)(6) = 36 \text{ m/s}$$

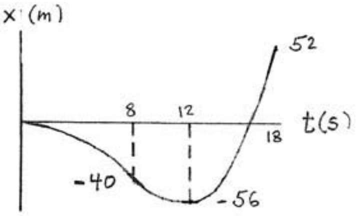
$$v_0 = -2 \text{ m/s}$$
$$v_8 = v_0 + A_1 = -8 \text{ m/s}$$
$$v_{12} = v_8 + A_2 = 0$$
$$v_{18} = v_{12} + A_3 \qquad v_{18} = 36 \text{ m/s} \blacktriangleleft$$



Sketch $v{-}t$ curve using straight line portions over the constant acceleration periods.

Compute areas under the $v{-}t$ curve.

$$A_4 = \frac{1}{2}(-2 - 8)(8) = -40 \text{ m}$$
$$A_5 = \frac{1}{2}(-8)(4) = -16 \text{ m}$$
$$A_6 = \frac{1}{2}(36)(6) = 108 \text{ m}$$



$$x_0 = 0$$
$$x_8 = x_0 + A_4 = -40 \text{ m}$$
$$x_{12} = x_8 + A_5 = -56 \text{ m}$$
$$x_{18} = x_{12} + A_6 \qquad x_{18} = 52 \text{ m} \blacktriangleleft$$

Total distance traveled $= 56 + 108$ $\qquad d = 164 \text{ m} \blacktriangleleft$

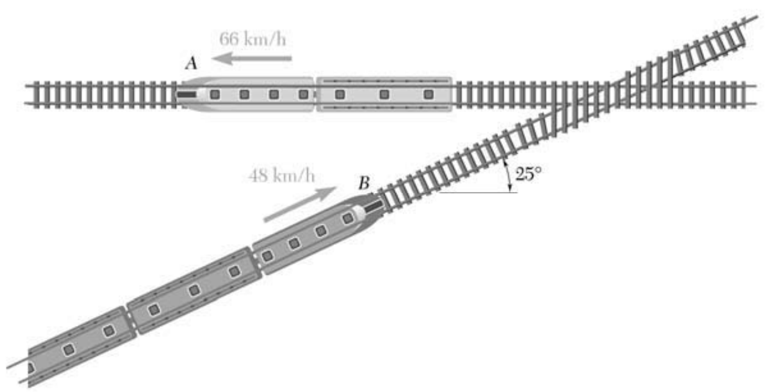
PROBLEM 11.185

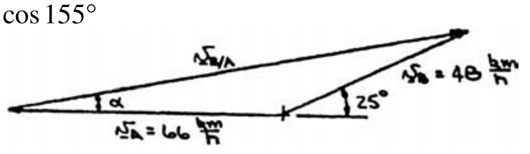


The velocities of commuter trains A and B are as shown. Knowing that the speed of each train is constant and that B reaches the crossing 10 min after A passed through the same crossing, determine (a) the relative velocity of B with respect to A, (b) the distance between the fronts of the engines 3 min after A passed through the crossing.

SOLUTION

(a) We have $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

The graphical representation of this equation is then as shown.



Then $v_{B/A}^2 = 66^2 + 48^2 - 2(66)(48)\cos 155°$

or $v_{B/A} = 111.366 \text{ km/h}$

and $\dfrac{48}{\sin\alpha} = \dfrac{111.366}{\sin 155°}$

or $\alpha = 10.50°$

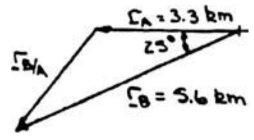
$\mathbf{v}_{B/A} = 111.4 \text{ km/h} \measuredangle\ 10.50°$ ◀

(b) First note that

at $t = 3$ min, A is $(66 \text{ km/h})\left(\frac{3}{60}\right) = 3.3$ km west of the crossing.

at $t = 3$ min, B is $(48 \text{ km/h})\left(\frac{7}{60}\right) = 5.6$ km southwest of the crossing.

Now $\mathbf{r}_B = \mathbf{r}_A + \mathbf{r}_{B/A}$



Then at $t = 3$ min, we have

$$r_{B/A}^2 = 3.3^2 + 5.6^2 - 2(3.3)(5.6)\cos 25°$$

or $r_{B/A} = 2.96 \text{ km}$ ◀

PROBLEM 11.186

Slider block B starts from rest and moves to the right with a constant acceleration of $1\,\text{ft/s}^2$. Determine (a) the relative acceleration of portion C of the cable with respect to slider block A, (b) the velocity of portion C of the cable after 2 s.

SOLUTION

Let d be the distance between the left and right supports.

Constraint of entire cable: $x_B + (x_B - x_A) + 2(d - x_A) = \text{constant}$

$$2v_B - 3v_A = 0 \qquad \text{and} \qquad 2a_B - 3a_A = 0$$

$$a_A = \frac{2}{3}a_B = \frac{2}{3}(1) = 0.667\ \text{ft/s}^2 \qquad \text{or} \qquad a_A = 0.667\ \text{ft/s}^2 \longrightarrow$$

Constraint of Point C: $\quad 2(d - x_A) + y_{C/A} = \text{constant}$

$$-2v_A + v_{C/A} = 0 \qquad \text{and} \qquad -2a_A + a_{C/A} = 0$$

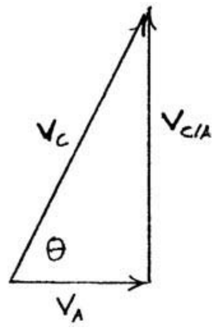
(a) $\quad a_{C/A} = 2a_A = 2(0.667) = 1.333\ \text{ft/s}^2$

$$\mathbf{a}_{C/A} = 1.333\ \text{ft/s}^2 \uparrow \blacktriangleleft$$

Velocity vectors after 2s: $\mathbf{v}_A = (0.667)(2) = 1.333\ \text{ft/s} \longrightarrow$

$$\mathbf{v}_{C/A} = (1.333)(2) = 2.666\ \text{ft/s} \uparrow$$

$$\mathbf{v}_C = \mathbf{v}_A + \mathbf{v}_{C/A}$$



Sketch the vector addition.

$$v_C^2 = v_A^2 + v_{C/A}^2 = (1.333)^2 + (2.666)^2 = 8.8889(\text{ft/s})^2$$

$$v_C = 2.981\ \text{ft/s}$$

$$\tan\theta = \frac{v_{C/A}}{v_A} = \frac{2.666}{1.333} = 2, \qquad \theta = 63.4^\circ$$

(b) $\quad \mathbf{v}_C = 2.98\ \text{ft/s} \measuredangle\ 63.4^\circ \blacktriangleleft$

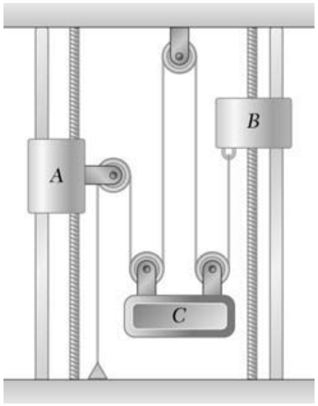
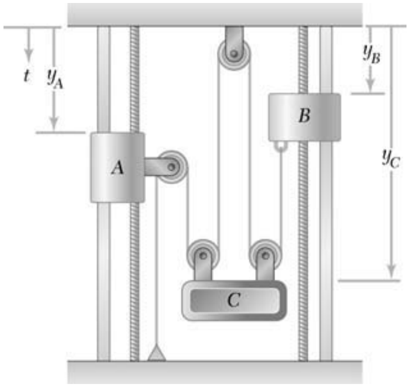
PROBLEM 11.187



Collar A starts from rest at $t = 0$ and moves downward with a constant acceleration of 7 in./s^2. Collar B moves upward with a constant acceleration, and its initial velocity is 8 in./s. Knowing that collar B moves through 20 in. between $t = 0$ and $t = 2$ s, determine (a) the accelerations of collar B and block C, (b) the time at which the velocity of block C is zero, (c) the distance through which block C will have moved at that time.

SOLUTION



From the diagram

$$-y_A + (y_C - y_A) + 2y_C + (y_C - y_B) = \text{constant}$$

Then $\qquad -2v_A - v_B + 4v_C = 0 \qquad (1)$

and $\qquad -2a_A - a_B + 4a_C = 0 \qquad (2)$

Given: $\qquad (v_A)_0 = 0$

$$(\mathbf{a}_A) = 7 \text{ in./s}^2 \downarrow$$

$$(\mathbf{v}_B)_0 = 8 \text{ in./s} \uparrow$$

$$\mathbf{a}_B = \text{constant} \uparrow$$

At $t = 2$ s $\qquad y - (y_B)_0 = 20 \text{ in.} \uparrow$

(a) We have $\qquad y_B = (y_B)_0 + (v_B)_0 t + \frac{1}{2} a_B t^2$

At $t = 2$ s: $\qquad -20 \text{ in.} = (-8 \text{ in./s})(2 \text{ s}) + \frac{1}{2} a_B (2 \text{ s})^2$

$$a_B = -4 \text{ in./s}^2 \quad \text{or} \quad \mathbf{a}_B = 2 \text{ in./s}^2 \uparrow \blacktriangleleft$$

Then, substituting into Eq. (2)

$$-2(7 \text{ in./s}^2) - (-2 \text{ in./s}^2) + 4a_C = 0$$

$$a_C = 3 \text{ in./s}^2 \quad \text{or} \quad \mathbf{a}_C = 3 \text{ in./s}^2 \downarrow \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.187 (Continued)

(*b*) Substituting into Eq. (1) at $t = 0$

$$-2(0) - (-8 \text{ in./s}) + 4(v_C)_0 = 0 \quad \text{or} \quad (v_C)_0 = -2 \text{ in./s}$$

Now
$$v_C = (v_C)_0 + a_C t$$

When $v_C = 0$:
$$0 = (-2 \text{ in./s}) + (3 \text{ in./s}^2)t$$

or
$$t = \frac{2}{3} \text{ s}$$

$t = 0.667$ s ◀

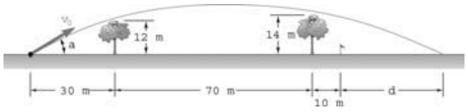
(*c*) We have
$$y_C = (y_C)_0 + (v_C)_0 t + \frac{1}{2} a_C t^2$$

At $t = \frac{2}{3}$ s:
$$y_C - (y_C)_0 = (-2 \text{ in./s})\left(\frac{2}{3} \text{ s}\right) + \frac{1}{2}(3 \text{ in./s}^2)\left(\frac{2}{3} \text{ s}\right)^2$$

$$= -0.667 \text{ in.} \qquad \text{or} \qquad \mathbf{y}_C - (\mathbf{y}_C)_0 = 0.667 \text{ in.}\uparrow$$ ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.188



A golfer hits a ball with an initial velocity of magnitude v_0 at an angle α with the horizontal. Knowing that the ball must clear the tops of two trees and land as close as possible to the flag, determine v_0 and the distance d when the golfer uses (*a*) a six-iron with $\alpha = 31°$, (*b*) a five-iron with $\alpha = 27°$.

SOLUTION

The horizontal and vertical motions are

$$x = (v_0 \cos\alpha)t \qquad \text{or} \qquad v_0 = \frac{x}{t\cos\alpha} \tag{1}$$

$$y = (v_0 \sin\alpha)t - \frac{1}{2}gt^2 = x\tan\alpha - \frac{1}{2}gt^2$$

or $$t^2 = \frac{2(x\tan\alpha - y)}{g} \tag{2}$$

At the landing Point C: $$y_C = 0, \qquad t = \frac{2v_0 \sin\alpha}{g}$$

And $$x_C = (v_0\cos\alpha)t = \frac{2v_0^2 \sin\alpha\cos\alpha}{g} \tag{3}$$

(*a*) $\alpha = 31°$

To clear tree A: $x_A = 30$ m, $y_A = 12$ m

From (2), $$t_A^2 = \frac{2(30\tan 31° - 12)}{9.81} = 1.22851 \text{ s}^2, \qquad t_A = 1.1084 \text{ s}$$

From (1), $$(v_0)_A = \frac{30}{1.1084\cos 31°} = 31.58 \text{ m/s}$$

To clear tree B: $x_B = 100$ m, $y_B = 14$ m

From (2), $$(t_B)^2 = \frac{2(100\tan 31° - 14)}{9.81} = 9.3957 \text{ s}^2, \qquad t_B = 3.0652 \text{ s}$$

From (1), $$(v_0)_B = \frac{100}{3.0652\cos 31°} = 38.06 \text{ m/s}$$

The larger value governs, $v_0 = 38.06$ m/s $\qquad$ $v_0 = 38.1$ m/s ◀

From (3), $$x_C = \frac{(2)(38.06)^2 \sin 31° \cos 31°}{9.81} = 130.38 \text{ m}$$

$d = x_C - 110$ $\qquad$ $d = 20.4$ m ◀

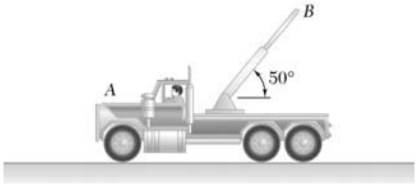
PROBLEM 11.189



As the truck shown begins to back up with a constant acceleration of 4 ft/s^2, the outer section B of its boom starts to retract with a constant acceleration of 1.6 ft/s^2 relative to the truck. Determine (*a*) the acceleration of section B, (*b*) the velocity of section B when $t = 2$ s.

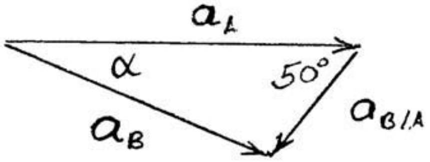
SOLUTION

For the truck, $\mathbf{a}_A = 4 \text{ ft/s}^2 \longrightarrow$

For the boom, $\mathbf{a}_{B/A} = 1.6 \text{ ft/s}^2 \swarrow 50°$

(*a*) $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$

Sketch the vector addition.



By law of cosines:

$$a_B^2 = a_A^2 + a_{B/A}^2 - 2a_A a_{B/A} \cos 50°$$

$$= 4^2 + 1.6^2 - 2(4)(1.6)\cos 50°$$

$$a_B = 3.214 \text{ ft/s}^2$$

Law of sines: $\sin\alpha = \dfrac{a_{B/A}\sin 50°}{a_B} = \dfrac{1.6\sin 50°}{3.214} = 0.38131$

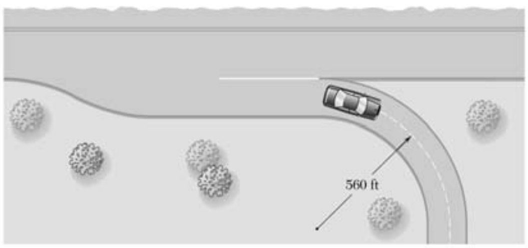
$\alpha = 22.4°$, $\quad \mathbf{a}_B = 3.21 \text{ ft/s}^2 \searrow 22.4°$ ◀

(*b*) $\mathbf{v}_B = (v_B)_0 + a_B t = 0 + (3.214)(2)$

$\mathbf{v}_B = 6.43 \text{ ft/s}^2 \searrow 22.4°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.190



A motorist traveling along a straight portion of a highway is decreasing the speed of his automobile at a constant rate before exiting from the highway onto a circular exit ramp with a radius of 560-ft. He continues to decelerate at the same constant rate so that 10 s after entering the ramp, his speed has decreased to 20 mi/h, a speed which he then maintains. Knowing that at this constant speed the total acceleration of the automobile is equal to one-quarter of its value prior to entering the ramp, determine the maximum value of the total acceleration of the automobile.

SOLUTION

First note $$v_{10} = 20 \text{ mi/h} = \frac{88}{3} \text{ ft/s}$$

While the car is on the straight portion of the highway.

$$a = a_{\text{straight}} = a_t$$

and for the circular exit ramp

$$a = \sqrt{a_t^2 + a_n^2}$$

where $$a_n = \frac{v^2}{\rho}$$

By observation, $a_{\max}$ occurs when v is maximum, which is at $t = 0$ when the car first enters the ramp.

For uniformly decelerated motion

$$v = v_0 + a_t t$$

and at $t = 10$ s: $$v = \text{constant} \Rightarrow a = a_n = \frac{v_{10}^2}{\rho}$$

$$a = \frac{1}{4} a_{\text{st.}}$$

Then $$a_{\text{straight}} = a_t \Rightarrow \frac{1}{4} a_t = \frac{v_{10}^2}{\rho} = \frac{\left(\frac{88}{3} \text{ ft/s}\right)^2}{560 \text{ ft}}$$

or $$a_t = -6.1460 \text{ ft/s}^2$$

(The car is decelerating; hence the minus sign.)

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 11.191

Sand is discharged at A from a conveyor belt and falls onto the top of a stockpile at B. Knowing that the conveyor belt forms an angle $\alpha = 25°$ with the horizontal, determine (a) the speed v_0 of the belt, (b) the radius of curvature of the trajectory described by the sand at Point B.

SOLUTION

The motion is projectile motion. Place the origin at Point A. Then $x_0 = 0$ and $y_0 = 0$.
The coordinates of Point B are $x_B = 30$ ft and $y_B = -18$ ft.

Horizontal motion: $v_x = v_0 \cos 25°$ (1)

$x = v_0 t \cos 25°$ (2)

Vertical motion: $v_y = v_0 \sin 25° - gt$ (3)

$y = v_0 t \sin 25° - \frac{1}{2} g t^2$ (4)

At Point B, Eq. (2) gives

$$v_0 t_B = \frac{x_B}{\cos 25°} = \frac{30}{\cos 25°} = 33.101 \text{ ft}$$

Substituting into Eq. (4),

$$-18 = (33.101)(\sin 25°) - \frac{1}{2}(32.2)t_B^2$$

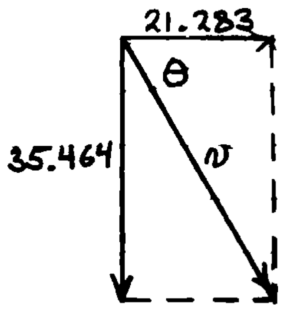
$$t_B = 1.40958 \text{ s}$$

(a) Speed of the belt.

$$v_0 = \frac{v_0 t_B}{t_B} = \frac{33.101}{1.40958} = 23.483$$

$v_0 = 23.4$ ft/s ◀

Eqs. (1) and (3) give



$$v_x = 23.483 \cos 25° = 21.283 \text{ ft/s}$$

$$v_y = (23.483)\sin 25° - (32.2)(1.40958) = -35.464 \text{ ft/s}$$

$$\tan\theta \frac{-v_y}{v_x} = 1.66632 \qquad \theta = 59.03°$$

$$v = 41.36 \text{ ft/s}$$

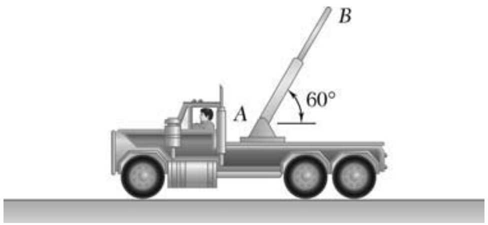
PROBLEM 11.192



The end Point B of a boom is originally 5 m from fixed Point A when the driver starts to retract the boom with a constant radial acceleration of $\ddot{r} = -1.0\ \text{m/s}^2$ and lower it with a constant angular acceleration $\ddot{\theta} = -0.5\ \text{rad/s}^2$. At $t = 2$ s, determine (a) the velocity of Point B, (b) the acceleration of Point B, (c) the radius of curvature of the path.

SOLUTION

Radial motion. $\quad r_0 = 5\ \text{m}, \quad \dot{r}_0 = 0, \quad \ddot{r} = -1.0\ \text{m/s}^2$

$$r = r_0 + \dot{r}_0 t + \frac{1}{2}\ddot{r}t^2 = 5 + 0 - 0.5t^2$$

$$\dot{r} = \dot{r}_0 + \ddot{r}t = 0 - 1.0t$$

At $t = 2$ s, $\quad r = 5 - (0.5)(2)^2 = 3\ \text{m}$

$$\dot{r} = (-1.0)(2) = -2\ \text{m/s}$$

Angular motion. $\quad \theta_0 = 60° = \frac{\pi}{3}\text{rad}, \quad \dot{\theta}_0 = 0, \quad \ddot{\theta} = -0.5\ \text{rad/s}^2$

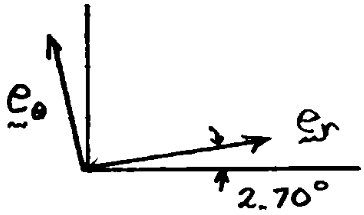
$$\theta = \theta_0 + \dot{\theta}_0 + \frac{1}{2}\ddot{\theta}t^2 = \frac{\pi}{3} + 0 - 0.25t^2$$

$$\dot{\theta} = \dot{\theta}_0 + \ddot{\theta}t = 0 - 0.5t$$

At $t = 2$ s, $\quad \theta = \frac{\pi}{3} + 0 - (0.25)(2)^2 = 0.047198\ \text{rad} = 2.70°$

$$\dot{\theta} = -(0.5)(2) = -1.0\ \text{rad/s}$$

Unit vectors $\mathbf{e}_r$ and $\mathbf{e}_\theta$.



(a) Velocity of Point B at $t = 2$ s.

$$\mathbf{v}_B = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$

$$= -(2\ \text{m/s})\mathbf{e}_r + (3\ \text{m})(-1.0\ \text{rad/s})\mathbf{e}_\theta$$

$$\mathbf{v}_B = (-2.00\ \text{m/s})\mathbf{e}_r + (-3.00\ \text{m/s})\mathbf{e}_\theta \blacktriangleleft$$

$$\tan\alpha = \frac{v_\theta}{v_r} = \frac{-3.0}{-2.0} = 1.5 \qquad \alpha = 56.31°$$

$$v = \sqrt{v_r^2 + v_\theta^2} = \sqrt{(-2)^2 + (-3)^2} = 3.6055\ \text{m/s}$$

PROBLEM 11.192 (Continued)

Direction of velocity.

$$\mathbf{e}_t = \frac{\mathbf{v}}{v} = \frac{-2\mathbf{e}_r - 3\mathbf{e}_\theta}{3.6055} = -0.55470\mathbf{e}_r - 0.83205\mathbf{e}_\theta$$

$$\theta + \alpha = 2.70 + 56.31° = 59.01°$$

$$\mathbf{v}_B = 3.61 \text{ m/s} \nearrow 59.0° \blacktriangleleft$$

(*b*) Acceleration of Point *B* at $t = 2$ s.

$$\mathbf{a}_B = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$
$$= [-1.0 - (3)(-1)^2]\mathbf{e}_r + [(3)(-0.5) + (2)(-1.0)(-0.5)]\mathbf{e}_\theta$$

$$\mathbf{a}_B = (-4.00 \text{ m/s}^2)\mathbf{e}_r + (2.50 \text{ m/s}^2)\mathbf{e}_\theta \blacktriangleleft$$

$$\tan\beta = \frac{a_\theta}{a_r} = \frac{2.50}{-4.00} = -0.625 \qquad \beta = -32.00°$$

$$a = \sqrt{a_r^2 + a_\theta^2} = \sqrt{(-4)^2 + (2.5)^2} = 4.7170 \text{ m/s}^2$$

$$\theta + \beta = 2.70° - 32.00° = -29.30°$$

$$\mathbf{a}_B = 4.72 \text{ m/s}^2 \nearrow 29.3° \blacktriangleleft$$

Tangential component: $\mathbf{a}_t = (\mathbf{a} \cdot \mathbf{e}_t)\mathbf{e}_t$

$$\mathbf{a}_t = (-4\mathbf{e}_r + 2.5\mathbf{e}_\theta) \cdot (-0.55470\mathbf{e}_r - 0.83205\mathbf{e}_\theta)\mathbf{e}_t$$
$$= [(-4)(-0.55470) + (2.5)(-0.83205)]\mathbf{e}_t$$

$$= (0.138675 \text{ m/s}^2)\mathbf{e}_t = 0.1389 \text{ m/s}^2 \nearrow 59.0°$$

Normal component: $\mathbf{a}_n = \mathbf{a} - \mathbf{a}_t$

$$\mathbf{a}_n = -4\mathbf{e}_r + 2.5\mathbf{e}_\theta - (0.138675)(-0.55470\mathbf{e}_r - 0.83205\mathbf{e}_\theta)$$
$$= (-3.9231 \text{ m/s}^2)\mathbf{e}_r + (2.6154 \text{ m/s}^2)\mathbf{e}_\theta$$

$$a_n = \sqrt{(3.9231)^2 + (2.6154)^2} = 4.7149 \text{ m/s}^2$$

(*c*) Radius of curvature of the path.

$$a_n = \frac{v^2}{\rho}$$

$$\rho = \frac{v^2}{a_n} = \frac{(3.6055 \text{ m/s})^2}{4.7149 \text{ m/s}} \qquad \rho = 2.76 \text{ m} \blacktriangleleft$$

PROBLEM 11.193

A telemetry system is used to quantify kinematic values of a ski jumper immediately before she leaves the ramp. According to the system $r = 500$ ft, $\dot{r} = -105$ ft/s, $\ddot{r} = -10$ ft/s^2, $\theta = 25°$, $\dot{\theta} = 0.07$ rad/s, $\ddot{\theta} = 0.06$ rad/s^2. Determine (*a*) the velocity of the skier immediately before she leaves the jump, (*b*) the acceleration of the skier at this instant, (*c*) the distance of the jump *d* neglecting lift and air resistance.

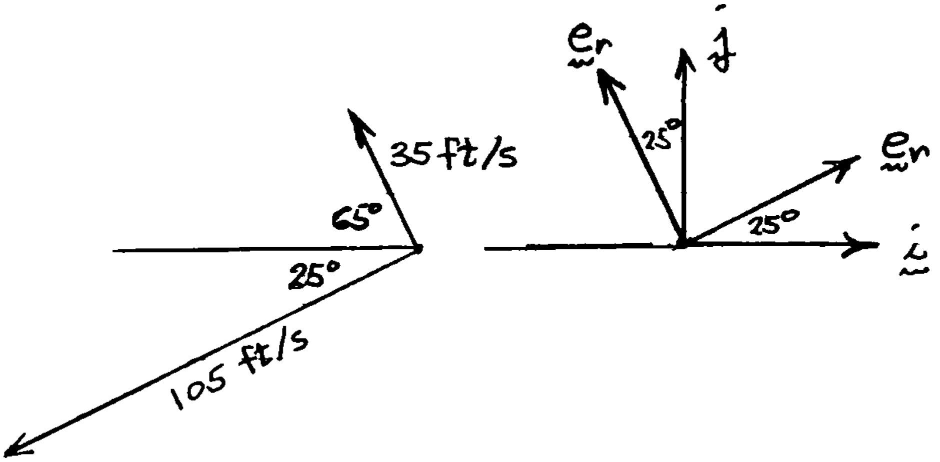
SOLUTION

(*a*) Velocity of the skier. ($r = 500$ ft, $\theta = 25°$)

$$\mathbf{v} = v_r\mathbf{e}_r + v_\theta\mathbf{e}_\theta = \dot{r}\mathbf{e}_r + r\dot{\theta}\mathbf{e}_\theta$$
$$= (-105 \text{ ft/s})\mathbf{e}_r + (500 \text{ ft})(0.07 \text{ rad/s})\mathbf{e}_\theta$$

$$\mathbf{v} = (-105 \text{ ft/s})\mathbf{e}_r + (35 \text{ ft/s})\mathbf{e}_\theta \blacktriangleleft$$

Direction of velocity:



$$\mathbf{v} = (-105\cos 25° - 35\cos 65°)\mathbf{i} + (35\sin 65° - 105\sin 25°)\mathbf{j}$$
$$= (-109.95 \text{ ft/s})\mathbf{i} + (-12.654 \text{ ft/s})\mathbf{j}$$

$$\tan\alpha = \frac{v_y}{v_x} = \frac{-12.654}{-109.95} \qquad \alpha = 6.565°$$

$$v = \sqrt{(105)^2 + (35)^2} = 110.68 \text{ ft/s}$$

$$v = 110.7 \text{ ft/s} \nearrow 6.57° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 11.193 (Continued)

(*b*) Acceleration of the skier.

$$\mathbf{a} = a_r\mathbf{e}_r + a_\theta\mathbf{e}_\theta = (\ddot{r} - r\dot{\theta}^2)\mathbf{e}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{e}_\theta$$

$$a_r = -10 - (500)(0.07)^2 = -12.45 \text{ ft/s}^2$$

$$a_\theta = (500)(0.06) + (2)(-105)(0.07) = 15.30 \text{ ft/s}^2$$

$$\mathbf{a} = (-12.45 \text{ ft/s}^2)\mathbf{e}_r + (15.30 \text{ ft/s}^2)\mathbf{e}_\theta \blacktriangleleft$$

$$\mathbf{a} = (-12.45)(\mathbf{i}\cos 25° + \mathbf{j}\sin 25°) + (15.30)(-\mathbf{i}\cos 65° + \mathbf{j}\sin 65°)$$

$$= (-17.750 \text{ ft/s}^2)\mathbf{i} + (8.6049 \text{ ft/s}^2)\mathbf{j}$$

$$\tan\beta = \frac{a_y}{a_x} = \frac{8.6049}{-17.750} \qquad \beta = -25.9°$$

$$a = \sqrt{(12.45)^2 + (15.30)^2} = 19.725 \text{ ft/s}^2$$

$$a = 19.73 \text{ ft/s}^2 \nearrow 25.9° \blacktriangleleft$$

(*c*) Distance of the jump *d*.

Projectile motion. Place the origin of the *xy*-coordinate system at the end of the ramp with the *x*-coordinate horizontal and positive to the left and the *y*-coordinate vertical and positive downward.

Horizontal motion: (Uniform motion)

$$x_0 = 0$$

$$\dot{x}_0 = 109.95 \text{ ft/s} \qquad \text{(from Part } a\text{)}$$

$$x = x_0 + \dot{x}_0 t = 109.95t$$

Vertical motion: (Uniformly accelerated motion)

$$y_0 = 0$$

$$\dot{y}_0 = 12.654 \text{ ft/s} \qquad \text{(from Part } a\text{)}$$

$$\ddot{y} = 32.2 \text{ ft/s}^2$$

$$y = y_0 + \dot{y}_0 t + \frac{1}{2}\ddot{y}t^2 = 12.654t - 16.1t^2$$

At the landing point,

$$x = d\cos 30° \qquad (1)$$

$$y = 10 + d\sin 30° \quad \text{or} \quad y - 10 = d\sin 30° \qquad (2)$$

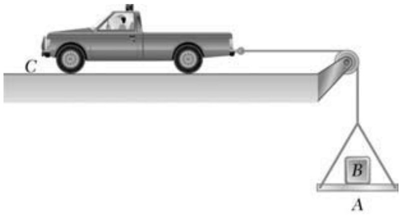
CHAPTER 12

PROBLEM 12.CQ1



A 1000 lb boulder *B* is resting on a 200 lb platform *A* when truck *C* accelerates to the left with a constant acceleration. Which of the following statements are true (more than one may be true)?

(*a*) The tension in the cord connected to the truck is 200 lb

(*b*) The tension in the cord connected to the truck is 1200 lb

(*c*) The tension in the cord connected to the truck is greater than 1200 lb

(*d*) The normal force between *A* and *B* is 1000 lb

(*e*) The normal force between *A* and *B* is 1200 lb

(*f*) None of the above

SOLUTION

Answer: (*c*) The tension will be greater than 1200 lb and the normal force will be greater than 1000 lb.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.CQ2

Marble A is placed in a hollow tube, and the tube is swung in a horizontal plane causing the marble to be thrown out. As viewed from the top, which of the following choices best describes the path of the marble after leaving the tube?

(*a*) 1

(*b*) 2

(*c*) 3

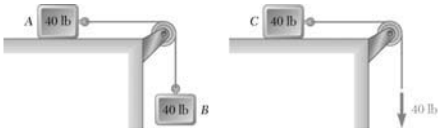
(*d*) 4

(*e*) 5

SOLUTION

Answer: (*d*) The particle will have velocity components along the tube and perpendicular to the tube. After it leaves, it will travel in a straight line.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.CQ3

The two systems shown start from rest. On the left, two 40 lb weights are connected by an inextensible cord, and on the right, a constant 40 lb force pulls on the cord. Neglecting all frictional forces, which of the following statements is true?

(*a*) Blocks *A* and *C* will have the same acceleration

(*b*) Block *C* will have a larger acceleration than block *A*

(*c*) Block *A* will have a larger acceleration than block *C*

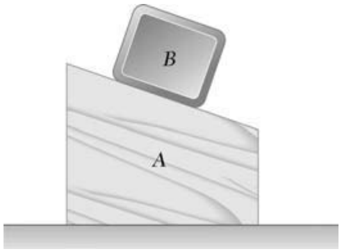
(*d*) Block *A* will not move

(*e*) None of the above

SOLUTION

Answer: (*b*) If you draw a FBD of *B*, you will see that since it is accelerating downward, the tension in the cable will be less than 40 lb, so the acceleration of *A* will be less than the acceleration of *C*. Also, the system on the left has more inertia, so it is harder to accelerate than the system on the right.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.CQ4

The system shown is released from rest in the position shown. Neglecting friction, the normal force between block *A* and the ground is

(*a*) less than the weight of *A* plus the weight of *B*

(*b*) equal to the weight of *A* plus the weight of *B*

(*c*) greater than the weight of *A* plus the weight of *B*

SOLUTION

Answer: (*a*) Since *B* has an acceleration component downward the normal force between *A* and the ground will be less than the sum of the weights.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 12.CQ5

People sit on a Ferris wheel at Points *A*, *B*, *C* and *D*. The Ferris wheel travels at a constant angular velocity. At the instant shown, which person experiences the largest force from his or her chair (back and seat)? Assume you can neglect the size of the chairs, that is, the people are located the same distance from the axis of rotation.

(*a*) *A*

(*b*) *B*

(*c*) *C*

(*d*) *D*

(*e*) The force is the same for all the passengers.

SOLUTION

Answer: (*c*) Draw a FBD and KD at each location and it will be clear that the maximum force will be experiences by the person at Point *C*.

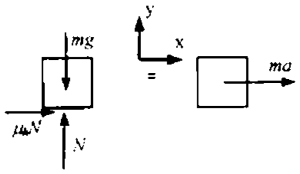
PROBLEM 12.F1

Crate A is gently placed with zero initial velocity onto a moving conveyor belt. The coefficient of kinetic friction between the crate and the belt is μ_k. Draw the FBD and KD for A immediately after it contacts the belt.

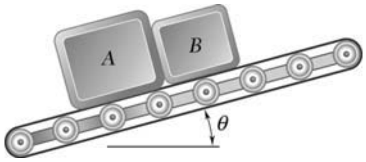
SOLUTION

Answer:



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.F2

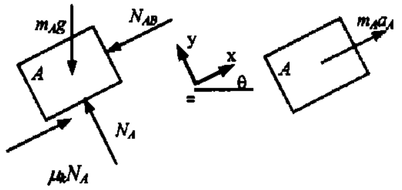


Two blocks weighing W_A and W_B are at rest on a conveyor that is initially at rest. The belt is suddenly started in an upward direction so that slipping occurs between the belt and the boxes. Assuming the coefficient of friction between the boxes and the belt is μ_k, draw the FBDs and KDs for blocks A and B. How would you determine if A and B remain in contact?

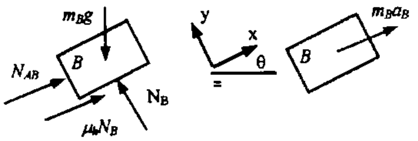
SOLUTION

Answer:

Block A



Block B



To see if they remain in contact assume $a_A = a_B$ and then check to see if N_{AB} is greater than zero.

PROBLEM 12.1

Astronauts who landed on the moon during the Apollo 15, 16 and 17 missions brought back a large collection of rocks to the earth. Knowing the rocks weighed 139 lb when they were on the moon, determine (*a*) the weight of the rocks on the earth, (*b*) the mass of the rocks in slugs. The acceleration due to gravity on the moon is 5.30 ft/s^2.

SOLUTION

Since the rocks weighed 139 lb on the moon, their mass is

$$m = \frac{W_{\text{moon}}}{g_{\text{moon}}} = \frac{139 \text{ lb}}{5.30 \text{ ft/s}^2} = 26.226 \text{ lb} \cdot \text{s}^2/\text{ft}$$

(*a*) On the earth, $W_{\text{earth}} = mg_{\text{earth}}$

$$w = (26.226 \text{ lb} \cdot \text{s}^2/\text{ft})(32.2 \text{ ft/s}^2) \qquad w = 844 \text{ lb} \blacktriangleleft$$

(*b*) Since $1 \text{ slug} = 1 \text{ lb} \cdot \text{s}^2/\text{ft}$, $\qquad m = 26.2 \text{ slugs} \blacktriangleleft$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.2

The value of g at any latitude ϕ may be obtained from the formula

$$g = 32.09(1 + 0.0053 \sin^2\phi) \text{ ft/s}^2$$

which takes into account the effect of the rotation of the earth, as well as the fact that the earth is not truly spherical. Determine to four significant figures (*a*) the weight in pounds, (*b*) the mass in pounds, (*c*) the mass in $\text{lb} \cdot \text{s}^2/\text{ft}$, at the latitudes of 0°, 45°, and 60°, of a silver bar, the mass of which has been officially designated as 5 lb.

SOLUTION

$$g = 32.09(1 + 0.0053 \sin^2\phi) \text{ ft/s}^2$$

$\phi = 0°$: $\quad g = 32.09 \text{ ft/s}^2$

$\phi = 45°$: $\quad g = 32.175 \text{ ft/s}^2$

$\phi = 90°$: $\quad g = 32.26 \text{ ft/s}^2$

(*a*) Weight: $\quad W = mg$

$\phi = 0°$: $\quad W = (0.1554 \text{ lb} \cdot \text{s}^2/\text{ft})(32.09 \text{ ft/s}^2) = 4.987 \text{ lb}$ ◀

$\phi = 45°$: $\quad W = (0.1554 \text{ lb} \cdot \text{s}^2/\text{ft})(32.175 \text{ ft/s}^2) = 5.000 \text{ lb}$ ◀

$\phi = 90°$: $\quad W = (0.1554 \text{ lb} \cdot \text{s}^2/\text{ft})(32.26 \text{ ft/s}^2) = 5.013 \text{ lb}$ ◀

(*b*) Mass: At all latitudes: $\quad m = 5.000 \text{ lb}$ ◀

(*c*) or $\quad m = \dfrac{5.00 \text{ lb}}{32.175 \text{ ft/s}^2} \quad m = 0.1554 \text{ lb} \cdot \text{s}^2/\text{ft}$ ◀

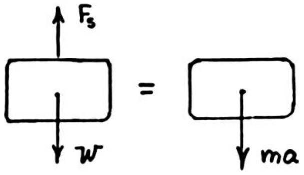
PROBLEM 12.4

A spring scale A and a lever scale B having equal lever arms are fastened to the roof of an elevator, and identical packages are attached to the scales as shown. Knowing that when the elevator moves downward with an acceleration of $1\ \text{m/s}^2$ the spring scale indicates a load of 60 N, determine (*a*) the weight of the packages, (*b*) the load indicated by the spring scale and the mass needed to balance the lever scale when the elevator moves upward with an acceleration of $1\ \text{m/s}^2$.

SOLUTION

Assume $g = 9.81\ \text{m/s}^2$



$$m = \frac{W}{g}$$

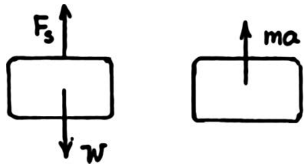
$$+\uparrow\ \Sigma F = ma: \quad F_s - W = -\frac{W}{g}a$$

$$W\left(1 - \frac{a}{g}\right) = F_s$$

or $$W = \frac{F_s}{1 - \frac{a}{g}} = \frac{60}{1 - \frac{1}{9.81}}$$

$$W = 66.8\ \text{N} \blacktriangleleft$$

(*b*)



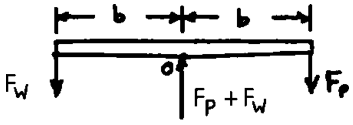
$$\Sigma F = ma: \quad F_s - W = \frac{W}{g}a$$

$$F_s = W\left(1 + \frac{a}{g}\right)$$

$$= 66.81\left(1 + \frac{1}{9.81}\right)$$

$$F_s = 73.6\ \text{N} \blacktriangleleft$$

For the balance system B,



$$\Sigma M_0 = 0: \quad bF_w - bF_p = 0$$

$$F_w = F_p$$

PROBLEM 12.4 (Continued)

But $$F_w = W_w\left(1+\frac{a}{g}\right)$$

and $$F_p = W_p\left(1+\frac{a}{g}\right)$$

so that $$W_w = W_p$$

and $$m_w = \frac{W_p}{g} = \frac{66.81}{9.81}$$ $m_w = 6.81\text{ kg}$ ◀

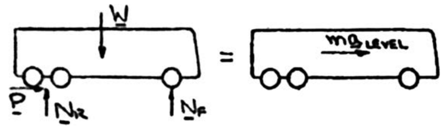
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.5

In anticipation of a long 7° upgrade, a bus driver accelerates at a constant rate of 3 ft/s^2 while still on a level section of the highway. Knowing that the speed of the bus is 60 mi/h as it begins to climb the grade and that the driver does not change the setting of his throttle or shift gears, determine the distance traveled by the bus up the grade when its speed has decreased to 50 mi/h.

SOLUTION

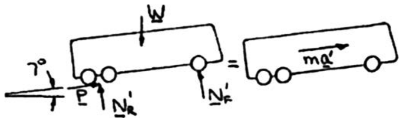
First consider when the bus is on the level section of the highway.



$$a_{\text{level}} = 3 \text{ ft/s}^2$$

We have $\xrightarrow{+} \Sigma F_x = ma$: $\quad P = \dfrac{W}{g} a_{\text{level}}$

Now consider when the bus is on the upgrade.



We have $+\nearrow \Sigma F_x = ma$: $\quad P - W \sin 7° = \dfrac{W}{g} a'$

Substituting for P $\qquad \dfrac{W}{g} a_{\text{level}} - W \sin 7° = \dfrac{W}{g} a'$

or

$$\begin{aligned} a' &= a_{\text{level}} - g \sin 7° \\ &= (3 - 32.2 \sin 7°) \text{ ft/s}^2 \\ &= -0.92419 \text{ ft/s}^2 \end{aligned}$$

For the uniformly decelerated motion

$$v^2 = (v_0)^2_{\text{upgrade}} + 2a'(x_{\text{upgrade}} - 0)$$

Noting that $60 \text{ mi/h} = 88 \text{ ft/s}$, then when $v = 50 \text{ mi/h}\left(= \dfrac{5}{6} v_0\right)$, we have

$$\left(\frac{5}{6} \times 88 \text{ ft/s}\right)^2 = (88 \text{ ft/s})^2 + 2(-0.92419 \text{ ft/s}^2) x_{\text{upgrade}}$$

or $\qquad x_{\text{upgrade}} = 1280.16 \text{ ft}$

or $\qquad x_{\text{upgrade}} = 0.242 \text{ mi}$ ◀

PROBLEM 12.6

A hockey player hits a puck so that it comes to rest 10 s after sliding 100 ft on the ice. Determine (*a*) the initial velocity of the puck, (*b*) the coefficient of friction between the puck and the ice.

SOLUTION

(*a*) Assume uniformly decelerated motion.

Then $v = v_0 + at$

At $t = 10$ s: $0 = v_0 + a(10)$

$$a = -\frac{v_0}{10}$$

Also $v^2 = v_0^2 + 2a(x - 0)$

At $t = 10$ s: $0 = v_0^2 + 2a(100)$

Substituting for a $0 = v_0^2 + 2\left(-\frac{v_0}{10}\right)(100) = 0$

$v_0 = 20.0$ ft/s or $v_0 = 20.0$ ft/s ◀

and $a = -\frac{20}{10} = -2 \text{ ft/s}^2$

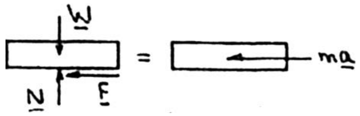
Alternate solution to part (*a*) $d = d_0 + v_0 t + \frac{1}{2} at^2$

$$d = v_0 t + \frac{1}{2}\left(-\frac{v_0}{t}\right)t^2$$

$$d = \frac{1}{2} v_0 t$$

$$v_0 = \frac{2d}{t}$$

(*b*) We have



$+\uparrow \Sigma F_y = 0$: $N - W = 0$ $N = W = mg$

Sliding: $F = \mu_k N = \mu_k mg$

$\xrightarrow{+} \Sigma F_x = ma$: $-F = ma$ $-\mu_k mg = ma$

$\mu_k = -\frac{a}{g} = -\frac{-2.0 \text{ ft/s}^2}{32.2 \text{ ft/s}^2}$ $\mu_k = 0.0621$ ◀

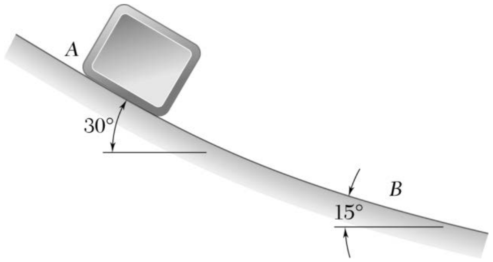
PROBLEM 12.7

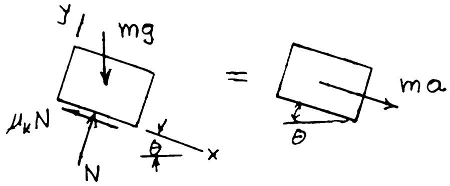


The acceleration of a package sliding at Point A is 3 m/s^2. Assuming that the coefficient of kinetic friction is the same for each section, determine the acceleration of the package at Point B.

SOLUTION

For any angle θ.

Use x and y coordinates as shown.



$$a_y = 0$$

$$+\nearrow \Sigma F_y = ma_y: \quad N - mg\cos\theta = 0$$

$$N = mg\cos\theta$$

$$+\searrow \Sigma F_x = ma_x: \quad mg\sin\theta - \mu_k N = ma_x$$

$$a_x = g(\sin\theta - \mu_k\cos\theta)$$

At Point A. $\quad \theta = 30°, \quad a_x = 3 \text{ m/s}^2$

$$\mu_k = \frac{g\sin 30° - a_x}{g\cos 30°} = \frac{9.81\sin 30° - 3}{9.81\cos 30°} = 0.22423$$

At Point B. $\quad \theta = 15°, \quad \mu_k = 0.22423$

$$a_x = 9.81(\sin 15° - 0.22423\cos 15°)$$

$$= 0.414 \text{ m/s}$$

$\mathbf{a} = 0.414 \text{ m/s}^2 \searrow 15°$ ◀

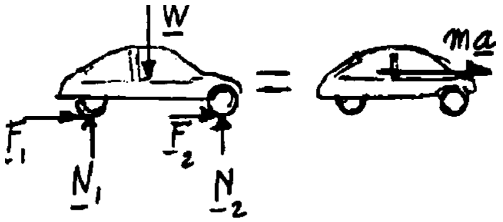
PROBLEM 12.8

Determine the maximum theoretical speed that may be achieved over a distance of 60 m by a car starting from rest, knowing that the coefficient of static friction is 0.80 between the tires and the pavement and that 60 percent of the weight of the car is distributed over its front wheels and 40 percent over its rear wheels. Assume (*a*) four-wheel drive, (*b*) front-wheel drive, (*c*) rear-wheel drive.

SOLUTION

(*a*) Four-wheel drive



$$+\uparrow \Sigma F_y = 0: \quad N_1 + N_2 - W = 0$$

$$F_1 + F_2 = \mu N_1 + \mu N_2$$
$$= \mu(N_1 + N_2) = \mu w$$

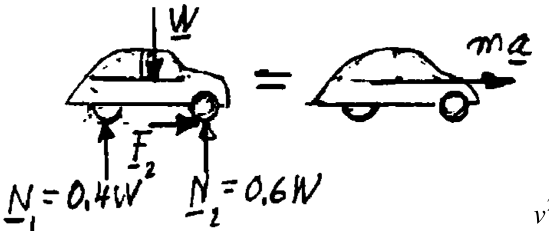
$$\xrightarrow{+} \Sigma F_x = ma: \quad F_1 + F_2 = ma$$
$$\mu w = ma$$

$$a = \frac{\mu W}{m} = \mu \frac{mg}{m} = \mu g = 0.80(9.81)$$
$$a = 7.848 \text{ m/s}^2$$

$$v^2 = 2ax = 2(7.848 \text{ m/s}^2)(60 \text{ m}) = 941.76 \text{ m}^2/\text{s}^2$$

$v = 30.69$ m/s $\qquad$ $v = 110.5$ km/h ◀

(*b*) Front-wheel drive



$$F_2 = ma$$
$$\mu(0.6\,W) = ma$$

$$a = \frac{0.6\mu W}{m} = \frac{0.6\mu mg}{m}$$
$$= 0.6\mu g = 0.6(0.80)(9.81)$$
$$a = 4.709 \text{ m/s}^2$$

$$v^2 = 2ax = 2(4.709 \text{ m/s}^2)(60 \text{ m}) = 565.1 \text{ m}^2/\text{s}^2$$

$v = 23.77$ m/s $\qquad$ $v = 85.6$ km/h ◀

PROBLEM 12.9

If an automobile's braking distance from 90 km/h is 45 m on level pavement, determine the automobile's braking distance from 90 km/h when it is (*a*) going up a 5° incline, (*b*) going down a 3-percent incline. Assume the braking force is independent of grade.

SOLUTION

Assume uniformly decelerated motion in all cases.

For braking on the level surface,

$$v_0 = 90 \text{ km/h} = 25 \text{ m/s}, \quad v_f = 0$$

$$x_f - x_0 = 45 \text{ m}$$

$$v_f^2 = v_0^2 + 2a(x_f - x_0)$$

$$a = \frac{v_f^2 - v_0^2}{2(x_f - x_0)}$$

$$= \frac{0 - (25)^2}{(2)(45)}$$

$$= -6.9444 \text{ m/s}^2$$

Braking force.

$$F_b = ma$$

$$= \frac{W}{g}a$$

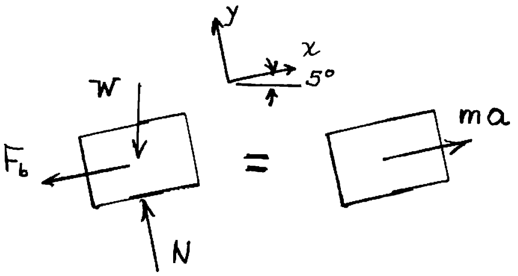
$$= -\frac{6.944}{9.81}W$$

$$= -0.70789W$$

(*a*) Going up a 5° incline.

$$\nearrow \Sigma F = ma$$

$$-F_b - W\sin 5° = \frac{W}{g}a$$



$$a = -\frac{F_b + W\sin 5°}{W}g$$

$$= -(0.70789 + \sin 5°)(9.81)$$

$$= -7.79944 \text{ m/s}^2$$

$$x_f - x_0 = \frac{v_f^2 - v_0^2}{2a}$$

$$= \frac{0 - (25)^2}{(2)(-7.79944)}$$

$x_f - x_0 = 40.1 \text{ m}$ ◀

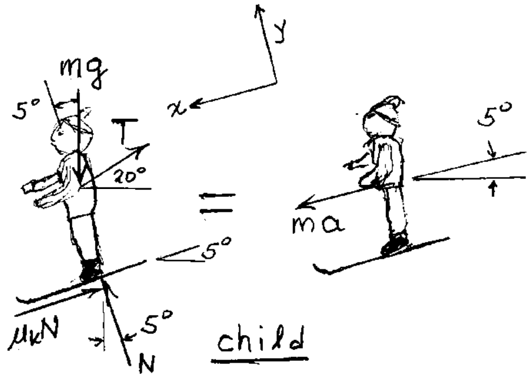
PROBLEM 12.10

A mother and her child are skiing together, and the mother is holding the end of a rope tied to the child's waist. They are moving at a speed of 7.2 km/h on a gently sloping portion of the ski slope when the mother observes that they are approaching a steep descent. She pulls on the rope with an average force of 7 N. Knowing the coefficient of friction between the child and the ground is 0.1 and the angle of the rope does not change, determine (*a*) the time required for the child's speed to be cut in half, (*b*) the distance traveled in this time.

SOLUTION

Draw free body diagram of child.



$\Sigma\mathbf{F} = m\mathbf{a}$:

x-direction: $mg\sin 5° - \mu_k N - T\cos 15° = ma$

y-direction: $N - mg\cos 5° + T\sin 15° = 0$

From *y*-direction,

$$N = mg\cos 5° - T\sin 15° = (20\text{ kg})(9.81\text{ m/s}^2)\cos 5° - (7\text{ N})\sin 15° = 193.64\text{ N}$$

From *x*-direction,

$$a = g\sin 5° - \frac{\mu_k N}{m} - \frac{T\cos 15°}{m}$$

$$= (9.81\text{ m/s}^2)\sin 5° - \frac{(0.1)(193.64\text{ N})}{20\text{ kg}} - \frac{(7\text{ N})\cos 15°}{20\text{ kg}}$$

$$= -0.45128\text{ m/s}^2 \qquad \text{(in } x\text{-direction.)}$$

$$v_0 = 7.2\text{ km/h} = 2\text{ m/s} \qquad x_0 = 0$$

$$v_f = \frac{1}{2}v_0 = 1\text{ m/s}$$

$$v_f = v_0 + at \qquad t = \frac{v_f - v_0}{a} = \frac{-1\text{ m/s}}{-0.45128\text{ m/s}^2} = 2.2159\text{ s}$$

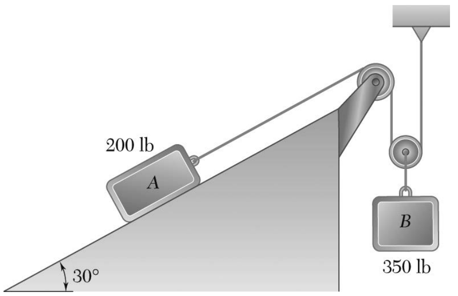
PROBLEM 12.14

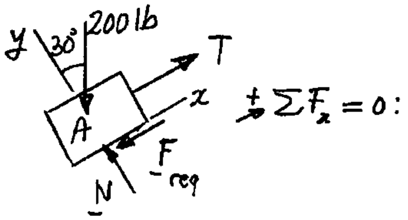


Solve Problem 12.13, assuming that the coefficients of friction between block A and the incline are $\mu_s = 0.25$ and $\mu_k = 0.20$.

PROBLEM 12.13 The two blocks shown are originally at rest. Neglecting the masses of the pulleys and the effect of friction in the pulleys and between block A and the incline, determine (a) the acceleration of each block, (b) the tension in the cable.

SOLUTION

We first determine whether the blocks move by computing the friction force required to maintain block A in equilibrium. T = 175 lb. When B in equilibrium,



$$+\nearrow\ \Sigma F_x = 0: \quad 175 - 200\sin 30° - F_{\text{req}} = 0$$

$$F_{\text{req}} = 75.0 \text{ lb}$$

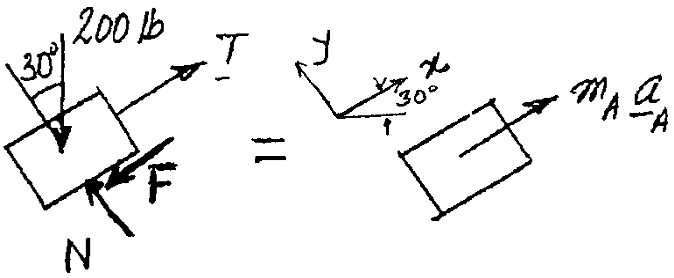
$$+\nwarrow\ \Sigma F_y = 0: \quad N - 200\cos 30° = 0 \quad N = 173.2 \text{ lb}$$

$$F_M = \mu_s N = 0.25(173.2 \text{ lb}) = 43.3 \text{ lb}$$

Since $F_{\text{req}} > \mathbf{F}_m$, blocks will move ($A$ up and B down).

We note that $a_B = \frac{1}{2} a_A$.

<u>Block A</u>

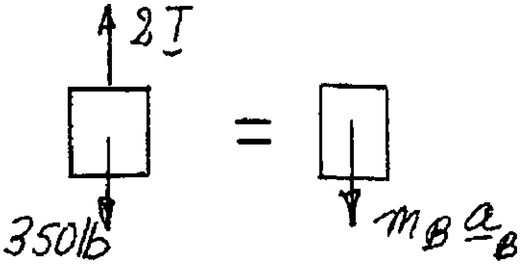


$$F = \mu_k N = (0.20)(173.2) = 34.64 \text{ lb.}$$

$$+\nearrow\ \Sigma F_x = m_A 0_A: \quad -200\sin 30° - 34.64 + T = \frac{200}{32.2} a_A \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Block *B*



$$+\downarrow \Sigma F_y = m_B a_B: \quad 350\,\text{lb} - 2T = \frac{350}{32.2}\left(\frac{1}{2}a_A\right) \qquad (2)$$

(*a*) Multiply Eq. (1) by 2 and add Eq. (2) in order to eliminate *T*:

$$-2(200)\sin 30° - 2(34.64) + 350 = 2\frac{200}{32.2}a_A + \frac{350}{32.2}\left(\frac{1}{2}a_A\right)$$

$$81.32 = \frac{575}{32.2}a_A$$

$a_A = 4.55\text{ ft/s}^2 \measuredangle 30°$ ◀

$$a_B = \frac{1}{2}a_A = \frac{1}{2}(4.52\text{ ft/s}^2),$$

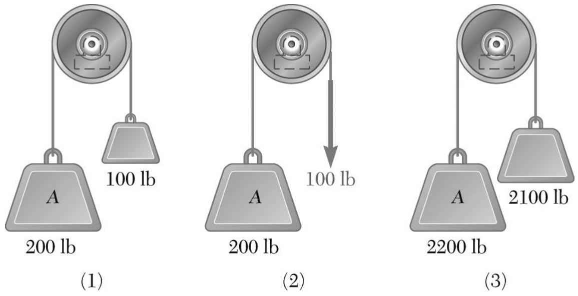
$a_B = 2.28\text{ ft/s}^2 \downarrow$ ◀

(*b*) From Eq. (1), $T - (200)\sin 30° - 34.64 = \frac{200}{32.2}(4.52)$

$T = 162.9\text{ lb}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.15



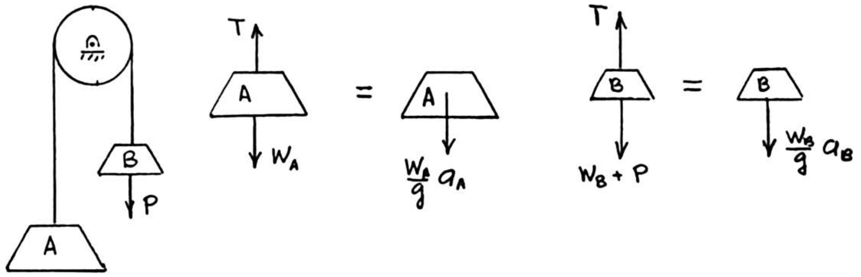
Each of the systems shown is initially at rest. Neglecting axle friction and the masses of the pulleys, determine for each system (*a*) the acceleration of block *A*, (*b*) the velocity of block *A* after it has moved through 10 ft, (*c*) the time required for block *A* to reach a velocity of 20 ft/s.

SOLUTION

Let *y* be positive downward for both blocks.

Constraint of cable: $y_A + y_B = \text{constant}$

$$a_A + a_B = 0 \qquad \text{or} \qquad a_B = -a_A$$



For blocks *A* and *B*, $+\downarrow \Sigma F = ma$:

Block *A*: $$W_A - T = \frac{W_A}{g}a_A \qquad \text{or} \qquad T = W_A - \frac{W_A}{g}a_A$$

Block *B*: $$P + W_B - T = \frac{W_B}{g}a_B = -\frac{W_B}{g}a_A$$

$$P + W_B - W_A + \frac{W_A}{g}a_A = -\frac{W_B}{g}a_A$$

Solving for a_A, $$a_A = \frac{W_A - W_B - P}{W_A + W_B}g \qquad (1)$$

$$v_A^2 - (v_A)_0^2 = 2a_A[y_A - (y_A)_0] \quad \text{with} \quad (v_A)_0 = 0$$

$$v_A = \sqrt{2a_A[y_A - (y_A)_0]} \qquad (2)$$

$$v_A - (v_A)_0 = a_A t \quad \text{with} \quad (v_A)_0 = 0$$

$$t = \frac{v_A}{a_A} \qquad (3)$$

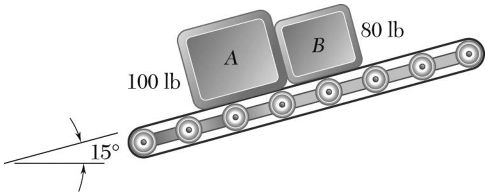
PROBLEM 12.16



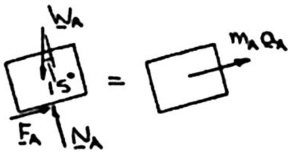
Boxes A and B are at rest on a conveyor belt that is initially at rest. The belt is suddenly started in an upward direction so that slipping occurs between the belt and the boxes. Knowing that the coefficients of kinetic friction between the belt and the boxes are $(\mu_k)_A = 0.30$ and $(\mu_k)_B = 0.32$, determine the initial acceleration of each box.

SOLUTION

Assume that $a_B > a_A$ so that the normal force N_{AB} between the boxes is zero.

$$A: \quad +\nwarrow \Sigma F_y = 0: \quad N_A - W_A \cos 15° = 0$$

A:



or $$N_A = W_A \cos 15°$$

Slipping: $$F_A = (\mu_k)_A N_A$$
$$= 0.3 W_A \cos 15°$$

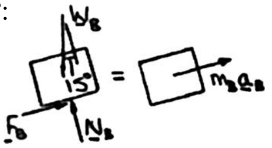
$$+\nearrow \Sigma F_x = m_A a_A: \quad F_A - W_A \sin 15° = m_A a_A$$

or $$0.3 W_A \cos 15° - W_A \sin 15° = \frac{W_A}{g} a_A$$

or $$a_A = (32.2 \text{ ft/s}^2)(0.3 \cos 15° - \sin 15°)$$
$$= 0.997 \text{ ft/s}^2$$

$$B: \quad +\nwarrow \Sigma F_y = 0: \quad N_B - W_B \cos 15° = 0$$

B:



or $$N_B = W_B \cos 15°$$

Slipping: $$F_B = (\mu_k)_B N_B$$
$$= 0.32 W_B \cos 15°$$

$$+\nearrow \Sigma F_x = m_B a_B: \quad F_B - W_B \sin 15° = m_B a_B$$

or $$0.32 W_B \cos 15° - W_B \sin 15° = \frac{W_B}{g} a_B$$

or $$a_B = (32.2 \text{ ft/s}^2)(0.32 \cos 15° - \sin 15°) = 1.619 \text{ ft/s}^2$$

$$a_B > a_A \Rightarrow \text{ assumption is correct}$$

$$\mathbf{a}_A = 0.997 \text{ ft/s}^2 \measuredangle 15° \blacktriangleleft$$

$$\mathbf{a}_B = 1.619 \text{ ft/s}^2 \measuredangle 15° \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.16 (Continued)

Note: If it is assumed that the boxes remain in contact $(N_{AB} \neq 0)$, then assuming N_{AB} to be compression,

$$a_A = a_B \quad \text{and find} \quad (\Sigma F_x = ma) \text{ for each box.}$$

A:
$$0.3W_A \cos 15° - W_A \sin 15° - N_{AB} = \frac{W_A}{g} a$$

B:
$$0.32W_B \cos 15° - W_B \sin 15° + N_{AB} = \frac{W_B}{g} a$$

Solving yields $a = 1.273 \text{ ft/s}^2$ and $N_{AB} = -0.859$ lb, which contradicts the assumption.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.17

A 5000-lb truck is being used to lift a 1000 lb boulder *B* that is on a 200 lb pallet *A*. Knowing the acceleration of the truck is 1 ft/s^2, determine (*a*) the horizontal force between the tires and the ground, (*b*) the force between the boulder and the pallet.

SOLUTION

Kinematics: $\quad \mathbf{a}_T = 1 \text{ m/s}^2 \longleftarrow$

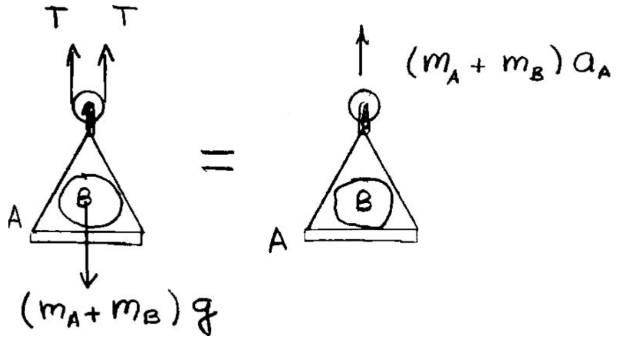
$$\mathbf{a}_A = \mathbf{a}_B = 0.5 \text{ m/s}^2 \uparrow$$

Masses: $\quad m_T = \dfrac{5000}{32.2} = 155.28 \text{ slugs}$

$$m_A = \frac{200}{32.2} = 6.211 \text{ slugs}$$

$$m_B = \frac{1000}{32.2} = 31.056 \text{ slugs}$$

Let *T* be the tension in the cable. Apply Newton's second law to the lower pulley, pallet and boulder.



Vertical components $+\uparrow$:

$$2T - (m_A + m_B)g = (m_A + m_B)a_A$$
$$2T - (37.267)(32.2) = (37.267)(0.5)$$

$$T = 609.32 \text{ lb}$$

Apply Newton's second law to the truck.

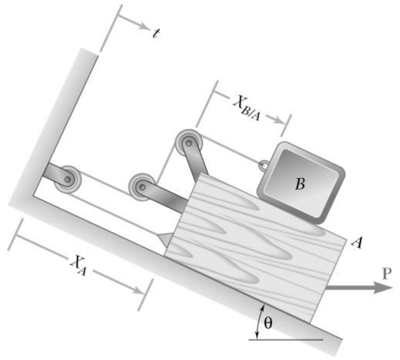
PROBLEM 12.18

Block A has a mass of 40 kg, and block B has a mass of 8 kg. The coefficients of friction between all surfaces of contact are $\mu_s = 0.20$ and $\mu_k = 0.15$. If $P = 0$, determine (a) the acceleration of block B, (b) the tension in the cord.

SOLUTION



From the constraint of the cord:

$$2x_A + x_{B/A} = \text{constant}$$

Then $$2v_A + v_{B/A} = 0$$

and $$2a_A + a_{B/A} = 0$$

Now $$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

Then $$a_B = a_A + (-2a_A)$$

or $$a_B = -a_A \qquad (1)$$

First we determine if the blocks will move for the given value of θ. Thus, we seek the value of θ for which the blocks are in impending motion, with the impending motion of A down the incline.

B: $$+\nearrow \Sigma F_y = 0: \quad N_{AB} - W_B \cos\theta = 0$$

B:

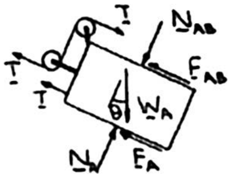
or $$N_{AB} = m_B g \cos\theta$$

Now $$F_{AB} = \mu_s N_{AB}$$
$$= 0.2 m_B g \cos\theta$$

$$+\searrow \Sigma F_x = 0: \quad -T + F_{AB} + W_B \sin\theta = 0$$

or $$T = m_B g (0.2\cos\theta + \sin\theta)$$

A:



A: $$+\nearrow \Sigma F_y = 0: \quad N_A - N_{AB} - W_A \cos\theta = 0$$

or $$N_A = (m_A + m_B) g \cos\theta$$

Now $$F_A = \mu_s N_A$$
$$= 0.2(m_A + m_B) g \cos\theta$$

$$+\searrow \Sigma F_x = 0: \quad -T - F_A - F_{AB} + W_A \sin\theta = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

or $$T = m_A g\sin\theta - 0.2(m_A + m_B)g\cos\theta - 0.2m_B g\cos\theta$$
$$= g[m_A\sin\theta - 0.2(m_A + 2m_B)\cos\theta]$$

Equating the two expressions for T

$$m_B g(0.2\cos\theta + \sin\theta) = g[m_A\sin\theta - 0.2(m_A + 2m_B)\cos\theta]$$

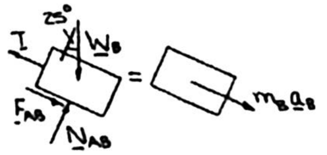
or $$8(0.2 + \tan\theta) = [40\tan\theta - 0.2(40 + 2\times 8)]$$

or $$\tan\theta = 0.4$$

or $\theta = 21.8°$ for impending motion. Since $\theta < 25°$, the blocks will move. Now consider the motion of the blocks.

(*a*) $+\!\nearrow \Sigma F_y = 0$: $N_{AB} - W_B\cos 25° = 0$

B:



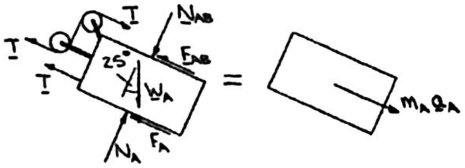
or $$N_{AB} = m_B g\cos 25°$$

Sliding: $$F_{AB} = \mu_k N_{AB} = 0.15 m_B g\cos 25°$$

$$\overset{+}{\searrow}\Sigma F_x = m_B a_B:\quad -T + F_{AB} + W_B\sin 25° = m_B a_B$$

or $$T = m_B[g(0.15\cos 25° + \sin 25°) - a_B]$$
$$= 8[9.81(0.15\cos 25° + \sin 25°) - a_B]$$
$$= 8(5.47952 - a_B) \qquad \text{(N)}$$

A:



$$+\!\nearrow \Sigma F_y = 0:\quad N_A - N_{AB} - W_A\cos 25° = 0$$

or $$N_A = (m_A + m_B)g\cos 25°$$

Sliding: $$F_A = \mu_k N_A = 0.15(m_A + m_B)g\cos 25°$$

$$\overset{+}{\searrow}\Sigma F_x = m_A a_A:\quad -T - F_A - F_{AB} + W_A\sin 25° = m_A a_A$$

Substituting and using Eq. (1)

$$T = m_A g\ \sin 25° - 0.15(m_A + m_B)g\ \cos 25°$$
$$-0.15 m_B g\ \cos 25° - m_A(-a_B)$$
$$= g[m_A\ \sin 25° - 0.15(m_A + 2m_B)\cos 25°] + m_A a_B$$
$$= 9.81[40\ \sin 25° - 0.15(40 + 2\times 8)\cos 25°] + 40a_B$$
$$= 91.15202 + 40a_B \qquad \text{(N)}$$

Equating the two expressions for T

$$8(5.47952 - a_B) = 91.15202 + 40a_B$$

or $$a_B = -0.98575\ \text{m/s}^2$$

$$\mathbf{a}_B = 0.986\ \text{m/s}^2 \ \searrow\ 25° \ ◀$$

(*b*) We have $$T = 8[5.47952 - (-0.98575)]$$

or $$T = 51.7\ \text{N} \ ◀$$

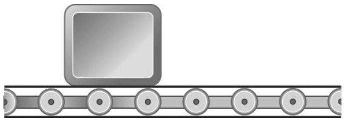
PROBLEM 12.20



A package is at rest on a conveyor belt which is initially at rest. The belt is started and moves to the right for 1.3 s with a constant acceleration of 2 m/s^2. The belt then moves with a constant deceleration $\mathbf{a}_2$ and comes to a stop after a total displacement of 2.2 m. Knowing that the coefficients of friction between the package and the belt are $\mu_s = 0.35$ and $\mu_k = 0.25$, determine (*a*) the deceleration $\mathbf{a}_2$ of the belt, (*b*) the displacement of the package relative to the belt as the belt comes to a stop.

SOLUTION

(*a*) Kinematics of the belt. $v_o = 0$

1. Acceleration phase with $\mathbf{a}_1 = 2 \text{ m/s}^2 \longrightarrow$

$$v_1 = v_o + a_1 t_1 = 0 + (2)(1.3) = 2.6 \text{ m/s}$$

$$x_1 = x_o + v_o t_1 + \frac{1}{2} a_1 t_1^2 = 0 + 0 + \frac{1}{2}(2)(1.3)^2 = 1.69 \text{ m}$$

2. Deceleration phase: $v_2 = 0$ since the belt stops.

$$v_2^2 - v_1^2 = 2a_2(x_2 - x_1)$$

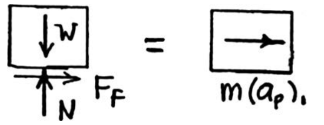
$$a_2 = \frac{v_2^2 - v_1^2}{2(x_2 - x_1)} = \frac{0 - (2.6)^2}{2(2.2 - 1.69)} = -6.63$$

$\mathbf{a}_2 = 6.63 \text{ m/s}^2 \longleftarrow$ ◀

$$t_2 - t_1 = \frac{v_2 - v_1}{a_2} = \frac{0 - 2.6}{-6.63} = 0.3923 \text{ s}$$

(*b*) Motion of the package.

1. Acceleration phase. Assume no slip. $(\mathbf{a}_p)_1 = 2 \text{ m/s}^2 \longrightarrow$



$$\Sigma F_y = 0: \quad N - W = 0 \text{ or } N = W = mg$$

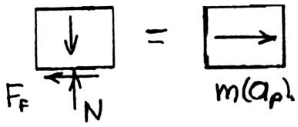
$$\xrightarrow{+} \Sigma F_x = ma: \quad F_f = m(a_p)_1$$

The required friction force is F_f.

The available friction force is $\mu_s N = 0.35W = 0.35mg$

$$\frac{F_f}{m} = (a_p)_1, < \frac{\mu_s N}{m} = \mu_s g = (0.35)(9.81) = 3.43 \text{ m/s}^2$$

Since $2.0 \text{ m/s}^2 < 3.43 \text{ m/s}^2$, the package does not slip.



$$(v_p)_1 = v_1 = 2.6 \text{ m/s and } (x_p)_1 = 1.69 \text{ m.}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

2. Deceleration phase. Assume no slip. $(a_p)_2 = -11.52 \text{ m/s}^2$

$$\xrightarrow{+} \Sigma F_x = ma: \quad -F_f = m(a_p)_2$$

$$\frac{F_f}{m} = (a_p)_2 = -6.63 \text{ m/s}^2$$

$$\frac{\mu_s N}{m} = \frac{\mu_s mg}{m} = \mu_s g = 3.43 \text{ m/s}^2 < 6.63 \text{ m/s}^2$$

Since the available friction force $\mu_s N$ is less than the required friction force F_f for no slip, the package does slip.

$$(a_p)_2 < 6.63 \text{ m/s}^2, \quad F_f = \mu_k N$$

$$\xrightarrow{+} \Sigma F_x = m(a_p)_2: \quad -\mu_k N = m(a_p)_2$$

$$\begin{aligned}(a_p)_2 &= -\frac{\mu_k N}{m} = -\mu_k g \\ &= -(0.25)(9.81) \\ &= -2.4525 \text{ m/s}^2\end{aligned}$$

$$\begin{aligned}(v_p)_2 &= (v_p)_1 + (a_p)_2(t_2 - t_1) \\ &= 2.6 + (-2.4525)(0.3923) \\ &= 1.638 \text{ m/s}^2\end{aligned}$$

$$\begin{aligned}(x_p)_2 &= (x_p)_1 + (v_p)_1(t_2 - t_1) + \frac{1}{2}(a_p)_2(t_2 - t_1)^2 \\ &= 1.69 + (2.6)(0.3923) + \frac{1}{2}(-2.4525)(0.3923)^2 \\ &= 2.521 \text{ m}\end{aligned}$$

Position of package relative to the belt

$$(x_p)_2 - x_2 = 2.521 - 2.2 = 0.321$$

$x_{p/\text{belt}} = 0.321 \text{ m} \longrightarrow$ ◀

PROBLEM 12.21

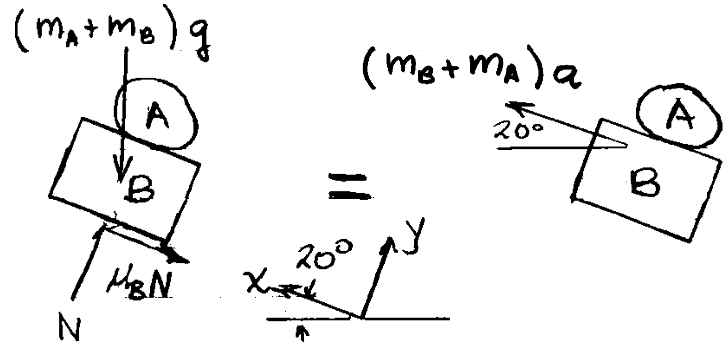
A baggage conveyor is used to unload luggage from an airplane. The 10-kg duffel bag *A* is sitting on top of the 20-kg suitcase *B*. The conveyor is moving the bags down at a constant speed of 0.5 m/s when the belt suddenly stops. Knowing that the coefficient of friction between the belt and *B* is 0.3 and that bag *A* does not slip on suitcase *B*, determine the smallest allowable coefficient of static friction between the bags.

SOLUTION

Since bag *A* does not slide on suitcase *B*, both have the same acceleration.

$$\mathbf{a} = a \searrow 20°$$

Apply Newton's second law to the bag *A* – suitcase *B* combination treated as a single particle.



$$+\nearrow \Sigma F_y = ma_y: \quad -(m_B + m_A)g\cos 20° + N = 0$$

$$N = (m_A + m_B)g\cos 30° = (30)(9.81)\cos 20° = 276.55 \text{ N}$$

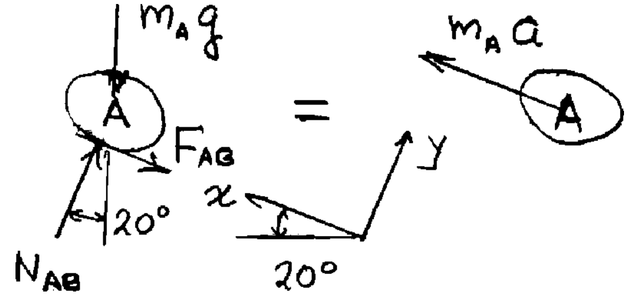
$$\mu_B N = (0.3)(276.55) = 82.965 \text{ N}$$

$$+\nwarrow \Sigma F_x = ma_x: \quad \mu_B N + (m_A + m_B)g\sin 20° = (m_A + m_B)a$$

$$a = g\sin 20° + \frac{\mu_B N}{m_A m_B} = 9.81\sin 20° - \frac{82.965}{30}$$

$$a = 0.58972 \text{ m/s}^2 \qquad \mathbf{a} = 0.58972 \text{ m/s}^2 \nearrow 20°$$

Apply Newton's second law to bag *A* alone.



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.22

To unload a bound stack of plywood from a truck, the driver first tilts the bed of the truck and then accelerates from rest. Knowing that the coefficients of friction between the bottom sheet of plywood and the bed are $\mu_s = 0.40$ and $\mu_k = 0.30$, determine (*a*) the smallest acceleration of the truck which will cause the stack of plywood to slide, (*b*) the acceleration of the truck which causes corner *A* of the stack to reach the end of the bed in 0.9 s.

SOLUTION

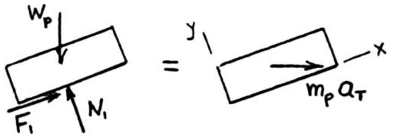
Let $\mathbf{a}_P$ be the acceleration of the plywood, $\mathbf{a}_T$ be the acceleration of the truck, and $\mathbf{a}_{P/T}$ be the acceleration of the plywood relative to the truck.

(*a*) Find the value of $\mathbf{a}_T$ so that the relative motion of the plywood with respect to the truck is impending.

$$a_P = a_T \text{ and } F_1 = \mu_s N_1 = 0.40 N_1$$

$$+\nwarrow \Sigma F_y = m_P a_y: \quad N_1 - W_P \cos 20° = -m_P a_T \sin 20°$$

$$N_1 = m_P (g \cos 20° - a_T \sin 20°)$$



$$+\nearrow \Sigma F_x = m a_x: \quad F_1 - W_P \sin 20° = m_P a_T \cos 20°$$

$$F_1 = m_P (g \sin 20° + a_T \cos 20°)$$

$$m_P (g \sin 20° + a_T \cos 20°) = 0.40\, m_P (g \cos 20° - a_T \sin 20°)$$

$$a_T = \frac{(0.40 \cos 20° - \sin 20°)}{\cos 20° + 0.40 \sin 20°} g$$

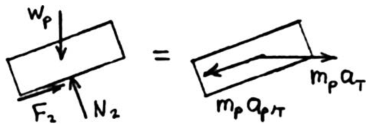
$$= (0.03145)(9.81)$$

$$= 0.309$$

$$\mathbf{a}_T = 0.309 \text{ m/s}^2 \longrightarrow \blacktriangleleft$$

(*b*) $$x_{P/T} = (x_{P/T})_o + (v_{P/T})t + \frac{1}{2} a_{P/T} t^2 = 0 + 0 + \frac{1}{2} a_{P/T} t^2$$

$$a_{P/T} = \frac{2 x_{P/T}}{t^2} = \frac{(2)(2)}{(0.9)^2} = 4.94 \text{ m/s}^2$$



$$\mathbf{a}_{P/T} = 4.94 \text{ m/s}^2 \swarrow 20°$$

$$\mathbf{a}_P = \mathbf{a}_T + \mathbf{a}_{P/T} = (a_T \rightarrow) + (4.94 \text{ m/s}^2 \swarrow 20°)$$

$$+\nwarrow F_y = m_P a_y: \quad N_2 - W_P \cos 20° = -m_P a_T \sin 20°$$

$$N_2 = m_P (g \cos 20° - a_T \sin 20°)$$

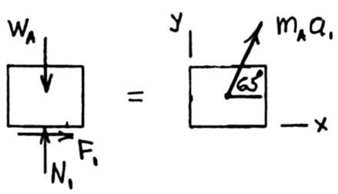
PROBLEM 12.23

To transport a series of bundles of shingles *A* to a roof, a contractor uses a motor-driven lift consisting of a horizontal platform *BC* which rides on rails attached to the sides of a ladder. The lift starts from rest and initially moves with a constant acceleration $\mathbf{a}_1$ as shown. The lift then decelerates at a constant rate $\mathbf{a}_2$ and comes to rest at *D*, near the top of the ladder. Knowing that the coefficient of static friction between a bundle of shingles and the horizontal platform is 0.30, determine the largest allowable acceleration $\mathbf{a}_1$ and the largest allowable deceleration $\mathbf{a}_2$ if the bundle is not to slide on the platform.

SOLUTION

Acceleration $\mathbf{a}_1$: Impending slip. $F_1 = \mu_s N_1 = 0.30 N_1$



$\Sigma F_y = m_A a_y$: $\quad N_1 - W_A = m_A a_1 \sin 65°$

$$N_1 = W_A + m_A a_1 \sin 65°$$

$$= m_A (g + a_1 \sin 65°)$$

$\xrightarrow{+} \Sigma F_x = m_A a_x$: $\quad F_1 = m_A a_1 \cos 65°$

$$F_1 = \mu_s N$$

or $\quad m_A a_1 \cos 65° = 0.30 m_A (g + a_1 \sin 65°)$

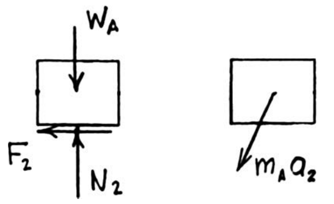
$$a_1 = \frac{0.30g}{\cos 65° - 0.30 \sin 65°}$$

$$= (1.990)(9.81)$$

$$= 19.53 \text{ m/s}^2$$

$\mathbf{a}_1 = 19.53 \text{ m/s}^2 \angle 65°$ ◀

Deceleration $\mathbf{a}_2$: Impending slip. $F_2 = \mu_s N_2 = 0.30 N_2$



$\Sigma F_y = m a_y$: $\quad N_1 - W_A = -m_A a_2 \sin 65°$

$$N_1 = W_A - m_A a_2 \sin 65°$$

$\xleftarrow{+} \Sigma F_x = m a_x$: $\quad F_2 = m_A a_2 \cos 65°$

$$F_2 = \mu_s N_2$$

PROBLEM 12.24

An airplane has a mass of 25 Mg and its engines develop a total thrust of 40 kN during take-off. If the drag **D** exerted on the plane has a magnitude $D = 2.25v^2$, where v is expressed in meters per second and D in newtons, and if the plane becomes airborne at a speed of 240 km/h, determine the length of runway required for the plane to take off.

SOLUTION

$$F = ma: \quad 40\times 10^3 \text{ N} - 2.25v^2 = (25\times 10^3 \text{ kg})a$$

Substituting

$$a = v\frac{dv}{dx}: \quad 40\times 10^3 - 2.25\ v^2 = (25\times 10^3)\ v\frac{dv}{dx}$$

$$\int_0^{x_1} dx = \int_0^{v_1} \frac{(25\times 10^3)v\,dv}{40\times 10^3 - 2.25v^2}$$

$$x_1 = -\frac{25\times 10^3}{2(2.25)}\left[\ln(40\times 10^3 - 2.25v^2)\right]_0^{v_1}$$

$$= \frac{25\times 10^3}{4.5}\ln\frac{40\times 10^3}{40\times 10^3 - 2.25v_1^2}$$

For $v_1 = 240 \text{ km/h} = 66.67 \text{ m/s}$

$$x_1 = \frac{25\times 10^3}{4.5}\ln\frac{40\times 10^3}{40\times 10^3 - 2.25(66.67)^2} = 5.556\ln 1.333$$

$$= 1.5982\times 10^3 \text{ m}$$

$x_1 = 1.598 \text{ km}$ ◀

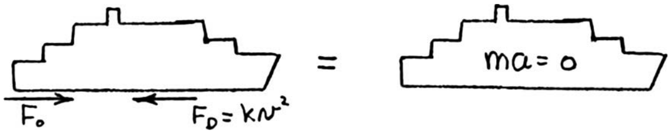
PROBLEM 12.25

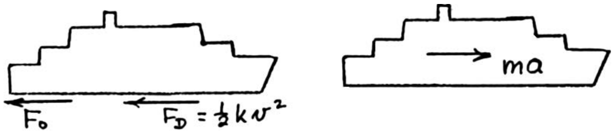
The propellers of a ship of weight W can produce a propulsive force $\mathbf{F}_0$; they produce a force of the same magnitude but of opposite direction when the engines are reversed. Knowing that the ship was proceeding forward at its maximum speed v_0 when the engines were put into reverse, determine the distance the ship travels before coming to a stop. Assume that the frictional resistance of the water varies directly with the square of the velocity.

SOLUTION



At maximum speed $a = 0$. $\qquad F_0 = kv_0^2 = 0 \qquad k = \dfrac{F_0}{v_0^2}$

When the propellers are reversed, F_0 is reversed.



$$\xrightarrow{+} \Sigma F_x = ma: \quad -F_0 - kv^2 = ma$$

$$-F_0 - F_0 \frac{v^2}{v_0^2} = ma \qquad a - \frac{F_0}{mv_0^2}\left(v_0^2 + v^2\right)$$

$$dx = \frac{vdv}{a} = \frac{mv_0^2 vdv}{F_0\left(v_0^2 + v^2\right)}$$

$$\int_0^x dx = -\frac{mv_0^2}{F_0}\int_{v_0}^0 \frac{vdv}{v_0^2 + v^2}$$

$$x = -\frac{mv_0^2}{F_0}\frac{1}{2}\ln\left(v_0^2 + v^2\right)\Big|_{v_0}^0$$

$$= -\frac{mv_0^2}{2F_0}\left[\ln v_0^2 - \ln\left(2v_0^2\right)\right] = \frac{mv_0^2}{2F_0}\ln 2 \qquad x = 0.347\frac{m_0 v_0^2}{F_0} \blacktriangleleft$$

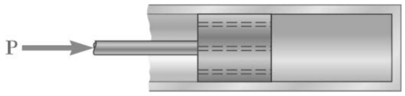
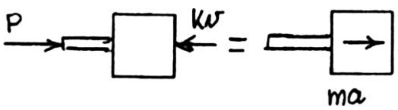
PROBLEM 12.26



A constant force **P** is applied to a piston and rod of total mass m to make them move in a cylinder filled with oil. As the piston moves, the oil is forced through orifices in the piston and exerts on the piston a force of magnitude kv in a direction opposite to the motion of the piston. Knowing that the piston starts from rest at $t = 0$ and $x = 0$, show that the equation relating x, v, and t, where x is the distance traveled by the piston and v is the speed of the piston, is linear in each of these variables.

SOLUTION

$$\xrightarrow{+} \Sigma F = ma: \quad P - kv = ma$$



$$\frac{dv}{dt} = a = \frac{P - kv}{m}$$

$$\int_0^t dt = \int_0^v \frac{m\,dv}{P - kv}$$

$$= -\frac{m}{k}\ln(P - kv)\Big|_0^v$$

$$= -\frac{m}{k}[\ln(P - kv) - \ln P]$$

$$t = -\frac{m}{k}\ln\frac{P - kv}{P} \qquad \text{or} \qquad \ln\frac{P - kv}{m} = -\frac{kt}{m}$$

$$\frac{P - kv}{m} = e^{-kt/m} \qquad \text{or} \qquad v = \frac{P}{k}(1 - e^{-kt/m})$$

$$x = \int_0^t v\,dt = \frac{Pt}{k}\Big|_0^t - \frac{P}{k}\left(-\frac{k}{m}e^{-kt/m}\right)\Bigg|_0^t$$

$$= \frac{Pt}{k} + \frac{P}{m}(e^{-kt/m} - 1) = \frac{Pt}{k} - \frac{P}{m}(1 - e^{-kt/m})$$

$$x = \frac{Pt}{k} - \frac{kv}{m}, \quad \text{which is linear.}$$ ◀

PROBLEM 12.27

A spring AB of constant k is attached to a support at A and to a collar of mass m. The unstretched length of the spring is ℓ. Knowing that the collar is released from rest at $x = x_0$ and neglecting friction between the collar and the horizontal rod, determine the magnitude of the velocity of the collar as it passes through Point C.

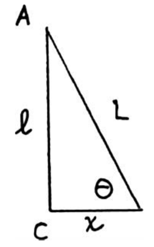
SOLUTION

Choose the origin at Point C and let x be positive to the right. Then x is a position coordinate of the slider B and x_0 is its initial value. Let L be the stretched length of the spring. Then, from the right triangle

$$L = \sqrt{\ell^2 + x^2}$$

The elongation of the spring is $e = L - \ell$, and the magnitude of the force exerted by the spring is

$$F_s = ke = k(\sqrt{\ell^2 + x^2} - \ell)$$



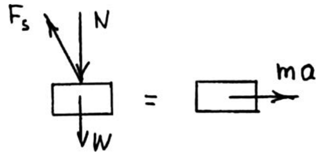
By geometry,

$$\cos\theta = \frac{x}{\sqrt{\ell^2 + x^2}}$$

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad -F_s \cos\theta = ma$$

$$-k(\sqrt{\ell^2 + x^2} - \ell)\frac{x}{\sqrt{\ell^2 + x^2}} = ma$$

$$a = -\frac{k}{m}\left(x - \frac{\ell x}{\sqrt{\ell^2 + x^2}}\right)$$



$$\int_0^v v\,dv = \int_{x_0}^0 a\,dx$$

$$\frac{1}{2}v^2\Big|_0^v = -\frac{k}{m}\int_{x_0}^0\left(x - \frac{\ell x}{\sqrt{\ell^2 + x^2}}\right)dx = -\frac{k}{m}\left(\frac{1}{2}x^2 - \ell\sqrt{\ell^2 + x^2}\right)\Bigg|_{x_0}^0$$

$$\frac{1}{2}v^2 = -\frac{k}{m}\left(0 - \ell^2 - \frac{1}{2}x_0^2 + \ell\sqrt{\ell^2 + x_0^2}\right)$$

$$v^2 = \frac{k}{m}\left(2\ell^2 + x_0^2 - 2\ell\sqrt{\ell^2 + x_0^2}\right)$$

$$= \frac{k}{m}\left[\left(\ell^2 + x_0^2\right) - 2\ell\sqrt{\ell^2 + x_0^2} + \ell^2\right]$$

answer: $v = \sqrt{\frac{k}{m}}\left(\sqrt{\ell^2 + x_0^2} - \ell\right)$ ◀

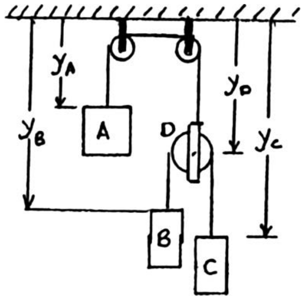
PROBLEM 12.28

Block A has a mass of 10 kg, and blocks B and C have masses of 5 kg each. Knowing that the blocks are initially at rest and that B moves through 3 m in 2 s, determine (a) the magnitude of the force **P**, (b) the tension in the cord AD. Neglect the masses of the pulleys and axle friction.

SOLUTION



Let the position coordinate y be positive downward.

Constraint of cord AD: $\quad y_A + y_D = \text{constant}$

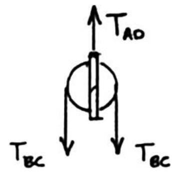
$$v_A + v_D = 0, \quad a_A + a_D = 0$$

Constraint of cord BC: $\quad (y_B - y_D) + (y_C - y_D) = \text{constant}$

$$v_B + v_C - 2v_D = 0, \quad a_B + a_C - 2a_D = 0$$

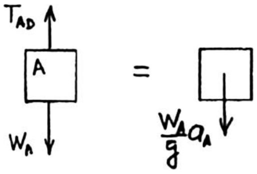
Eliminate a_D. $\quad 2a_A + a_B + a_C = 0 \qquad (1)$

We have uniformly accelerated motion because all of the forces are constant.



$$y_B = (y_B)_0 + (v_B)_0 t + \frac{1}{2}a_B t^2, \quad (v_B)_0 = 0$$

$$a_B = \frac{2[y_B - (y_B)_0]}{t^2} = \frac{(2)(3)}{(2)^2} = 1.5 \text{ m/s}^2$$



Pulley D: $\quad +\downarrow \Sigma F_y = 0: \quad 2T_{BC} - T_{AD} = 0$

$$T_{AD} = 2T_{BC}$$

Block A: $\quad +\downarrow \Sigma F_y = ma_y: \quad W_A - T_{AD} = m_A a_A$

or $\quad a_A = \dfrac{W_A - T_{AD}}{m_A} = \dfrac{W_A - 2T_{BC}}{m_A} \qquad (2)$

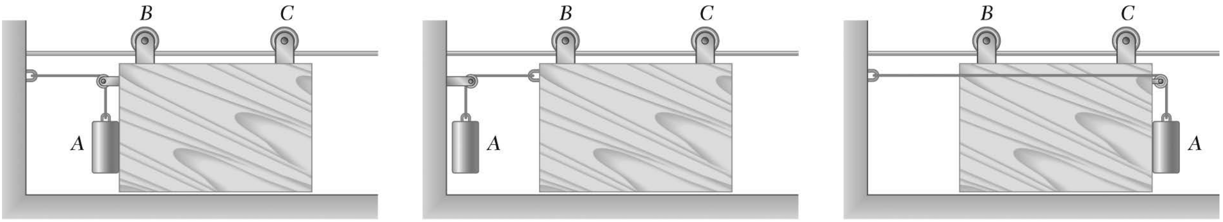
PROBLEM 12.29

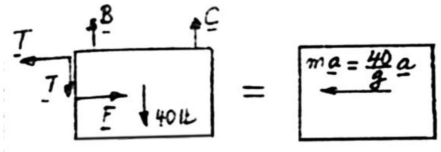
A 40-lb sliding panel is supported by rollers at *B* and *C*. A 25-lb counterweight *A* is attached to a cable as shown and, in cases *a* and *c*, is initially in contact with a vertical edge of the panel. Neglecting friction, determine in each case shown the acceleration of the panel and the tension in the cord immediately after the system is released from rest.



(*a*) (*b*) (*c*)

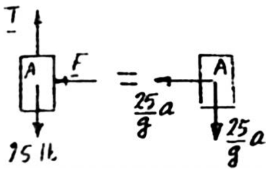
SOLUTION

(*a*) Panel: F = Force exerted by counterweight



$\overset{+}{\leftarrow} \Sigma F_x = ma$: $T - F = \dfrac{40}{g} a$ (1)

Counterweight *A*: Its acceleration has two components



$$\mathbf{a}_A = \mathbf{a}_P + \mathbf{a}_{A/P} = a \rightarrow + a \downarrow$$

$\overset{+}{\leftarrow} \Sigma F_x = ma_x$: $F = \dfrac{25}{g} a$ (2)

$+\downarrow \Sigma F_g = ma_g$: $25 - T = \dfrac{25}{g} a$ (3)

Adding (1), (2), and (3):

$$\not{T} - F + F + 25 - \not{T} = \frac{40 + 25 + 25}{g} a$$

$$a = \frac{25}{90} g = \frac{25}{90}(32.2)$$ $\mathbf{a} = 8.94 \text{ ft/s}^2 \longleftarrow$ ◀

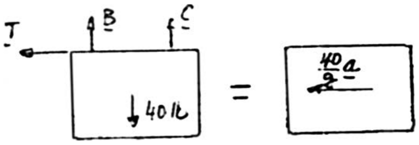
Substituting for a into (3):

$$25 - T = \frac{25}{g}\left(\frac{25}{90} g\right) \qquad T = 25 - \frac{625}{90}$$ $T = 18.06$ lb ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.29 (Continued)

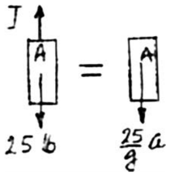
(*b*) Panel:



$\overset{+}{\longleftarrow} \Sigma F_y = ma:$ $$T = \frac{40}{g}a \qquad (1)$$

Counterweight *A*:

$+\!\downarrow \Sigma F_y = ma:$ $$25 - T = \frac{25}{g}a \qquad (2)$$



Adding (1) and (2): $$\not{T} + 25 - \not{T} = \frac{40+25}{g}a$$

$$a = \frac{25}{65}g$$

a $= 12.38 \text{ ft/s}^2 \longleftarrow$ ◀

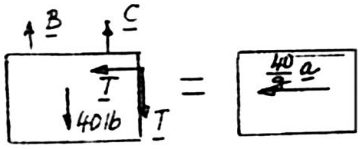
Substituting for *a* into (1):

$$T = \frac{40}{g}\left(\frac{25}{65}g\right) = \frac{1000}{65}$$

$T = 15.38$ lb ◀

(*c*) Since panel is accelerated to the left, there is no force exerted by panel on counterweight and vice versa.

Panel:



$\overset{+}{\longleftarrow} \Sigma F_x = ma:$ $$T = \frac{40}{g}a \qquad (1)$$

Counterweight *A*: Same free body as in Part (*b*):

$+\!\downarrow \Sigma F_y = ma:$ $$25 - T = \frac{25}{g}a \qquad (2)$$

Since Eqs. (1) and (2) are the same as in (*b*), we get the same answers:

a $= 12.38 \text{ ft/s}^2 \longleftarrow$; $T = 15.38$ lb ◀

PROBLEM 12.30

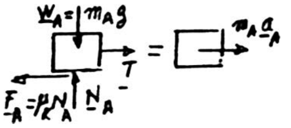
The coefficients of friction between blocks A and C and the horizontal surfaces are $\mu_s = 0.24$ and $\mu_k = 0.20$. Knowing that $m_A = 5$ kg, $m_B = 10$ kg, and $m_C = 10$ kg, determine (*a*) the tension in the cord, (*b*) the acceleration of each block.

SOLUTION

We first check that static equilibrium is not maintained:

$$(F_A)_m + (F_C)_m = \mu_s(m_A + m_C)g$$
$$= 0.24(5 + 10)g$$
$$= 3.6g$$

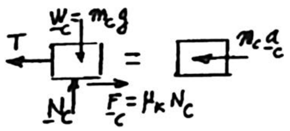
Since $W_B = m_B g = 10\text{g} > 3.6\text{g}$, equilibrium is *not* maintained.



Block A: $\qquad \Sigma F_y: \quad N_A = m_A g$

$$F_A = \mu_k N_A = 0.2 m_A g$$

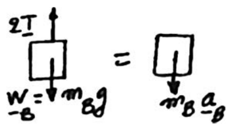
$$\xrightarrow{+} \Sigma F_\lambda = m_A a_A: \quad T - 0.2 m_A g = m_A a_A \qquad (1)$$



Block C: $\qquad \Sigma F_y: \quad N_C = m_C g$

$$F_C = \mu_k N_C = 0.2 m_C g$$

$$\xleftarrow{+} \Sigma F_x = m_C a_C: \quad T - 0.2 m_C g = m_C a_C \qquad (2)$$



Block B: $\qquad +\!\downarrow \Sigma F_y = m_B a_B$

$$m_B g - 2T = m_B a_B \qquad (3)$$

From kinematics: $\qquad a_B = \frac{1}{2}(a_A + a_C) \qquad (4)$

(*a*) Tension in cord. Given data: $\quad m_A = 5$ kg
$\qquad m_B = m_C = 10$ kg

Eq. (1): $\quad T - 0.2(5)g = 5a_A \qquad a_A = 0.2T - 0.2g \qquad (5)$

Eq. (2): $\quad T - 0.2(10)g = 10a_C \qquad a_C = 0.1T - 0.2g \qquad (6)$

Eq. (3): $\quad 10g - 2T = 10a_B \qquad a_B = g - 0.2T \qquad (7)$

PROBLEM 12.30 (Continued)

Substitute into (4):

$$g - 0.2T = \frac{1}{2}(0.2T - 0.2g + 0.1T - 0.2g)$$

$$1.2g = 0.35T \qquad T = \frac{24}{7}g = \frac{24}{7}(9.81 \text{ m/s}^2) \qquad T = 33.6 \text{ N} \blacktriangleleft$$

(*b*) Substitute for T into (5), (7), and (6):

$$a_A = 0.2\left(\frac{24}{7}g\right) - 0.2g = 0.4857(9.81 \text{ m/s}^2) \qquad \mathbf{a}_A = 4.76 \text{ m/s}^2 \longrightarrow \blacktriangleleft$$

$$a_B = g - 0.2\left(\frac{24}{7}g\right) = 0.3143(9.81 \text{ m/s}^2) \qquad \mathbf{a}_B = 3.08 \text{ m/s}^2 \downarrow \blacktriangleleft$$

$$a_C = 0.1\left(\frac{24}{7}g\right) - 0.2g = 0.14286(9.81 \text{ m/s}^2) \qquad \mathbf{a}_C = 1.401 \text{ m/s}^2 \longleftarrow \blacktriangleleft$$

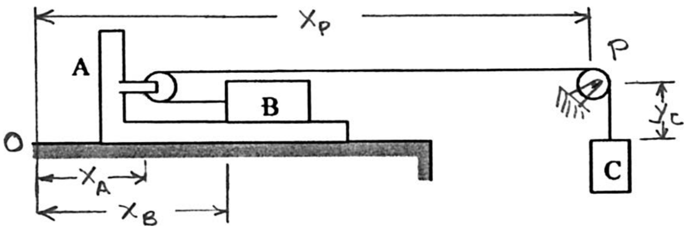
PROBLEM 12.31

A 10-lb block B rests as shown on a 20-lb bracket A. The coefficients of friction are $\mu_s = 0.30$ and $\mu_k = 0.25$ between block B and bracket A, and there is no friction in the pulley or between the bracket and the horizontal surface. (*a*) Determine the maximum weight of block C if block B is not to slide on bracket A. (*b*) If the weight of block C is 10% larger than the answer found in *a* determine the accelerations of A, B and C.

SOLUTION

<u>Kinematics</u>. Let x_A and x_B be horizontal coordinates of A and B measured from a fixed vertical line to the left of A and B. Let y_C be the distance that block C is below the pulley. Note that y_C increases when C moves downward. See figure.



The cable length L is fixed.

$$L = (x_B - x_A) + (x_P - x_A) + y_C + \text{constant}$$

Differentiating and noting that $\dot{x}_P = 0$,

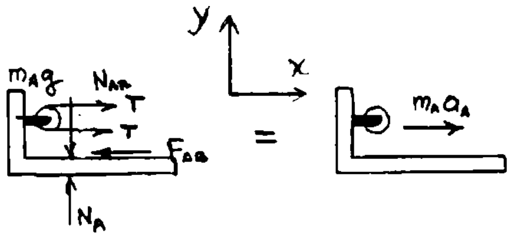
$$v_B - 2v_A + v_C = 0$$

$$-2a_A + a_B + a_C = 0 \qquad (1)$$

Here, a_A and a_B are positive to the right, and a_C is positive downward.

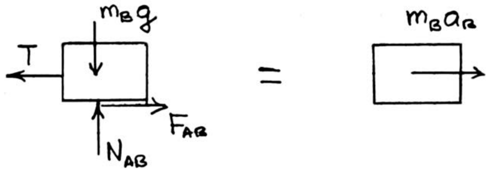
<u>Kinetics</u>. Let T be the tension in the cable and F_{AB} be the friction force between blocks A and B. The free body diagrams are:

Bracket A:

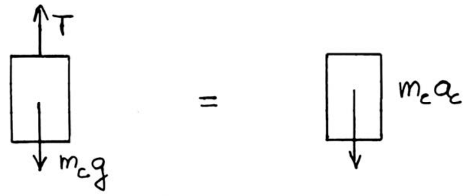


PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Block B:



Block C:



Bracket A: $\quad \xrightarrow{+} \Sigma F_x = ma_x: \quad 2T - F_{AB} = \frac{W_A}{g} a_A \qquad (2)$

Block B: $\quad \xrightarrow{+} \Sigma F_x = ma_x: \quad F_{AB} - T = \frac{W_B}{g} a_B \qquad (3)$

$$+\uparrow \Sigma F_y = ma_y: \quad N_{AB} - W_B = 0$$

or $\quad N_{AB} = W_B$

Block C: $\quad +\downarrow \Sigma F_y = ma_y: \quad m_C - T = \frac{W_C}{g} a_C \qquad (4)$

Adding Eqs. (2), (3), and (4), and transposing,

$$\frac{W_A}{g} a_A + \frac{W_B}{g} a_B + \frac{W_C}{g} a_C = W_C \qquad (5)$$

Subtracting Eq. (4) from Eq. (3) and transposing,

$$\frac{W_B}{g} a_B - \frac{W_C}{g} a_C = F_{AB} - W_C \qquad (6)$$

(a) No slip between A and B. $\quad a_B = a_A$

From Eq. (1), $\quad a_A = a_B = a_C = a$

From Eq. (5), $\quad a = \frac{W_C g}{W_A + W_B + W_C}$

For impending slip, $\quad F_{AB} = \mu_s N_{AB} = \mu_s W_B$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.31 (Continued)

Substituting into Eq. (6),

$$\frac{(W_B - W_C)(W_C g)}{W_A + W_B + W_C} = \mu_s W_B - W_C$$

Solving for W_C,

$$W_C = \frac{\mu_s W_B (W_A + W_B)}{W_A + 2W_B - \mu_s W_B}$$

$$= \frac{(0.30)(10)(20+10)}{20 + (2)(10) - (0.30)(10)}$$

$W_C = 2.43$ lbs ◀

(*b*) W_C increased by 10%. $W_C = 2.6757$ lbs

Since slip is occurring, $F_{AB} = \mu_k N_{AB} = \mu_k W_B$

Eq. (6) becomes $\frac{W_B}{g} a_B - \frac{W_C}{g} a_C = \mu_k W_B - W_C$

or $10a_B - 2.6757 a_C = [(0.25)(10) - 2.6757](32.2)$ (7)

With numerical data, Eq. (5) becomes

$$20a_A + 10a_B + 2.6757a_C = (2.6757)(32.2) \quad (8)$$

Solving Eqs. (1), (7), and (8) gives

$$a_A = 3.144 \text{ ft/s}^2, \quad a_B = 0.881 \text{ ft/s}^2, \quad a_C = 5.407 \text{ ft/s}^2$$

$\mathbf{a}_A = 3.14 \text{ ft/s}^2 \longrightarrow$ ◀

$\mathbf{a}_B = 0.881 \text{ ft/s}^2 \longrightarrow$ ◀

$\mathbf{a}_C = 5.41 \text{ ft/s}^2 \downarrow$ ◀

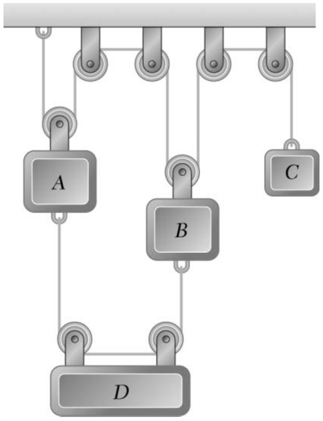
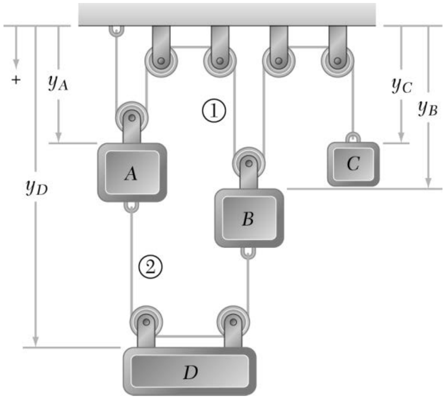
PROBLEM 12.32



The masses of blocks A, B, C and D are 9 kg, 9 kg, 6 kg and 7 kg, respectively. Knowing that a downward force of magnitude 120 N is applied to block D, determine (a) the acceleration of each block, (b) the tension in cord ABC. Neglect the weights of the pulleys and the effect of friction.

SOLUTION



Note: As shown, the system is in equilibrium.

From the diagram:

Cord 1: $$2y_A + 2y_B + y_C = \text{constant}$$

Then $$2v_A + 2v_B + v_C = 0$$

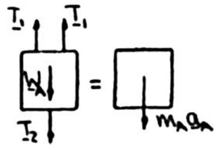
and $$2a_A + 2a_B + a_C = 0 \qquad (1)$$

Cord 2: $$(y_D - y_A) + (y_D - y_B) = \text{constant}$$

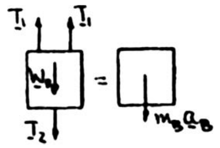
Then $$2v_D - v_A - v_B = 0$$

and $$2a_D - a_A - a_B = 0 \qquad (2)$$

A:



B:



(a) $+\downarrow \Sigma F_y = m_A a_A: \quad m_A g - 2T_1 + T_2 = m_A a_A$

or $$9(9.81) - 2T_1 + T_2 = 9a_A \qquad (3)$$

$+\downarrow \Sigma F_y = m_B a_B: \quad m_B g - 2T_1 + T_2 = m_B a_B$

or $$9(9.81) - 2T_1 + T_2 = 9a_B \qquad (4)$$

Note: Eqs. (3) and (4) $\Rightarrow \mathbf{a}_A = \mathbf{a}_B$

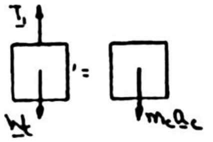
Then Eq. (1) $\Rightarrow a_C = -4a_A$

Eq. (2) $\Rightarrow a_D = a_A$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.32 (Continued)

C:



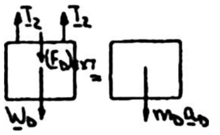
$$+\downarrow \Sigma F_y = m_C a_C: \quad m_C g - T_1 = m_C a_C$$

or $$T_1 = m_C(g - a_C) = 6(g + 4a_A) \qquad (5)$$

$$+\downarrow \Sigma F_y = m_D a_D: \quad m_D g - 2T_2 + (F_D)_{\text{ext}} = m_D a_D$$

or $$T_2 = \frac{1}{2}[m_D(g - a_D) + 120] = 94.335 - \frac{1}{2}(7a_A) \qquad (6)$$

D:



Substituting for T_1 [Eq. (5)] and T_2 [Eq. (6)] in Eq. (3)

$$9(9.81) - 2\times 6(g + 4a_A) + 94.335 - \frac{1}{2}(7a_A) = 9a_A$$

or $$a_A = \frac{9(9.81) - 2\times 6(9.81) + 94.335}{48 + 3.5 + 9} = 1.0728 \text{ m/s}^2$$

$$\mathbf{a}_A = \mathbf{a}_B = \mathbf{a}_D = 1.073 \text{ m/s}^2 \downarrow \blacktriangleleft$$

and $a_C = -4(1.0728 \text{ m/s}^2)$ or $\mathbf{a}_C = 4.29 \text{ m/s}^2 \uparrow \blacktriangleleft$

(*b*) Substituting into Eq. (5)

$T_1 = 6\big(9.81 + 4(1.0728)\big)$ or $T_1 = 84.6 \text{ N} \blacktriangleleft$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 12.33

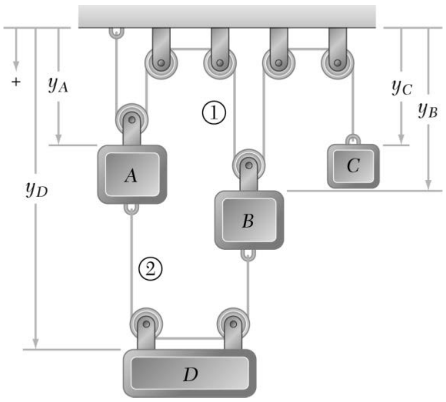
The masses of blocks A, B, C and D are 9 kg, 9 kg, 6 kg and 7 kg, respectively. Knowing that a downward force of magnitude 50 N is applied to block B and that the system starts from rest, determine at $t = 3$ s the velocity (a) of D relative to A, (b) of C relative to D. Neglect the weights of the pulleys and the effect of friction.

SOLUTION



Note: As shown, the system is in equilibrium.

From the constraint of the two cords,

Cord 1: $$2y_A + 2y_B + y_C = \text{constant}$$

Then $$2v_A + 2v_B + v_C = 0$$

and $$2a_A + 2a_B + a_C = 0 \qquad (1)$$

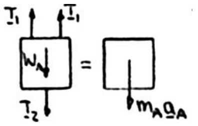
Cord 2: $$(y_D - y_A) + (y_D - y_B) = \text{constant}$$

Then $$2v_D - v_A - v_B = 0$$

and $$2a_D - a_A - a_B = 0 \qquad (2)$$

We determine the accelerations of blocks A, C, and D using the blocks as free bodies.

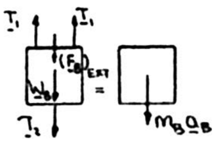
A:



$$+\!\downarrow \Sigma F_y = m_A a_A: \quad W_A - 2T_1 + T_2 = \frac{W_A}{g} a_A$$

or $$m_A g - 2T_1 + T_2 = m_A a_A \qquad (3)$$

B:



$$+\!\downarrow \Sigma F_y = m_B a_B: \quad W_B - 2T_1 + T_2 + (F_B)_{\text{ext}} = \frac{W_B}{g} a_B$$

or $$m_B g - 2T_1 + T_2 + (F_B)_{\text{ext}} = m_B a_B \qquad (4)$$

Forming $$(3) - (4) \Rightarrow -(F_B)_{\text{ext}} = 9(a_A - a_B)$$

or $$a_B = a_A + \frac{(F_B)_{\text{ext}}}{m_B}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.33 (Continued)

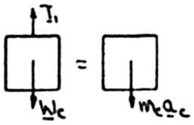
Then Eq. (1): $$2a_A + 2\left(a_A + \frac{(F_B)_{\text{ext}}}{m_g}\right) + a_C = 0$$

or $$a_C = -4a_A - \frac{2(F_B)_{\text{ext}}}{m_B}$$

Eq. (2): $$2a_D - a_A - \left(a_A + \frac{(F_B)_{\text{ext}}}{m_B}\right) = 0$$

or $$a_D = a_A + \frac{(F_B)_{\text{ext}}}{2m_B}$$

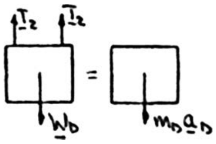
C:



$+\downarrow \Sigma F_y = m_C a_C$: $\quad W_C - T_1 = m_C a_C = m_C\left(-4a_A - \frac{2(F_B)_{\text{ext}}}{m_B}\right)$

or $$T_1 = m_C g + 4m_C a_A + \frac{2m_C(F_B)_{\text{ext}}}{m_B} \qquad (5)$$

D:



$+\downarrow \Sigma F_y = m_D a_D$: $\quad W_D - 2T_2 = m_D a_D$

or $$T_2 = \frac{1}{2} \times m_D\left[g - a_A - \frac{(F_B)_{\text{ext}}}{2m_B}\right] \qquad (6)$$

Substituting for T_1 [Eq. (5)] and T_2 [Eq. (6)] in Eq. (3)

$$m_A g - 2\left[m_C g + 4m_C a_A + \frac{2m_C(F_B)_{\text{ext}}}{m_B}\right] + \frac{1}{2} \times m_D\left[g - a_A - \frac{(F_B)_{\text{ext}}}{2m_B}\right] = m_A a_A$$

or $$a_A = \frac{m_A g - 2m_C g - \frac{4m_C(F_B)_{\text{ext}}}{m_B} - \frac{m_D(F_B)_{\text{ext}}}{4m_B} + \frac{m_D g}{2}}{m_A + 8m_C + \frac{m_D}{2}} = -2.2835 \text{ m/s}^2$$

Then $$a_C = -4(-2.2835 \text{ m/s}^2) - \frac{2(50)}{9} = -1.9771 \text{ m/s}^2$$

$$a_D = -2.2835 \text{ m/s}^2 + \frac{(50)}{2(9)} = 0.4943 \text{ m/s}^2$$

Note: We have uniformly accelerated motion, so that

$$v = 0 + at$$

(*a*) We have $$\mathbf{v}_{D/A} = \mathbf{v}_D - \mathbf{v}_A$$

or $$\mathbf{v}_{D/A} = a_D t - a_A t = [0.4943 - (-2.2835)] \text{ m/s}^2 \times 3 \text{ s}$$

or $$\mathbf{v}_{D/A} = 8.33 \text{ m/s} \downarrow \blacktriangleleft$$

(*b*) And $$\mathbf{v}_{C/D} = \mathbf{v}_C = \mathbf{v}_D$$

or $$\mathbf{v}_{C/D} = a_C t - a_D t = (-1.9771 - 0.4943) \text{ m/s}^2 \times 3 \text{ s}$$

or $$\mathbf{v}_{C/D} = 7.41 \text{ m/s} \uparrow \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.34

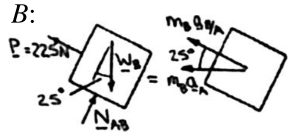
The 15-kg block B is supported by the 25-kg block A and is attached to a cord to which a 225-N horizontal force is applied as shown. Neglecting friction, determine (*a*) the acceleration of block A, (*b*) the acceleration of block B relative to A.

SOLUTION

(*a*) First we note $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, where $\mathbf{a}_{B/A}$ is directed along the inclined surface of A.

B: $\nwarrow^{+}\ \Sigma F_x = m_B a_x: \quad P - W_B \sin 25° = m_B a_A \cos 25° + m_B a_{B/A}$

B:



or $$225 - 15g \sin 25° = 15(a_A \cos 25° + a_{B/A})$$

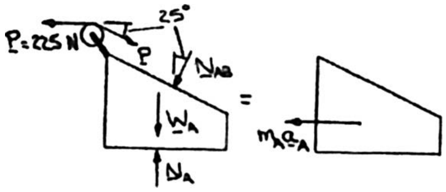
or $$15 - g \sin 25° = a_A \cos 25° + a_{B/A} \qquad (1)$$

$+\nearrow\ \Sigma F_y = m_B a_y: \quad N_{AB} - W_B \cos 25° = -m_B a_A \sin 25°$

or $$N_{AB} = 15(g \cos 25° - a_A \sin 25°)$$

A: $\overset{+}{\longleftarrow}\ \Sigma F_{x'} = m_A a_A: \quad P - P\cos 25° + N_{AB} \sin 25° = m_A a_A$

A:



or $$N_{AB} = [25a_A - 225(1 - \cos 25°)]/\sin 25°$$

Equating the two expressions for N_{AB}

$$15(g \cos 25° - a_A \sin 25°) = \frac{25a_A - 225(1 - \cos 25°)}{\sin 25°}$$

or $$a_A = \frac{3(9.81)\cos 25° \sin 25° + 45(1 - \cos 25°)}{5 + 3\sin^2 25°}$$

$$= 2.7979 \text{ m/s}^2$$

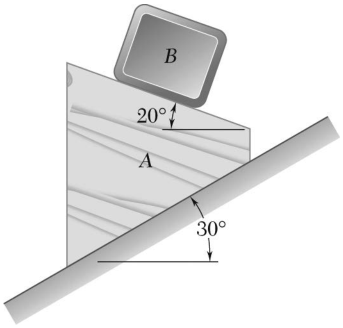
$\mathbf{a}_A = 2.80 \text{ m/s}^2 \longleftarrow$ ◀

(*b*) From Eq. (1)

$$a_{B/A} = 15 - (9.81)\sin 25° - 2.7979 \cos 25°$$

or $\mathbf{a}_{B/A} = 8.32 \text{ m/s}^2 \ \nwarrow 25°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

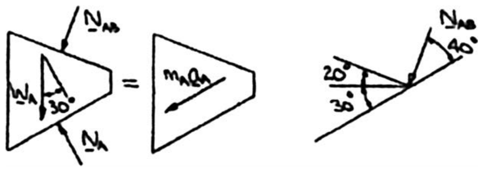


PROBLEM 12.35

Block B of mass 10-kg rests as shown on the upper surface of a 22-kg wedge A. Knowing that the system is released from rest and neglecting friction, determine (*a*) the acceleration of B, (*b*) the velocity of B relative to A at $t = 0.5$ s.

SOLUTION

A:

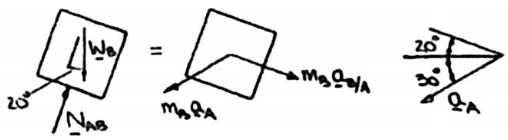


(*a*) $+\swarrow \Sigma F_x = m_A a_A: \quad W_A \sin 30° + N_{AB} \cos 40° = m_A a_A$

or
$$N_{AB} = \frac{22\left(a_A - \frac{1}{2} g\right)}{\cos 40°}$$

Now we note: $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, where $\mathbf{a}_{B/A}$ is directed along the top surface of A.

B:



$+\nearrow \Sigma F_{y'} = m_B a_{y'}: \quad N_{AB} - W_B \cos 20° = -m_B a_A \sin 50°$

or
$$N_{AB} = 10\,(g \cos 20° - a_A \sin 50°)$$

Equating the two expressions for N_{AB}

$$\frac{22\left(a_A - \frac{1}{2} g\right)}{\cos 40°} = 10(g \cos 20° - a_A \sin 50°)$$

or
$$a_A = \frac{(9.81)(1.1 + \cos 20° \cos 40°)}{2.2 + \cos 40° \sin 50°} = 6.4061 \text{ m/s}^2$$

$+\searrow \Sigma F_{x'} = m_B a_{x'}: \quad W_B \sin 20° = m_B a_{B/A} - m_B a_A \cos 50°$

or
$$a_{B/A} = g \sin 20° + a_A \cos 50°$$
$$= (9.81 \sin 20° + 6.4061 \cos 50°) \text{ m/s}^2$$
$$= 7.4730 \text{ m/s}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.36

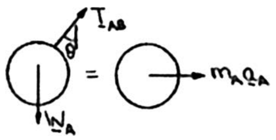
A 450-g tetherball A is moving along a horizontal circular path at a constant speed of 4 m/s. Determine (a) the angle θ that the cord forms with pole BC, (b) the tension in the cord.

SOLUTION



First we note $$a_A = a_n = \frac{v_A^2}{\rho}$$

where $$\rho = l_{AB} \sin\theta$$

(a) $+\uparrow \Sigma F_y = 0$: $T_{AB}\cos\theta - W_A = 0$

or $$T_{AB} = \frac{m_A g}{\cos\theta}$$

$\xrightarrow{+} \Sigma F_x = m_A a_A$: $T_{AB}\sin\theta = m_A \dfrac{v_A^2}{\rho}$

Substituting for T_{AB} and ρ

$$\frac{m_A g}{\cos\theta}\sin\theta = m_A \frac{v_A^2}{l_{AB}\sin\theta} \qquad \sin^2\theta = 1-\cos^2\theta$$

$$1-\cos^2\theta = \frac{(4\text{ m/s})^2}{1.8\text{ m}\times 9.81\text{ m/s}^2}\cos\theta$$

or $$\cos^2\theta + 0.906105\cos\theta - 1 = 0$$

Solving $$\cos\theta = 0.64479$$

or $$\theta = 49.9° \blacktriangleleft$$

(b) From above $$T_{AB} = \frac{m_A g}{\cos\theta} = \frac{0.450\text{ kg}\times 9.81\text{ m/s}^2}{0.64479}$$

or $$T_{AB} = 6.85\text{ N} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.38

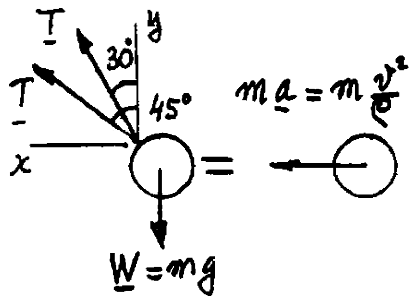
A single wire ACB passes through a ring at C attached to a sphere which revolves at a constant speed v in the horizontal circle shown. Knowing that the tension is the same in both portions of the wire, determine the speed v.

SOLUTION



$$\overset{+}{\leftarrow}\ \Sigma F_x = ma: \quad T(\sin 30° + \sin 45°) = \frac{mv^2}{\rho} \tag{1}$$

$$+\!\uparrow \Sigma F_y = 0: \quad T\,(\cos 30° + \cos 45°) - mg = 0$$

$$T\,(\cos 30° + \cos 45°) = mg \tag{2}$$

Divide Eq. (1) by Eq. (2):

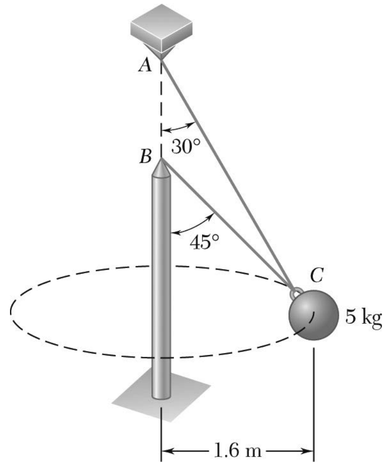
$$\frac{\sin 30° + \sin 45°}{\cos 30° + \cos 45°} = \frac{v^2}{\rho g}$$

$$v^2 = 0.76733\rho g = 0.76733\ (1.6\text{ m})(9.81\text{ m/s}^2) = 12.044\text{ m}^2/\text{s}^2$$

$v = 3.47$ m/s ◀

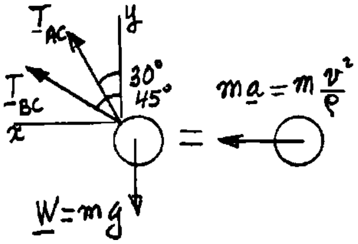
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.39



Two wires AC and BC are tied at C to a sphere which revolves at a constant speed v in the horizontal circle shown. Determine the range of values of v for which both wires remain taut.

SOLUTION



$\xleftarrow{+}$ $\Sigma F_x = ma$: $T_{AC}\sin 30° + T_{BC}\sin 45° = \dfrac{mv^2}{\rho}$ (1)

$+\uparrow$ $\Sigma F_y = 0$: $T_{AC}\cos 30° + T_{BC}\cos 45° - mg = 0$

$$T_{AC}\cos 30° + T_{BC}\cos 45° = mg \quad (2)$$

Divide Eq (1) by Eq. (2):

$$\frac{T_{AC}\sin 30° + T_{BC}\sin 45°}{T_{AC}\cos 30° + T_{BC}\cos 45°} = \frac{v^2}{\rho g} \quad (3)$$

When AC is slack, $T_{AC} = 0$.

Eq. (3) yields $v_1^2 = \rho g \tan 45° = (1.6 \text{ m})(9.81 \text{ m/s}^2)\tan 45° = 15.696 \text{ m}^2/\text{s}^2$

Wire AC will remain taut if $v \le v_1$, that is, if $v_1 = 3.96$ m/s $\qquad v \le 3.96$ m/s ◁

When BC is slack, $T_{BC} = 0$.

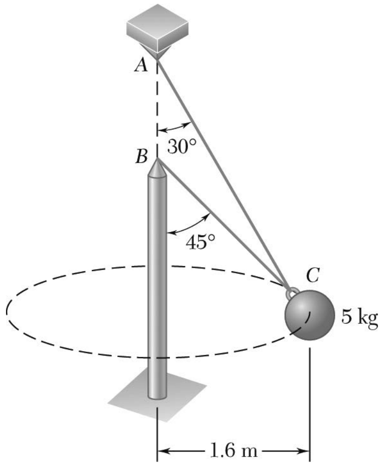
Eq. (3) yields $v_2^2 = \rho g \tan 30° = (1.6 \text{ m})(9.81 \text{ m/s}^2)\tan 30° = 9.0621 \text{ m}^2/\text{s}^2$

Wire BC will remain taut if $v \ge v_2$, that is, if $v_2 = 3.01$ m/s $\qquad v \ge 3.01$ m/s ◀

Combining the results obtained, we conclude that both wires remain taut for

$3.01 \text{ m/s} \le v \le 3.96 \text{ m/s}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.40

Two wires AC and BC are tied at C to a sphere which revolves at a constant speed v in the horizontal circle shown. Determine the range of the allowable values of v if both wires are to remain taut and if the tension in either of the wires is not to exceed 60 N.

SOLUTION

From the solution of Problem 12.39, we find that both wires remain taut for $3.01 \text{ m/s} \le v \le 3.96 \text{ m/s}$ ◁

To determine the values of v for which the tension in either wire will not exceed 60 N, we recall Eqs. (1) and (2) from Problem 12.39:

$$T_{AC} \sin 30° + T_{BC} \sin 45° = \frac{mv^2}{\rho} \tag{1}$$

$$T_{AC} \cos 30° + T_{BC} \cos 45° = mg \tag{2}$$

Subtract Eq. (1) from Eq. (2). Since sin 45° = cos 45°, we obtain

$$T_{AC} (\cos 30° - \sin 30°) = mg - \frac{mv^2}{\rho} \tag{3}$$

Multiply Eq. (1) by cos 30°, Eq. (2) by sin 30°, and subtract:

$$T_{BC} (\sin 45° \cos 30° - \cos 45° \sin 30°) = \frac{mv^2}{\rho} \cos 30° - mg \sin 30°$$

$$T_{BC} \sin 15° = \frac{mv^2}{\rho} \cos 30° - mg \sin 30° \tag{4}$$

Making $T_{AC} = 60$ N, $m = 5$ kg, $\rho = 1.6$ m, $g = 9.81 \text{ m/s}^2$ in Eq. (3), we find the value v_1 of v for which

$T_{AC} = 60$ N: $\quad 60(\cos 30° - \sin 30°) = 5(9.81) - \dfrac{5v_1^2}{1.6}$

$$21.962 = 49.05 - \frac{v_1^2}{0.32} \qquad v_1^2 = 8.668, \qquad v_1 = 2.94 \text{ m/s}$$

We have $T_{AC} \le 60$ N for $v \ge v_1$, that is, for $v \ge 2.94$ m/s ◁

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.40 (Continued)

Making $T_{BC} = 60$ N, $m = 5$ kg, $\rho = 1.6$ m, $g = 9.81$ m/s^2 in Eq. (4), we find the value v_2 of v for which

$T_{BC} = 60$ N:

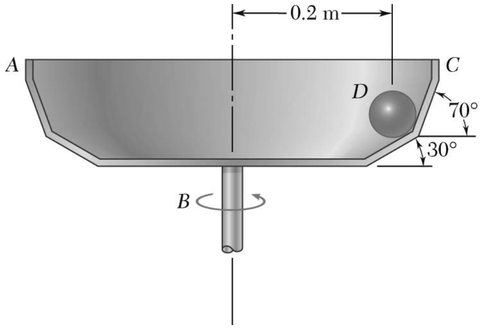
$$60 \sin 15° = \frac{5v_2^2}{1.6} \cos 30° - 5(9.81) \sin 30°$$

$$15.529 = 2.7063 v_2^2 - 24.523 \qquad v_2^2 = 14.80, \qquad v_2 = 3.85 \text{ m/s}$$

We have $T_{BC} \le 60$ N for $v \le v_2$, that is, for $v \le 3.85$ m/s ◁

Combining the results obtained, we conclude that the range of allowable value is $3.01 \text{ m/s} \le v \le 3.85 \text{ m/s}$ ◀

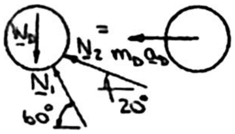
If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.41

A 100-g sphere D is at rest relative to drum ABC which rotates at a constant rate. Neglecting friction, determine the range of the allowable values of the velocity v of the sphere if neither of the normal forces exerted by the sphere on the inclined surfaces of the drum is to exceed 1.1 N.

SOLUTION



First we note $$a_D = a_n = \frac{v_D^2}{\rho}$$

where $$\rho = 0.2 \text{ m}$$

$$\overset{+}{\longleftarrow} \Sigma F_x = m_D a_D: \quad N_1 \cos 60° + N_2 \cos 20° = m_D \frac{v_D^2}{\rho} \tag{1}$$

$$+\uparrow \Sigma F_y = 0: \quad N_1 \sin 60° + N_2 \sin 20° - W_D = 0$$

or $$N_1 \sin 60° + N_2 \sin 20° = m_D g \tag{2}$$

<u>Case 1: N_1 is maximum.</u>

Let $$N_1 = 1.1 \text{ N}$$

Eq. (2) $$(1.1 \text{ N})\sin 60° + N_2 \sin 20° = (0.1 \text{ kg})\ (9.81 \text{ m/s}^2)$$

or $$N_2 = 0.082954 \text{ N}$$

$$(N_2)_{(N_1)_{\max}} < 1.1 \text{ N} \qquad \text{OK}$$

Eq. (1) $$(v_D^2)_{(N_1)_{\max}} = \frac{0.2 \text{ m}}{0.1 \text{ kg}}(1.1\cos 60° + 0.082954\cos 20°) \text{ N}$$

or $$(v_D)_{(N_1)_{\max}} = 1.121 \text{ m/s}$$

Now we form $$(\sin 20°) \times [\text{Eq. (1)}] - (\cos 20°) \times [\text{Eq. (2)}]$$

$$N_1 \cos 60° \sin 20° - N_1 \sin 60° \cos 20° = m_D \frac{v_D^2}{\rho} \sin 20° - m_D g \cos 20°$$

or $$-N_1 \sin 40° = m_D \frac{v_D^2}{\rho} \sin 20° - m_D g \cos 20°$$

$(v_D)_{\min}$ occurs when $N_1 = (N_1)_{\max}$

$(v_D)_{\min} = 1.121$ m/s

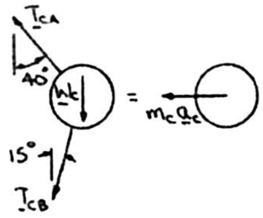
PROBLEM 12.42*

As part of an outdoor display, a 12-lb model C of the earth is attached to wires AC and BC and revolves at a constant speed v in the horizontal circle shown. Determine the range of the allowable values of v if both wires are to remain taut and if the tension in either of the wires is not to exceed 26 lb.

SOLUTION



First note $$a_C = a_n = \frac{v_C^2}{\rho}$$

where $$\rho = 3\text{ ft}$$

$$\overset{+}{\longleftarrow} \Sigma F_x = m_C a_C: \quad T_{CA}\sin 40° + T_{CB}\sin 15° = \frac{W_C}{g}\frac{v_C^2}{\rho} \tag{1}$$

$$+\uparrow \Sigma F_y = 0: \quad T_{CA}\cos 40° - T_{CB}\cos 15° - W_C = 0 \tag{2}$$

Note that Eq. (2) implies that

(*a*) when $T_{CB} = (T_{CB})_{\max}, \quad T_{CA} = (T_{CA})_{\max}$

(*b*) when $T_{CB} = (T_{CB})_{\min}, \quad T_{CA} = (T_{CA})_{\min}$

Case 1: T_{CA} is maximum.

Let $$T_{CA} = 26\text{ lb}$$

Eq. (2) $$(26\text{ lb})\cos 40° - T_{CB}\cos 15° - (12\text{ lb}) = 0$$

or $$T_{CB} = 8.1964\text{ lb}$$

$$(T_{CB})_{(T_{CA})_{\max}} < 26\text{ lb} \qquad \text{OK}$$

$$[(T_{CB})_{\max} = 8.1964\text{ lb}]$$

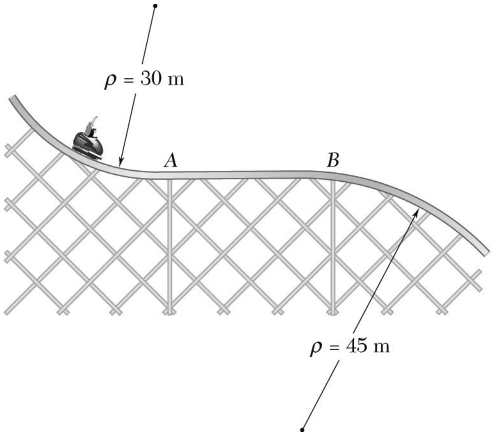
PROBLEM 12.47

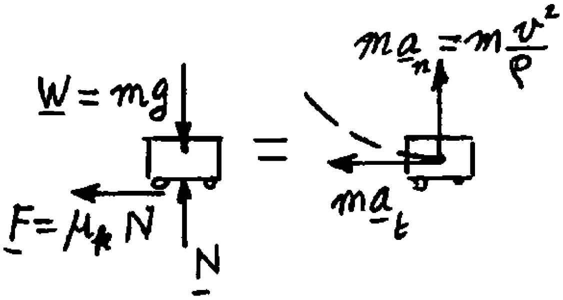


The roller-coaster track shown is contained in a vertical plane. The portion of track between *A* and *B* is straight and horizontal, while the portions to the left of *A* and to the right of *B* have radii of curvature as indicated. A car is traveling at a speed of 72 km/h when the brakes are suddenly applied, causing the wheels of the car to slide on the track ($\mu_k = 0.20$). Determine the initial deceleration of the car if the brakes are applied as the car (*a*) has almost reached *A*, (*b*) is traveling between *A* and *B*, (*c*) has just passed *B*.

SOLUTION

(*a*)

$$+\uparrow \Sigma F_n = ma_n: \quad N - mg = m\frac{v^2}{\rho}$$



$$N = m\left(g + \frac{v^2}{\rho}\right)$$

$$F = \mu_k N = \mu_k m\left(g + \frac{v^2}{\rho}\right)$$

$$\overset{+}{\longleftarrow} \Sigma F_t = ma_t: \quad F = ma_t$$

$$a_t = \frac{F}{m} = \mu_k\left(g + \frac{v^2}{\rho}\right)$$

Given data: $\mu_k = 0.20,\ v = 72 \text{ km/h} = 20 \text{ m/s}$

$$g = 9.81 \text{ m/s}^2, \quad \rho = 30 \text{ m}$$

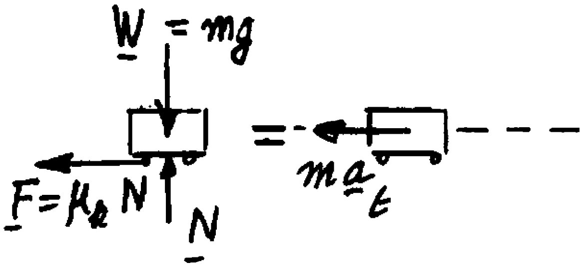
$$a_t = 0.20\left[9.81 + \frac{(20)^2}{30}\right]$$

$a_t = 4.63 \text{ m/s}^2$ ◀

(*b*) $a_n = 0$

$$+\uparrow \Sigma F_n = ma_n = 0: \quad N - mg = 0$$

$$N = mg$$



$$F = \mu_k N = \mu_k mg$$

$$\overset{+}{\longleftarrow} \Sigma F_t = ma_t: \quad F = ma_t$$

$$a_t = \frac{F}{m} = \mu_k g = 0.20(9.81)$$

$a_t = 1.962 \text{ m/s}^2$ ◀

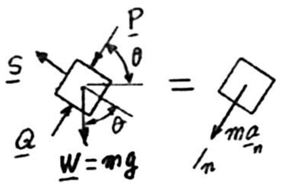
PROBLEM 12.48

A 250-g block fits inside a small cavity cut in arm OA, which rotates in the vertical plane at a constant rate such that $v = 3$ m/s. Knowing that the spring exerts on block B a force of magnitude $P = 1.5$ N and neglecting the effect of friction, determine the range of values of θ for which block B is in contact with the face of the cavity closest to the axis of rotation O.

SOLUTION

$$+\swarrow \Sigma F_n = ma_n: \quad P + mg\sin\theta - Q = m\frac{v^2}{\rho}$$



To have contact with the specified surface, we need $Q \geq 0$,

or $$Q = P + mg\sin\theta - \frac{mv^2}{\rho} > 0$$

$$\sin\theta > \frac{1}{g}\left(\frac{v^2}{\rho} - \frac{P}{m}\right) \qquad (1)$$

Data: $m = 0.250$ kg, $v = 3$ m/s, $P = 1.5$ N, $\rho = 0.9$ m

Substituting into (1):

$$\sin\theta > \frac{1}{9.81}\left[\frac{(3)^2}{0.9} - \frac{1.5}{0.25}\right]$$

$$\sin\theta > 0.40775$$

$$24.1° < \theta < 155.9° \blacktriangleleft$$

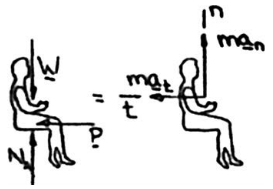
PROBLEM 12.50

A 54-kg pilot flies a jet trainer in a half vertical loop of 1200-m radius so that the speed of the trainer decreases at a constant rate. Knowing that the pilot's apparent weights at Points *A* and *C* are 1680 N and 350 N, respectively, determine the force exerted on her by the seat of the trainer when the trainer is at Point *B*.

SOLUTION

First we note that the pilot's apparent weight is equal to the vertical force that she exerts on the seat of the jet trainer.

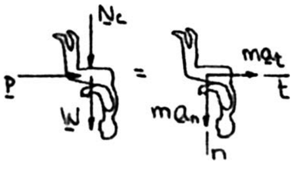
At *A*: $+\uparrow \Sigma F_n = ma_n$: $N_A - W = m\dfrac{v_A^2}{\rho}$



or $$v_A^2 = (1200\text{ m})\left(\frac{1680\text{ N}}{54\text{ kg}} - 9.81\text{ m/s}^2\right)$$

$$= 25{,}561.3\text{ m}^2/\text{s}^2$$

At *C*: $+\downarrow \Sigma F_n = ma_n$: $N_C + W = m\dfrac{v_C^2}{\rho}$



or $$v_C^2 = (1200\text{ m})\left(\frac{350\text{ N}}{54\text{ kg}} + 9.81\text{ m/s}^2\right)$$

$$= 19{,}549.8\text{ m}^2/\text{s}^2$$

Since $a_t = \text{constant},$ we have from *A* to *C*

$$v_C^2 = v_A^2 + 2a_t\ \Delta s_{AC}$$

or $$19{,}549.8\text{ m}^2/\text{s}^2 = 25{,}561.3\text{ m}^2/\text{s}^2 + 2a_t(\pi \times 1200\text{ m})$$

or $$a_t = -0.79730\text{ m/s}^2$$

Then from *A* to *B*

$$v_B^2 = v_A^2 + 2a_t\ \Delta s_{AB}$$

$$= 25{,}561.3\text{ m}^2/\text{s}^2 + 2(-0.79730\text{ m/s}^2)\left(\frac{\pi}{2} \times 1200\text{ m}\right)$$

$$= 22{,}555\text{ m}^2/\text{s}^2$$

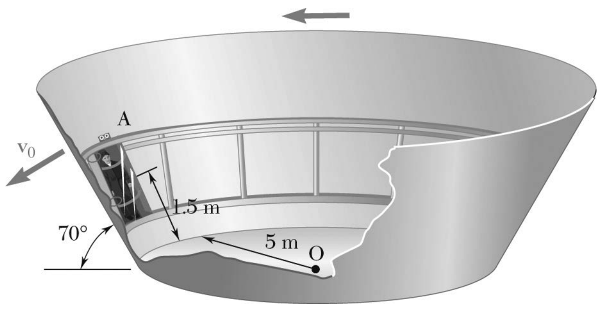
PROBLEM 12.51

A carnival ride is designed to allow the general public to experience high acceleration motion. The ride rotates about Point O in a horizontal circle such that the rider has a speed v_0. The rider reclines on a platform A which rides on rollers such that friction is negligible. A mechanical stop prevents the platform from rolling down the incline. Determine (*a*) the speed v_0 at which the platform A begins to roll upwards, (*b*) the normal force experienced by an 80-kg rider at this speed.



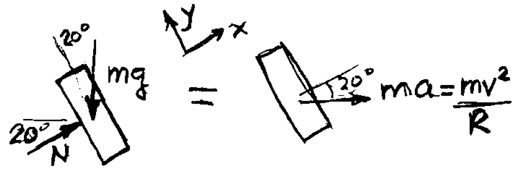
SOLUTION

Radius of circle: $R = 5 + 1.5\cos 70° = 5.513 \text{ m}$

$\Sigma \mathbf{F} = m\mathbf{a}$:

Components up the incline, ⦪70°:

$$-m_A g \cos 20° = -\frac{mv_0^2}{R}\sin 20°$$



(*a*) Speed v_0: $v_0 = \left[\dfrac{gR}{\tan 20°}\right]^{\frac{1}{2}} = \left[\dfrac{(9.81 \text{ m/s})(5.513 \text{ m})}{\tan 20°}\right]^{\frac{1}{2}} = 12.1898 \text{ m/s}$ $\qquad v_0 = 12.19 \text{ m/s}$ ◀

Components normal to the incline, ⦪ 20°.

$$N - mg\sin 20° = \frac{mv_0^2}{R}\cos 20°.$$

(*b*) Normal force: $N = (80)(9.81)\sin 20° + \dfrac{80(12.1898)^2}{5.513}\cos 20° = 2294 \text{ N}$ $\qquad N = 2290 \text{ N}$ ◀

PROBLEM 12.53

Tilting trains, such as the *American Flyer* which will run from Washington to New York and Boston, are designed to travel safely at high speeds on curved sections of track which were built for slower, conventional trains. As it enters a curve, each car is tilted by hydraulic actuators mounted on its trucks. The tilting feature of the cars also increases passenger comfort by eliminating or greatly reducing the side force $\mathbf{F}_s$ (parallel to the floor of the car) to which passengers feel subjected. For a train traveling at 100 mi/h on a curved section of track banked through an angle $\theta = 6°$ and with a rated speed of 60 mi/h, determine (*a*) the magnitude of the side force felt by a passenger of weight W in a standard car with no tilt ($\phi = 0$), (*b*) the required angle of tilt ϕ if the passenger is to feel no side force. (See Sample Problem 12.6 for the definition of rated speed.)

SOLUTION

Rated speed: $v_R = 60 \text{ mi/h} = 88 \text{ ft/s}, \;\; 100 \text{ mi/h} = 146.67 \text{ ft/s}$

From Sample Problem 12.6,

$$v_R^2 = g\rho \tan\theta$$

or

$$\rho = \frac{v_R^2}{g\tan\theta} = \frac{(88)^2}{32.2\tan 6°} = 2288 \text{ ft}$$

Let the *x*-axis be parallel to the floor of the car.

$$+\swarrow \Sigma F_x = ma_x: \quad F_s + W\sin(\theta+\phi) = ma_n\cos(\theta+\phi)$$

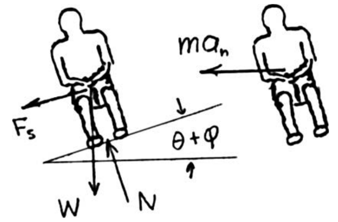
$$= \frac{mv^2}{\rho}\cos(\theta+\phi)$$

(*a*) $\phi = 0$.

$$F_s = W\left[\frac{v^2}{g\rho}\cos(\theta+\phi) - \sin(\theta+\phi)\right]$$

$$= W\left[\frac{(146.67)^2}{(32.2)(2288)}\cos 6° - \sin 6°\right]$$

$$= 0.1858W$$



$F_s = 0.1858W$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.53 (Continued)

(*b*) For $F_s = 0,$

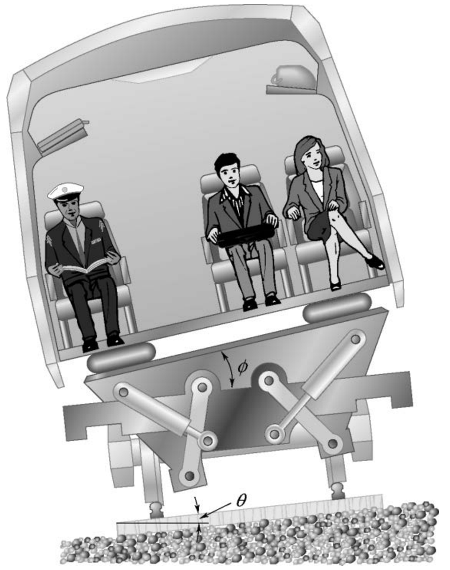
$$\frac{v^2}{g\rho}\cos(\theta+\phi) - \sin(\theta+\phi) = 0$$

$$\tan(\theta+\phi) = \frac{v^2}{g\rho} = \frac{(146.67)^2}{(32.2)(2288)} = 0.29199$$

$$\theta + \phi = 16.28°$$

$$\phi = 16.28° - 6° \qquad \phi = 10.28° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.54

Tests carried out with the tilting trains described in Problem 12.53 revealed that passengers feel queasy when they see through the car windows that the train is rounding a curve at high speed, yet do not feel any side force. Designers, therefore, prefer to reduce, but not eliminate, that force. For the train of Problem 12.53, determine the required angle of tilt ϕ if passengers are to feel side forces equal to 10% of their weights.

SOLUTION

Rated speed: $v_R = 60 \text{ mi/h} = 88 \text{ ft/s}, \; 100 \text{ mi/h} = 146.67 \text{ ft/s}$

From Sample Problem 12.6,

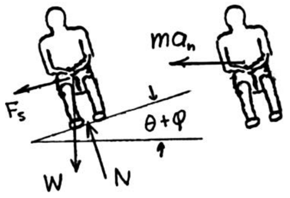
$$v_R^2 = g\rho \tan\theta$$

or
$$\rho = \frac{v_R^2}{g \tan\theta} = \frac{(88)^2}{32.2 \tan 6°} = 2288 \text{ ft}$$

Let the x-axis be parallel to the floor of the car.

$$+\swarrow \Sigma F_x = ma_x: \quad F_s + W\sin(\theta+\phi) = ma_n \cos(\theta+\phi)$$

$$= \frac{mv^2}{\rho}\cos(\theta+\phi)$$



Solving for F_s,
$$F_s = W\left[\frac{v^2}{g\rho}\cos(\theta+\phi) - \sin(\theta+\phi)\right]$$

Now
$$\frac{v^2}{g\rho} = \frac{(146.67)^2}{(32.2)(2288)} = 0.29199 \quad \text{and} \quad F_s = 0.10W$$

So that
$$0.10W = W[0.29199\cos(\theta+\phi) - \sin(\theta+\phi)]$$

Let
$$u = \sin(\theta+\phi)$$

Then
$$\cos(\theta+\phi) = \sqrt{1-u^2}$$

$$0.10 = 0.29199\sqrt{1-u^2} - u \quad \text{or} \quad 0.29199\sqrt{1-u^2} = 0.10 + u$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.54 (Continued)

Squaring both sides, $$0.08526(1-u^2) = 0.01 + 0.2u + u^2$$

or $$1.08526u^2 + 0.2u - 0.07526 = 0$$

The positive root of the quadratic equation is $u = 0.18685$

Then, $$\theta + \phi = \sin^{-1} u = 10.77°$$

$$\phi = 10.77° - 6°$$

$\phi = 4.77°$ ◀

PROBLEM 12.57

A turntable A is built into a stage for use in a theatrical production. It is observed during a rehearsal that a trunk B starts to slide on the turntable 10 s after the turntable begins to rotate. Knowing that the trunk undergoes a constant tangential acceleration of $0.24\ \text{m/s}^2$, determine the coefficient of static friction between the trunk and the turntable.

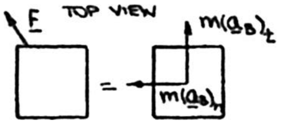
SOLUTION

First we note that $(a_B)_t =$ constant implies uniformly accelerated motion.

$$v_B = 0 + (a_B)_t t$$

At $t = 10$ s: $\quad v_B = (0.24\ \text{m/s}^2)(10\ \text{s}) = 2.4\ \text{m/s}$

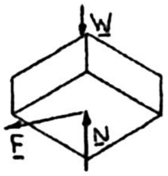
In the plane of the turntable



$$\Sigma \mathbf{F} = m_B \mathbf{a}_B: \quad \mathbf{F} = m_B(\mathbf{a}_B)_t + m_B(\mathbf{a}_B)_n$$

Then $\quad F = m_B\sqrt{(a_B)_t^2 + (a_B)_n^2}$

$$= m_B\sqrt{(a_B)_t^2 + \left(\frac{v_B^2}{\rho}\right)^2}$$



$$+\uparrow \Sigma F_y = 0: \quad N - W = 0$$

or $\quad N = m_B g$

At $t = 10$ s: $\quad F = \mu_s N = \mu_s m_B g$

Then $\quad \mu_s m_B g = m_B\sqrt{(a_B)_t^2 + \left(\frac{v_B^2}{\rho}\right)^2}$

or $\quad \mu_s = \dfrac{1}{9.81\ \text{m/s}^2}\left\{(0.24\ \text{m/s}^2)^2 + \left[\dfrac{(2.4\ \text{m/s})^2}{2.5\ \text{m}}\right]^2\right\}^{1/2}$

or $\quad \mu_s = 0.236$ ◀

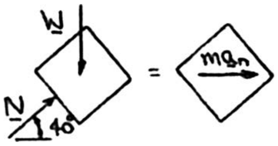
PROBLEM 12.58

A small, 300-g collar D can slide on portion AB of a rod which is bent as shown. Knowing that $\alpha = 40°$ and that the rod rotates about the vertical AC at a constant rate of 5 rad/s, determine the value of r for which the collar will not slide on the rod if the effect of friction between the rod and the collar is neglected.

SOLUTION



First note $$v_D = r\dot{\theta}_{ABC}$$

$$+\uparrow \Sigma F_y = 0: \quad N\sin 40° - W = 0$$

or $$N = \frac{mg}{\sin 40°}$$

$$\xrightarrow{+} \Sigma F_n = ma_n: \quad N\cos 40° = m\frac{v_D^2}{r}$$

or $$\frac{mg}{\sin 40°}\cos 40° = m\frac{(r\dot{\theta}_{ABC})^2}{r}$$

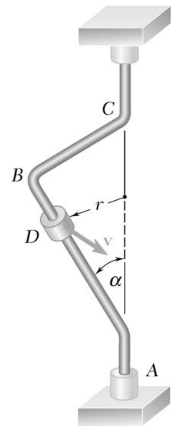
or $$r = \frac{g}{\dot{\theta}_{ABC}^2}\frac{1}{\tan 40°}$$

$$= \frac{9.81\ \text{m/s}^2}{(5\ \text{rad/s})^2}\frac{1}{\tan 40°}$$

$$= 0.468\ \text{m}$$

or $r = 468$ mm ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

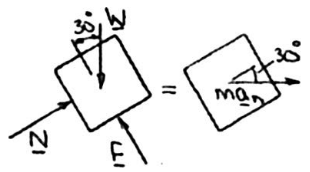


PROBLEM 12.59

A small, 200-g collar D can slide on portion AB of a rod which is bent as shown. Knowing that the rod rotates about the vertical AC at a constant rate and that $\alpha = 30°$ and $r = 600$ mm, determine the range of values of the speed v for which the collar will not slide on the rod if the coefficient of static friction between the rod and the collar is 0.30.

SOLUTION

Case 1: $v = v_{\min}$, impending motion downward



$$+\nearrow \Sigma F_x = ma_x: \quad N - W\sin 30° = m\frac{v^2}{r}\cos 30°$$

or
$$N = m\left(g\sin 30° + \frac{v^2}{r}\cos 30°\right)$$

$$+\nwarrow \Sigma F_y = ma_y: \quad F - W\cos 30° = -m\frac{v^2}{r}\sin 30°$$

or
$$F = m\left(g\cos 30° - \frac{v^2}{r}\sin 30°\right)$$

Now
$$F = \mu_s N$$

Then
$$m\left(g\cos 30° - \frac{v^2}{r}\sin 30°\right) = \mu_s \times m\left(g\sin 30° + \frac{v^2}{r}\cos 30°\right)$$

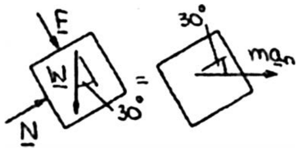
or
$$v^2 = gr\frac{1 - \mu_s \tan 30°}{\mu_s + \tan 30°}$$

$$= (9.81 \text{ m/s}^2)(0.6 \text{ m})\frac{1 - 0.3\tan 30°}{0.3 + \tan 30°}$$

or
$$v_{\min} = 2.36 \text{ m/s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Case 2: $v = v_{\max}$, impending motion upward



$$+\nearrow\ \Sigma F_x = ma_x:\quad N - W\sin 30° = m\frac{v^2}{r}\cos 30°$$

or

$$N = m\left(g\sin 30° + \frac{v^2}{r}\cos 30°\right)$$

$$+\searrow\ \Sigma F_y = ma_y:\quad F + W\cos 30° = m\frac{v^2}{r}\sin 30°$$

or

$$F = m\left(-g\cos 30° + \frac{v^2}{r}\sin 30°\right)$$

Now

$$F = \mu_s N$$

Then

$$m\left(-g\cos 30° + \frac{v^2}{r}\sin 30°\right) = \mu_s \times m\left(g\sin 30° + \frac{v^2}{r}\cos 30°\right)$$

or

$$v^2 = gr\frac{1 + \mu_s\tan 30°}{\tan 30° - \mu_s}$$

$$= (9.81\ \text{m/s}^2)(0.6\ \text{m})\frac{1 + 0.3\tan 30°}{\tan 30° - 0.3}$$

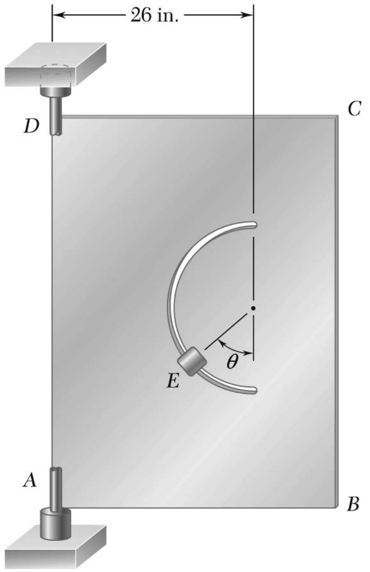
or

$$v_{\max} = 4.99\ \text{m/s}$$

For the collar not to slide

$$2.36\ \text{m/s} < v < 4.99\ \text{m/s}\ ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.60

A semicircular slot of 10-in. radius is cut in a flat plate which rotates about the vertical *AD* at a constant rate of 14 rad/s. A small, 0.8-lb block *E* is designed to slide in the slot as the plate rotates. Knowing that the coefficients of friction are $\mu_s = 0.35$ and $\mu_k = 0.25$, determine whether the block will slide in the slot if it is released in the position corresponding to (*a*) $\theta = 80°$, (*b*) $\theta = 40°$. Also determine the magnitude and the direction of the friction force exerted on the block immediately after it is released.

SOLUTION

First note

$$\rho = \frac{1}{12}(26 - 10\sin\theta)\ \text{ft}$$

$$v_E = \rho\dot{\phi}_{ABCD}$$

Then

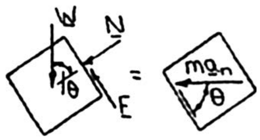
$$a_n = \frac{v_E^2}{\rho} = \rho(\dot{\phi}_{ABCD})^2$$

$$= \left[\frac{1}{12}(26 - 10\sin\theta)\ \text{ft}\right](14\ \text{rad/s})^2$$

$$= \frac{98}{3}(13 - 5\sin\theta)\ \text{ft/s}^2$$

Assume that the block is at rest with respect to the plate.

$$+\swarrow\ \Sigma F_x = ma_x: \quad N + W\cos\theta = m\frac{v_E^2}{\rho}\sin\theta$$



or

$$N = W\left(-\cos\theta + \frac{v_E^2}{g\rho}\sin\theta\right)$$

$$+\searrow\ \Sigma F_y = ma_y: \quad -F + W\sin\theta = -m\frac{v_E^2}{\rho}\cos\theta$$

or

$$F = W\left(\sin\theta + \frac{v_E^2}{g\rho}\cos\theta\right)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*a*) We have $\theta = 80°$

Then

$$N = (0.8\text{ lb})\left[-\cos 80° + \frac{1}{32.2\text{ ft/s}^2}\times\frac{98}{3}(13 - 5\sin 80°)\text{ ft/s}^2 \times \sin 80°\right]$$
$$= 6.3159\text{ lb}$$

$$F = (0.8\text{ lb})\left[\sin 80° + \frac{1}{32.2\text{ ft/s}^2}\times\frac{98}{3}(13 - 5\sin 80°)\text{ ft/s}^2 \times \cos 80°\right]$$
$$= 1.92601\text{ lb}$$

Now $F_{\max} = \mu_s N = 0.35(6.3159\text{ lb}) = 2.2106\text{ lb}$

The block does not slide in the slot, and

$\mathbf{F} = 1.926\text{ lb} \;\searrow 80°$ ◀

(*b*) We have $\theta = 40°$

Then

$$N = (0.8\text{ lb})\left[-\cos 40° + \frac{1}{32.2\text{ ft/s}^2}\times\frac{98}{3}(13 - 5\sin 40°)\text{ ft/s}^2 \times \sin 40°\right]$$
$$= 4.4924\text{ lb}$$

$$F = (0.8\text{ lb})\left[\sin 40° + \frac{1}{32.2\text{ ft/s}^2}\times\frac{98}{3}(13 - 5\sin 40°)\text{ ft/s}^2 \times \cos 40°\right]$$
$$= 6.5984\text{ lb}$$

Now $F_{\max} = \mu_s N,$ from which it follows that

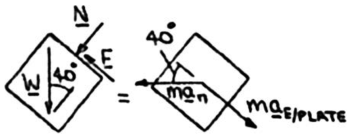
$$F > F_{\max}$$

Block E will slide in the slot

and
$$\mathbf{a}_E = \mathbf{a}_n + \mathbf{a}_{E/\text{plate}}$$
$$= \mathbf{a}_n + (\mathbf{a}_{E/\text{plate}})_t + (\mathbf{a}_{E/\text{plate}})_n$$

At $t = 0,$ the block is at rest relative to the plate, thus $(\mathbf{a}_{E/\text{plate}})_n = 0$ at $t = 0,$ so that $\mathbf{a}_{E/\text{plate}}$ must be directed tangentially to the slot.

$$+\swarrow \Sigma F_x = ma_x:\quad N + W\cos 40° = m\frac{v_E^2}{\rho}\sin 40°$$



or
$$N = W\left(-\cos 40° + \frac{v_E^2}{g\rho}\sin 40°\right) \quad \text{(as above)}$$
$$= 4.4924\text{ lb}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Sliding: $F = \mu_k N$

$= 0.25(4.4924 \text{ lb})$

$= 1.123 \text{ lb}$

Noting that **F** and $\mathbf{a}_{E/\text{plane}}$ must be directed as shown (if their directions are reversed, then $\Sigma \mathbf{F}_x$ is ↘ while $m\mathbf{a}_x$ is ↖), we have

the <u>block slides downward</u> in the slot and $\mathbf{F} = 1.123 \text{ lb} \measuredangle 40°$ ◀

<u>Alternative solutions</u>.

(*a*) Assume that the block is at rest with respect to the plate.

$$\Sigma \mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n$$

Then
$$\tan(\phi - 10°) = \frac{W}{ma_n} = \frac{W}{\frac{W}{g}\frac{v_E^2}{\rho}} = \frac{g}{\rho(\dot{\phi}_{ABCD})^2}$$

$$= \frac{32.2 \text{ ft/s}^2}{\frac{98}{3}(13 - 5\sin 80°) \text{ ft/s}^2} \qquad \text{(from above)}$$

or $\phi - 10° = 6.9588°$

and $\phi = 16.9588°$

Now $\tan\phi_s = \mu_s \quad \mu_s = 0.35$

so that $\phi_s = 19.29°$

$0 < \phi < \phi_s \Rightarrow$ Block does not slide and **R** is directed as shown.

Now
$$F = R\sin\phi \quad \text{and} \quad R = \frac{W}{\sin(\phi - 10°)}$$

Then
$$F = (0.8 \text{ lb})\frac{\sin 16.9588°}{\sin 6.9588°}$$

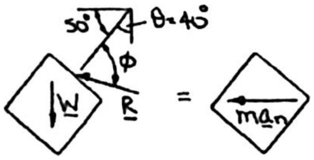
$= 1.926 \text{ lb}$

The <u>block does not slide</u> in the slot and $\mathbf{F} = 1.926 \text{ lb} \measuredangle 80°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.60 (Continued)

(*b*) Assume that the block is at rest with respect to the plate.



$$\Sigma \mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n$$

From Part *a* (above), it then follows that

$$\tan(\phi - 50°) = \frac{g}{\rho(\dot{\phi}_{ABCD})^2} = \frac{32.2 \text{ ft/s}^2}{\frac{98}{3}(13 - 5\sin 40°) \text{ ft/s}^2}$$

or $\phi - 50° = 5.752°$

and $\phi = 55.752°$

Now $\phi_s = 19.29°$

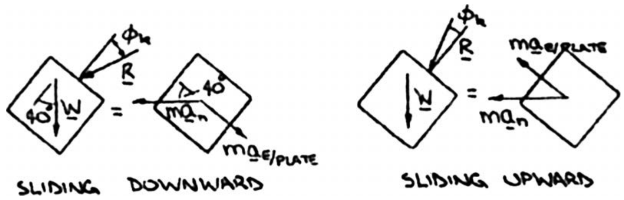
so that $\phi > \phi_s$

The block will slide in the slot and then

$$\phi = \phi_k, \quad \text{where} \quad \tan\phi_k = \mu_k \quad \mu_k = 0.25$$

or $\phi_k = 14.0362°$

To determine in which direction the block will slide, consider the free-body diagrams for the two possible cases.



Now $\Sigma \mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n + m\mathbf{a}_{E/\text{plate}}$

From the diagrams it can be concluded that this equation can be satisfied only if the block is sliding downward. Then

$$+\swarrow \Sigma F_x = ma_x: \quad W\cos 40° + R\cos\phi_k = m\frac{v_E^2}{\rho}\sin 40°$$

Now $F = R\sin\phi_k$

Then $$W\cos 40° + \frac{F}{\tan\phi_k} = \frac{W}{g}\frac{v_E^2}{\rho}\sin 40°$$

or $$F = \mu_k W\left(-\cos 40° + \frac{v_E^2}{g\rho}\sin 40°\right)$$

$$= 1.123 \text{ lb} \qquad \text{(see the first solution)}$$

The block slides downward in the slot and $\mathbf{F} = 1.123 \text{ lb} \measuredangle 40°$ ◀

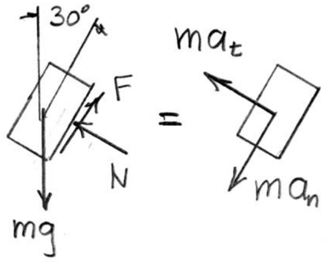
PROBLEM 12.61

A small block B fits inside a lot cut in arm OA which rotates in a vertical plane at a constant rate. The block remains in contact with the end of the slot closest to A and its speed is 1.4 m/s for $0 \le \theta \le 150°$. Knowing that the block begins to slide when $\theta = 150°$, determine the coefficient of static friction between the block and the slot.

SOLUTION

Draw the free body diagrams of the block B when the arm is at $\theta = 150°$.



$$\dot{v} = a_t = 0, \quad g = 9.81 \text{ m/s}^2$$

$$+\nwarrow \Sigma F_t = ma_t: \quad -mg\sin 30° + N = 0$$

$$N = mg\sin 30°$$

$$+\swarrow \Sigma F_n = ma_n: \quad mg\cos 30° - F = m\frac{v^2}{\rho}$$

$$F = mg\cos 30° - \frac{mv^2}{\rho}$$

Form the ratio $\frac{F}{N}$, and set it equal to μ_s for impending slip.

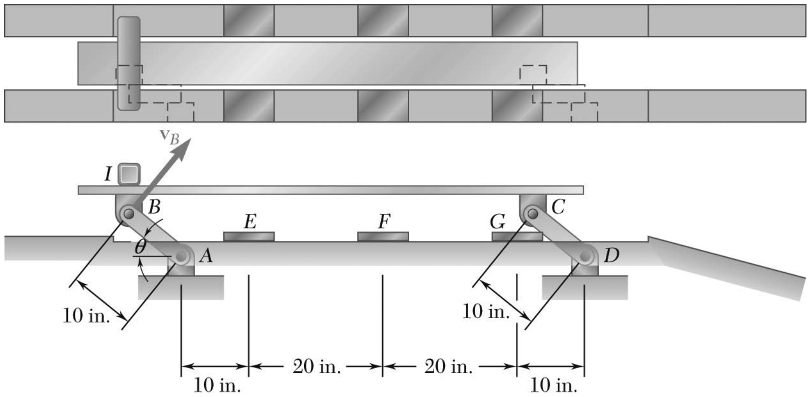
$$\mu_s = \frac{F}{N} = \frac{g\cos 30° - v^2/\rho}{g\sin 30°} = \frac{9.81\cos 30° - (1.4)^2/0.3}{9.81\sin 30°}$$

$$\mu_s = 0.400 \blacktriangleleft$$

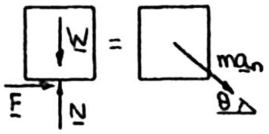
If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.62

The parallel-link mechanism *ABCD* is used to transport a component *I* between manufacturing processes at stations *E*, *F*, and *G* by picking it up at a station when $\theta = 0$ and depositing it at the next station when $\theta = 180°$. Knowing that member *BC* remains horizontal throughout its motion and that links *AB* and *CD* rotate at a constant rate in a vertical plane in such a way that $v_B = 2.2$ ft/s, determine (*a*) the minimum value of the coefficient of static friction between the component and *BC* if the component is not to slide on *BC* while being transferred, (*b*) the values of θ for which sliding is impending.



SOLUTION



$$\xrightarrow{+} \Sigma F_x = ma_x: \quad F = \frac{W}{g}\frac{v_B^2}{\rho}\cos\theta$$

$$+\uparrow \Sigma F_y = ma_y: \quad N - W = -\frac{W}{g}\frac{v_B^2}{\rho}\sin\theta$$

or

$$N = W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

Now

$$F_{\max} = \mu_s N = \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

and for the component not to slide

$$F < F_{\max}$$

or

$$\frac{W}{g}\frac{v_B^2}{\rho}\cos\theta < \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

or

$$\mu_s > \frac{\cos\theta}{\frac{g\rho}{v_B^2} - \sin\theta}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.62 (Continued)

We must determine the values of θ which maximize the above expression. Thus

$$\frac{d}{d\theta}\left(\frac{\cos\theta}{\frac{g\rho}{v_B^2}-\sin\theta}\right)=\frac{-\sin\theta\left(\frac{g\rho}{v_B^2}-\sin\theta\right)-(\cos\theta)(-\cos\theta)}{\left(\frac{g\rho}{v_B^2}-\sin\theta\right)^2}=0$$

or $\qquad \sin\theta=\dfrac{v_B^2}{g\rho} \qquad$ for $\qquad \mu_s=(\mu_s)_{\min}$

Now $\qquad \sin\theta=\dfrac{(2.2\text{ ft/s})^2}{(32.2\text{ ft/s}^2)\left(\frac{10}{12}\text{ ft}\right)}=0.180373$

or $\qquad \theta=10.3915° \quad$ and $\quad \theta=169.609°$

(*a*) From above,

$$(\mu_s)_{\min}=\frac{\cos\theta}{\frac{g\rho}{v_B^2}-\sin\theta} \quad \text{where} \quad \sin\theta=\frac{v_B^2}{g\rho}$$

$$(\mu_s)_{\min}=\frac{\cos\theta}{\frac{1}{\sin\theta}-\sin\theta}=\frac{\cos\theta\sin\theta}{1-\sin^2\theta}=\tan\theta$$

$$=\tan 10.3915°$$

or $\qquad (\mu_s)_{\min}=0.1834$ ◀

(*b*) We have impending motion

to the left for $\qquad \theta=10.39°$ ◀

to the right for $\qquad \theta=169.6°$ ◀

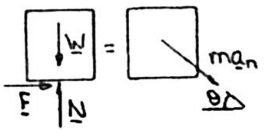
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.63

Knowing that the coefficients of friction between the component I and member BC of the mechanism of Problem 12.62 are $\mu_s = 0.35$ and $\mu_k = 0.25$, determine (a) the maximum allowable constant speed v_B if the component is not to slide on BC while being transferred, (b) the values of θ for which sliding is impending.

SOLUTION

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad F = \frac{W}{g}\frac{v_B^2}{\rho}\cos\theta$$



$$+\!\uparrow \Sigma F_y = ma_y: \quad N - W = -\frac{W}{g}\frac{v_B^2}{\rho}\sin\theta$$

or
$$N = W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

Now
$$F_{\max} = \mu_s N$$
$$= \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

and for the component not to slide

$$F < F_{\max}$$

or
$$\frac{W}{g}\frac{v_B^2}{\rho}\cos\theta < \mu_s W\left(1 - \frac{v_B^2}{g\rho}\sin\theta\right)$$

or
$$v_B^2 < \mu_s \frac{g\rho}{\cos\theta + \mu_s\sin\theta} \qquad (1)$$

To ensure that this inequality is satisfied, $\left(v_B^2\right)_{\max}$ must be less than or equal to the minimum value of $\mu_s g\rho/(\cos\theta + \mu_s\sin\theta)$, which occurs when $(\cos\theta + \mu_s\sin\theta)$ is maximum. Thus

$$\frac{d}{d\theta}(\cos\theta + \mu_s\sin\theta) = -\sin\theta + \mu_s\cos\theta = 0$$

or
$$\tan\theta = \mu_s$$
$$\mu_s = 0.35$$

or
$$\theta = 19.2900°$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*a*) The maximum allowed value of v_B is then

$$\left(v_B^2\right)_{\max} = \mu_s \frac{g\rho}{\cos\theta + \mu_s \sin\theta} \quad \text{where} \quad \tan\theta = \mu_s$$

$$= g\rho \frac{\tan\theta}{\cos\theta + (\tan\theta)\sin\theta} = g\rho \sin\theta$$

$$= (32.2 \text{ ft/s}^2)\left(\frac{10}{12}\text{ ft}\right)\sin 19.2900°$$

or $(v_B)_{\max} = 2.98$ ft/s ◀

(*b*) First note that for $90° < \theta < 180°$, Eq. (1) becomes

$$v_B^2 < \mu_s \frac{g\rho}{\cos\alpha + \mu_s \sin\alpha}$$

where $\alpha = 180° - \theta$. It then follows that the second value of θ for which motion is impending is

$$\theta = 180° - 19.2900°$$
$$= 160.7100°$$

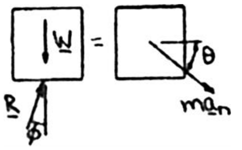
we have impending motion

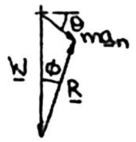
to the left for $\theta = 19.29°$ ◀

to the right for $\theta = 160.7°$ ◀

Alternative solution.

$$\Sigma\mathbf{F} = m\mathbf{a}: \quad \mathbf{W} + \mathbf{R} = m\mathbf{a}_n$$



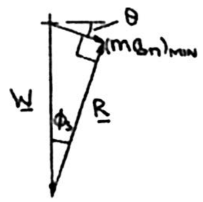


For impending motion, $\phi = \phi_s$. Also, as shown above, the values of θ for which motion is impending minimize the value of v_B, and thus the value of a_n is $\left(a_n = \frac{v_B^2}{\rho}\right)$. From the above diagram, it can be concluded that a_n is minimum when $m\mathbf{a}_n$ and $\mathbf{R}$ are perpendicular.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.63 (Continued)

Therefore, from the diagram



$$\theta = \phi_s = \tan^{-1} \mu_s \qquad \text{(as above)}$$

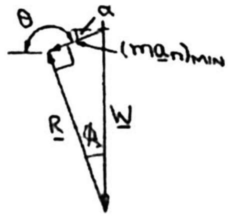
and $$ma_n = W \sin \phi_s$$

or $$m\frac{v_B^2}{\rho} = mg \sin \theta$$

or $$v_B^2 = g\rho \sin \theta \qquad \text{(as above)}$$

For $90° \le \theta \le 180°$, we have

from the diagram



$$\alpha = 180° - \theta \qquad \text{(as above)}$$

$$\alpha = \phi_s$$

and $$ma_n = W \sin \phi_s$$

or $$v_B^2 = g\rho \sin \theta \qquad \text{(as above)}$$

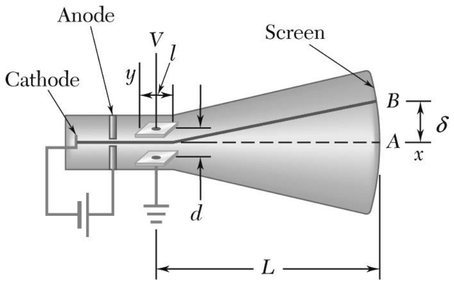
PROBLEM 12.64



In the cathode-ray tube shown, electrons emitted by the cathode and attracted by the anode pass through a small hole in the anode and then travel in a straight line with a speed v_0 until they strike the screen at A. However, if a difference of potential V is established between the two parallel plates, the electrons will be subjected to a force **F** perpendicular to the plates while they travel between the plates and will strike the screen at Point B, which is at a distance δ from A. The magnitude of the force **F** is $F = eV/d$, where $-e$ is the charge of an electron and d is the distance between the plates. Derive an expression for the deflection d in terms of V, v_0, the charge $-e$ and the mass m of an electron, and the dimensions d, ℓ, and L.

SOLUTION

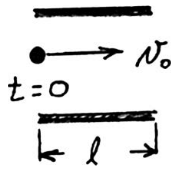
Consider the motion of one electron. For the horizontal motion, let $x = 0$ at the left edge of the plate and $x = \ell$ at the right edge of the plate. At the screen,

$$x = \frac{\ell}{2} + L$$

Horizontal motion: There are no horizontal forces acting on the electron so that $a_x = 0$.

Let $t_1 = 0$ when the electron passes the left edge of the plate, $t = t_1$ when it passes the right edge, and $t = t_2$ when it impacts on the screen. For uniform horizontal motion,

$$x = v_0 t,$$



so that

$$t_1 = \frac{\ell}{v_0}$$

and

$$t_2 = \frac{\ell}{2v_0} + \frac{L}{v_0}.$$

Vertical motion: The gravity force acting on the electron is neglected since we are interested in the deflection produced by the electric force. While the electron is between plates $(0 < t < t_1)$, the vertical force on the electron is $F_y = eV/d$. After it passes the plates $(t_1 < t < t_2)$, it is zero.

For $0 < t < t_1$, $\quad \Sigma F_y = ma_y: \quad a_y = \frac{F_y}{m} = \frac{eV}{md}$

$$v_y = (v_y)_0 + a_y t = 0 + \frac{eVt}{md}$$

$$y = y_0 + (v_y)_0 t + \frac{1}{2} a_y t^2 = 0 + 0 + \frac{eVt^2}{2md}$$

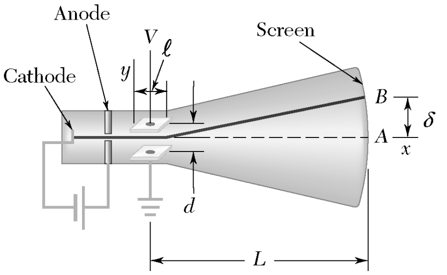
PROBLEM 12.65



In Problem 12.64, determine the smallest allowable value of the ratio d/ℓ in terms of e, m, v_0, and V if at $x = \ell$ the minimum permissible distance between the path of the electrons and the positive plate is $0.05d$.

Problem 12.64 In the cathode-ray tube shown, electrons emitted by the cathode and attracted by the anode pass through a small hole in the anode and then travel in a straight line with a speed v_0 until they strike the screen at A. However, if a difference of potential V is established between the two parallel plates, the electrons will be subjected to a force **F** perpendicular to the plates while they travel between the plates and will strike the screen at point B, which is at a distance δ from A. The magnitude of the force **F** is $F = eV/d$, where $-e$ is the charge of an electron and d is the distance between the plates. Derive an expression for the deflection d in terms of V, v_0, the charge $-e$ and the mass m of an electron, and the dimensions d, ℓ, and L.

SOLUTION

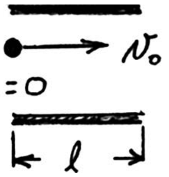
Consider the motion of one electron. For the horizontal motion, let $x = 0$ at the left edge of the plate and $x = \ell$ at the right edge of the plate. At the screen,

$$x = \frac{\ell}{2} + L$$

Horizontal motion: There are no horizontal forces acting on the electron so that $a_x = 0.$

Let $t_1 = 0$ when the electron passes the left edge of the plate, $t = t_1$ when it passes the right edge, and $t = t_2$ when it impacts on the screen. For uniform horizontal motion,

$$x = v_0 t,$$



so that

$$t_1 = \frac{\ell}{v_0}$$

and

$$t_2 = \frac{\ell}{2v_0} + \frac{L}{v_0}.$$

Vertical motion: The gravity force acting on the electron is neglected since we are interested in the deflection produced by the electric force. While the electron is between the plates $(0 < t < t_1)$, the vertical force on the electron is $F_y = eV/d.$ After it passes the plates $(t_1 < t < t_2)$, it is zero.

For $0 < t < t_1$, $\quad \Sigma F_y = ma_y$: $\quad a_y = \frac{F_y}{m} = \frac{eV}{md}$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.66

Rod *OA* rotates about *O* in a horizontal plane. The motion of the 0.5-lb collar *B* is defined by the relations $r = 10 + 6\cos\pi t$ and $\theta = \pi(4t^2 - 8t)$, where *r* is expressed in inches, *t* in seconds, and θ in radians. Determine the radial and transverse components of the force exerted on the collar when (*a*) $t = 0$, (*b*) $t = 0.5$ s.

SOLUTION

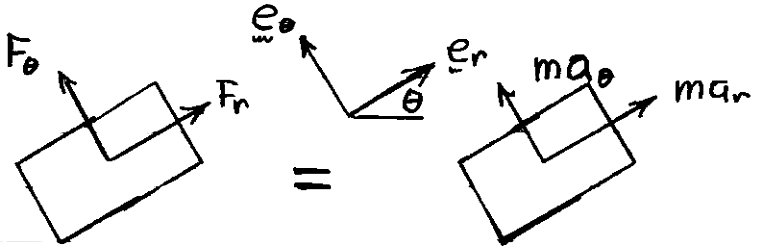
Use polar coordinates and calculate the derivatives of the coordinates *r* and θ with respect to time.

$$r = 10 + 6\cos\pi t \text{ in.} \qquad \theta = \pi(4t^2 - 8t) \text{ rad}$$

$$\dot{r} = -6\pi\sin\pi t \text{ in./s} \qquad \dot{\theta} = \pi(8t - 8) \text{ rad/s}$$

$$\ddot{r} = -6\pi^2\cos\pi t \text{ in./s}^2 \qquad \ddot{\theta} = 8\pi \text{ rad/s}^2$$

Mass of collar: $$m = \frac{0.5 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.015528 \text{ lb s}^2\text{/ft} = 1.294 \times 10^{-3} \text{ lb} \cdot \text{s}^2\text{/in.}$$



(*a*) $t = 0$:

$$r = 16 \text{ in.} \qquad \theta = 0$$

$$\dot{r} = 0 \qquad \dot{\theta} = -8\pi = -25.1327 \text{ rad/s}$$

$$\ddot{r} = -6\pi^2 = -59.218 \text{ in./s}^2 \qquad \ddot{\theta} = 8\pi = -25.1327 \text{ rad/s}^2$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = -59.218 - (16)(-25.1327)^2 = -10165.6 \text{ in./s}^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = (16)(25.1327) + 0 = 402.12 \text{ in./s}^2$$

$$F_r = ma_r = (1.294 \times 10^{-3} \text{ lb} \cdot \text{s}^2\text{/in.})(-10165.6 \text{ in./s}^2)$$

$F_r = -13.15$ lb ◀

$$F_\theta = ma_\theta = (1.294 \times 10^{-3} \text{ lb} \cdot \text{s}^2\text{/in.})(402.12 \text{ in./s}^2)$$

$F_\theta = 0.520$ lb ◀

$\theta = 0$ ◀

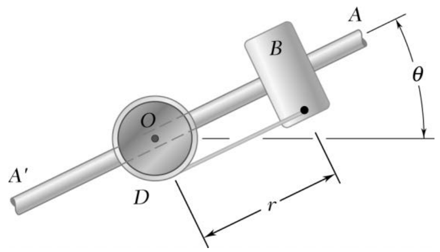
PROBLEM 12.68



The 3-kg collar B slides on the frictionless arm AA'. The arm is attached to drum D and rotates about O in a horizontal plane at the rate $\dot{\theta} = 0.75t$, where $\dot{\theta}$ and t are expressed in rad/s and seconds, respectively. As the arm-drum assembly rotates, a mechanism within the drum releases cord so that the collar moves outward from O with a constant speed of 0.5 m/s. Knowing that at t = 0, r = 0, determine the time at which the tension in the cord is equal to the magnitude of the horizontal force exerted on B by arm AA'.

SOLUTION

Kinematics

We have $\quad \dfrac{dr}{dt} = \dot{r} = 0.5 \text{ m/s}$

At $t = 0, r = 0$: $\quad \int_0^r dr = \int_0^t 0.5\, dt$

or $\quad r = (0.5t) \text{ m}$

Also, $\quad \ddot{r} = 0 \qquad \dot{\theta} = (0.75t) \text{ rad/s}$

$$\ddot{\theta} = 0.75 \text{ rad/s}^2$$

Now $\quad a_r = \ddot{r} - r\dot{\theta}^2 = 0 - [(0.5t) \text{ m}][(0.75t) \text{ rad/s}]^2 = -(0.28125t^3) \text{ m/s}^2$

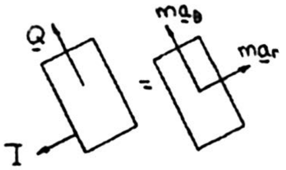
and $\quad a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$

$$= [(0.5t) \text{ m}][0.75 \text{ rad/s}^2] + 2(0.5 \text{ m/s})[(0.75t) \text{ rad/s}]$$

$$= (1.125t) \text{ m/s}^2$$

Kinetics

$+\nearrow \Sigma F_r = ma_r$: $\quad -T = (3 \text{ kg})(-0.28125t^3) \text{ m/s}^2$



or $\quad T = (0.84375t^3) \text{ N}$

$+\nwarrow \Sigma F_\theta = m_B a_\theta$: $\quad Q = (3 \text{ kg})(1.125t) \text{ m/s}^2$

or $\quad Q = (3.375t) \text{ N}$

Now require that $\quad T = Q$

or $\quad (0.84375t^3) \text{ N} = (3.375t) \text{ N}$

or $\quad t^2 = 4.000$

or $\quad t = 2.00 \text{ s}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.69

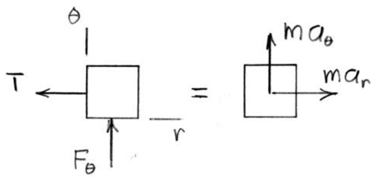
The horizontal rod *OA* rotates about a vertical shaft according to the relation $\dot{\theta} = 10t$, where $\dot{\theta}$ and t are expressed in rad/s and seconds, respectively. A 250-g collar *B* is held by a cord with a breaking strength of 18 N. Neglecting friction, determine, immediately after the cord breaks, (*a*) the relative acceleration of the collar with respect to the rod, (*b*) the magnitude of the horizontal force exerted on the collar by the rod.

SOLUTION



$$\dot{\theta} = 10t \text{ rad/s}, \quad \ddot{\theta} = 10 \text{ rad/s}^2$$

$$m = 250 \text{ g} = 0.250 \text{ kg}$$

Before cable breaks: $F_r = -T$ and $\ddot{r} = 0$.

$$F_r = ma_r: \quad -T = m(\ddot{r} - r\dot{\theta}^2)$$

$$mr\dot{\theta}^2 = m\ddot{r} + T \qquad \text{or} \qquad \dot{\theta}^2 = \frac{m\ddot{r} + T}{mr} = \frac{0 - 18}{(0.25)(0.5)} = 144 \text{ rad}^2/\text{s}^2$$

$$\dot{\theta} = 12 \text{ rad/s}$$

Immediately after the cable breaks: $F_r = 0$, $\dot{r} = 0$

(*a*) Acceleration of *B* relative to the rod.

$$m(\ddot{r} - r\dot{\theta}^2) = 0 \qquad \text{or} \qquad \ddot{r} = r\dot{\theta}^2 = (0.5)(12)^2 = 72 \text{ m/s}^2$$

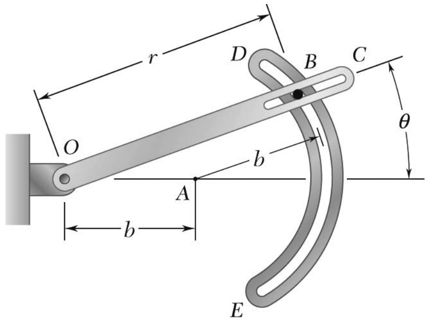
$$\mathbf{a}_{B/\text{rod}} = 72 \text{ m/s}^2 \text{ radially outward} \blacktriangleleft$$

(*b*) Transverse component of the force.

$$F_\theta = ma_\theta: \quad F_\theta = m(r\ddot{\theta} + 2\dot{r}\dot{\theta})$$

$$F_\theta = (0.250)[(0.5)(10) + (2)(0)(12)] = 1.25 \qquad F_\theta = 1.25 \text{ N} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.70

Pin B weighs 4 oz and is free to slide in a horizontal plane along the rotating arm OC and along the circular slot DE of radius $b = 20$ in. Neglecting friction and assuming that $\dot{\theta} = 15$ rad/s and $\ddot{\theta} = 250\text{ rad/s}^2$ for the position $\theta = 20°$, determine for that position (*a*) the radial and transverse components of the resultant force exerted on pin B, (*b*) the forces **P** and **Q** exerted on pin B, respectively, by rod OC and the wall of slot DE.

SOLUTION

Kinematics.

From the geometry of the system, we have

Then $\quad r = 2b\cos\theta \qquad \dot{r} = -(2b\sin\theta)\dot{\theta} \qquad \ddot{r} = -2b(\ddot{\theta}\sin\theta + \dot{\theta}^2\cos\theta)$

and $\quad a_r = \ddot{r} - r\dot{\theta}^2 = -2b(\ddot{\theta}\sin\theta + \dot{\theta}^2\cos\theta) - (2b\cos\theta)\dot{\theta}^2 = -2b(\ddot{\theta}\sin\theta + 2\dot{\theta}^2\cos\theta)$

Now $\quad = -2\left(\dfrac{20}{12}\text{ ft}\right)[(250\text{ rad/s}^2)\sin 20° + 2(15\text{ rad/s})^2\cos 20°] = -1694.56\text{ ft/s}^2$

and $\quad a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta} = (2b\cos\theta)\ddot{\theta} + 2(-2b\dot{\theta}\sin\theta)\dot{\theta} = 2b(\ddot{\theta}\cos\theta - 2\dot{\theta}^2\sin\theta)$

$$= 2\left(\frac{20}{12}\text{ ft}\right)[(250\text{ rad/s}^2)\cos 20° - 2(15\text{ rad/s})^2\sin 20°] = 270.05\text{ ft/s}^2$$

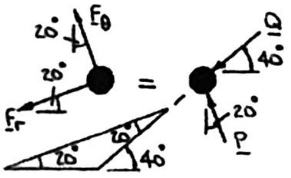
Kinetics.

(*a*) We have $\quad F_r = ma_r = \dfrac{\frac{1}{4}\text{ lb}}{32.2\text{ ft/s}^2}\times(-1694.56\text{ ft/s}^2) = -13.1565\text{ lb}$ $\qquad F_r = -13.16\text{ lb}$ ◀

and $\quad F_\theta = ma_\theta = \dfrac{\frac{1}{4}\text{ lb}}{32.2\text{ ft/s}^2}\times(270.05\text{ ft/s}^2) = 2.0967\text{ lb}$ $\qquad F_\theta = 2.10\text{ lb}$ ◀

(*b*) $\quad +\nearrow\ \Sigma F_r:\quad -F_r = -Q\cos 20°$

or $\quad Q = \dfrac{1}{\cos 20°}(13.1565\text{ lb}) = 14.0009\text{ lb}$



$+\nwarrow\ \Sigma F_\theta:\quad F_\theta = P - Q\sin 20°$

or $\quad P = (2.0967 + 14.0009\sin 20°)\text{ lb} = 6.89\text{ lb}$

$\mathbf{P} = 6.89\text{ lb} \searrow 70°$ ◀

$\mathbf{Q} = 14.00\text{ lb} \nearrow 40°$ ◀

PROBLEM 12.71

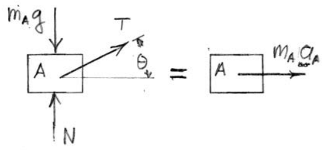
The two blocks are released from rest when $r = 0.8$ m and $\theta = 30°$. Neglecting the mass of the pulley and the effect of friction in the pulley and between block A and the horizontal surface, determine (*a*) the initial tension in the cable, (*b*) the initial acceleration of block A, (*c*) the initial acceleration of block B.

SOLUTION

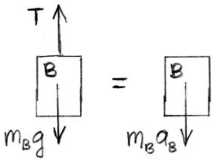
Let r and θ be polar coordinates of block A as shown, and let y_B be the position coordinate (positive downward, origin at the pulley) for the rectilinear motion of block B.

Constraint of cable: $r + y_B = \text{constant}$,

$$\dot{r} + v_B = 0, \quad \ddot{r} + a_B = 0 \qquad \text{or} \qquad \ddot{r} = -a_B \qquad (1)$$



For block A, $\xrightarrow{+} \Sigma F_x = m_A a_A$: $T\cos\theta = m_A a_A$ or $T = m_A a_A \sec\theta$ (2)



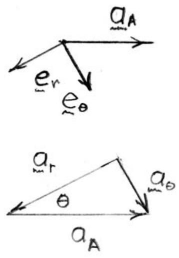
For block B, $+\downarrow \Sigma F_y = m_B a_B$: $m_B g - T = m_B a_B$ (3)

Adding Eq. (1) to Eq. (2) to eliminate T, $m_B g = m_A a_A \sec\theta + m_B a_B$ (4)

Radial and transverse components of $\mathbf{a}_A$.

Use either the scalar product of vectors or the triangle construction shown, being careful to note the positive directions of the components.

$$\ddot{r} - r\dot{\theta}^2 = a_r = \mathbf{a}_A \cdot \mathbf{e}_r = -a_A \cos\theta \qquad (5)$$



Noting that initially $\dot{\theta} = 0$, using Eq. (1) to eliminate $\ddot{r}$, and changing signs gives

$$a_B = a_A \cos\theta \qquad (6)$$

Substituting Eq. (6) into Eq. (4) and solving for a_A,

$$a_A = \frac{m_B g}{m_A \sec\theta + m_B \cos\theta} = \frac{(25)(9.81)}{20\sec 30° + 25\cos 30°} = 5.48 \text{ m/s}^2$$

From Eq. (6), $a_B = 5.48\cos 30° = 4.75 \text{ m/s}^2$

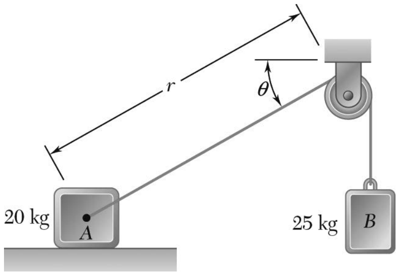
(*a*) From Eq. (2), $T = (20)(5.48)\sec 30° = 126.6$ $\quad T = 126.6 \text{ N}$ ◀

(*b*) Acceleration of block A. $\quad \mathbf{a}_A = 5.48 \text{ m/s}^2 \longrightarrow$ ◀

(*c*) Acceleration of block B. $\quad \mathbf{a}_B = 4.75 \text{ m/s}^2 \downarrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.72



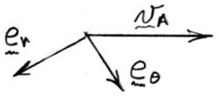
The velocity of block A is 2 m/s to the right at the instant when $r = 0.8$ m and $\theta = 30°$. Neglecting the mass of the pulley and the effect of friction in the pulley and between block A and the horizontal surface, determine, at this instant, (a) the tension in the cable, (b) the acceleration of block A, (c) the acceleration of block B.

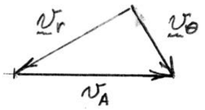
SOLUTION

Let r and θ be polar coordinates of block A as shown, and let y_B be the position coordinate (positive downward, origin at the pulley) for the rectilinear motion of block B.

Radial and transverse components of $\mathbf{v}_A$.

Use either the scalar product of vectors or the triangle construction shown, being careful to note the positive directions of the components.

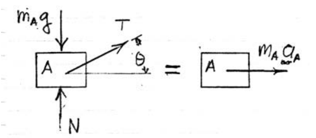




$$\dot{r} = v_r = \mathbf{v}_A \cdot \mathbf{e}_r = -v_A \cos 30°$$
$$= -2\cos 30° = -1.73205 \text{ m/s}$$

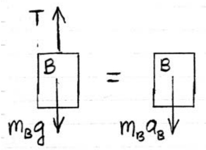
$$r\dot{\theta} = v_\theta = \mathbf{v}_A \cdot \mathbf{e}_\theta = -v_A \sin 30°$$
$$= 2\sin 30° = 1.000 \text{ m/s}^2$$

$$\dot{\theta} = \frac{v_\theta}{r} = \frac{1.000}{0.8} = 1.25 \text{ rad/s}$$



Constraint of cable: $r + y_B = \text{constant}$,

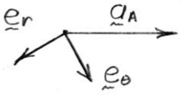
$$\dot{r} + v_B = 0, \quad \ddot{r} + a_B = 0 \quad \text{or} \quad \ddot{r} = -a_B \qquad (1)$$



For block A, $\xrightarrow{+} \Sigma F_x = m_A a_A : T\cos\theta = m_A a_A$ or $T = m_A a_A \sec\theta$ (2)

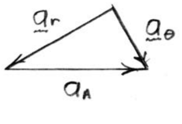
For block B, $+\downarrow \Sigma F_y = m_B a_B$: $m_B g - T = m_B a_B$ (3)

Adding Eq. (1) to Eq. (2) to eliminate T, $m_B g = m_A a_A \sec\theta + m_B a_B$ (4)



Radial and transverse components of $\mathbf{a}_A$.

Use a method similar to that used for the components of velocity.



$$\ddot{r} - r\dot{\theta}^2 = a_r = \mathbf{a}_A \cdot \mathbf{e}_r = -a_A \cos\theta \qquad (5)$$

Using Eq. (1) to eliminate $\ddot{r}$ and changing signs gives

$$a_B = a_A \cos\theta - r\dot{\theta}^2 \qquad (6)$$

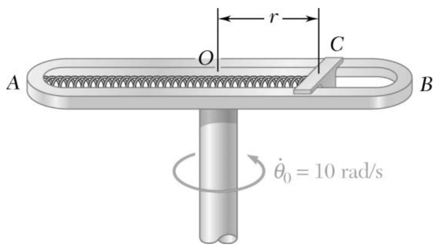
PROBLEM 12.73*



Slider C has a weight of 0.5 lb and may move in a slot cut in arm AB, which rotates at the constant rate $\dot{\theta}_0 = 10$ rad/s in a horizontal plane. The slider is attached to a spring of constant k = 2.5 lb/ft, which is unstretched when r = 0. Knowing that the slider is released from rest with no radial velocity in the position r = 18 in. and neglecting friction, determine for the position r = 12 in. (a) the radial and transverse components of the velocity of the slider, (b) the radial and transverse components of its acceleration, (c) the horizontal force exerted on the slider by arm AB.

SOLUTION

Let l_0 be the radial coordinate when the spring is unstretched. Force exerted by the spring.

$$F_r = -k(r - l_0)$$

$$\Sigma F_r = ma_r: \quad -k(r - l_0) = m(\ddot{r} - r\dot{\theta}^2)$$

$$\ddot{r} = \left(\dot{\theta}^2 - \frac{k}{m}\right)r + \frac{kl_0}{m} \tag{1}$$

But

$$\ddot{r} = \frac{d}{dt}(\dot{r}) = \frac{d\dot{r}}{dr}\frac{dr}{dt} = \dot{r}\frac{d\dot{r}}{dr}$$

$$\dot{r}d\dot{r} = \ddot{r}dr = \left[\left(\dot{\theta}^2 - \frac{k}{m}\right)r + \frac{kl_0}{m}\right]dr$$

Integrate using the condition $\dot{r} = \dot{r}_0$ when $r = r_0$.

$$\frac{1}{2}\dot{r}^2\Big|_{\dot{r}_0}^{\dot{r}} = \left[\frac{1}{2}\left(\dot{\theta}^2 - \frac{k}{m}\right)r^2 + \frac{kl_0}{m}r\right]\Bigg|_{r_0}^{r}$$

$$\frac{1}{2}\dot{r}^2 - \frac{1}{2}\dot{r}_0^2 = \frac{1}{2}\left(\dot{\theta}^2 - \frac{k}{m}\right)\left(r^2 - r_0^2\right) + \frac{kl_0}{m}(r - r_0)$$

$$\dot{r}^2 = \dot{r}_0^2 + \left(\dot{\theta}^2 - \frac{k}{m}\right)\left(r^2 - r_0^2\right) + \frac{2kl_0}{m}(r - r_0)$$

Data: $$m = \frac{W}{g} = \frac{0.5 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.01553 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\dot{\theta} = 10 \text{ rad/s}, \quad k = 2.5 \text{ lb/ft}, \quad l_0 = 0$$

$$\dot{r}_0 = (v_r)_0 = 0, \quad r_0 = 18 \text{ in.} = 1.5 \text{ ft}, \quad r = 12 \text{ in.} = 1.0 \text{ ft}$$

PROBLEM 12.74

A particle of mass m is projected from Point A with an initial velocity $\mathbf{v}_0$ perpendicular to line OA and moves under a central force $\mathbf{F}$ directed away from the center of force O. Knowing that the particle follows a path defined by the equation $r = r_0/\sqrt{\cos 2\theta}$ and using Eq. (12.27), express the radial and transverse components of the velocity $\mathbf{v}$ of the particle as functions of θ.

SOLUTION

Since the particle moves under a central force, $h = \text{constant}$.

Using Eq. (12.27),

$$h = r^2\dot{\theta} = h_0 = r_0 v_0$$

or

$$\dot{\theta} = \frac{r_0 v_0}{r^2} = \frac{r_0 v_0 \cos 2\theta}{r_0^{\,2}} = \frac{v_0}{r_0}\cos 2\theta$$

Radial component of velocity.

$$v_r = \dot{r} = \frac{dr}{d\theta}\dot{\theta} = \frac{d}{d\theta}\left(\frac{r_0}{\sqrt{\cos 2\theta}}\right)\dot{\theta} = r_0\frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\dot{\theta}$$

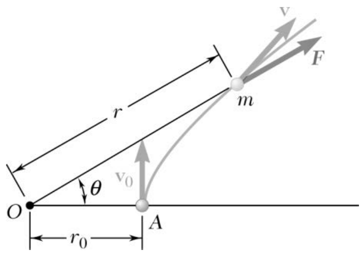
$$= r_0\frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\frac{v_0}{r}\cos 2\theta \qquad\qquad v_r = v_0\frac{\sin 2\theta}{\sqrt{\cos 2\theta}} \blacktriangleleft$$

Transverse component of velocity.

$$v_\theta = \frac{h}{r} = \frac{r_0 v_0}{r_0}\sqrt{\cos 2\theta} \qquad\qquad v_\theta = v_0\sqrt{\cos 2\theta} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.75



For the particle of Problem 12.74, show (*a*) that the velocity of the particle and the central force **F** are proportional to the distance r from the particle to the center of force O, (*b*) that the radius of curvature of the path is proportional to r^3.

PROBLEM 12.74 A particle of mass m is projected from Point A with an initial velocity $\mathbf{v}_0$ perpendicular to line OA and moves under a central force **F** directed away from the center of force O. Knowing that the particle follows a path defined by the equation $r = r_0/\sqrt{\cos 2\theta}$ and using Eq. (12.27), express the radial and transverse components of the velocity **v** of the particle as functions of θ.

SOLUTION

Since the particle moves under a central force, $h = \text{constant}$.

Using Eq. (12.27),

$$h = r^2\dot{\theta} = h_0 = r_0 v_0 \quad \text{or} \quad \dot{\theta} = \frac{r_0 v_0}{r^2} = \frac{r_0 v_0 \cos 2\theta}{r_0^2} = \frac{v_0}{r_0}\cos 2\theta$$

Differentiating the expression for r with respect to time,

$$\dot{r} = \frac{dr}{d\theta}\dot{\theta} = \frac{d}{d\theta}\left(\frac{r_0}{\sqrt{\cos 2\theta}}\right)\dot{\theta} = r_0\frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\dot{\theta} = r_0\frac{\sin 2\theta}{(\cos 2\theta)^{3/2}}\frac{v_0}{r_0}\cos 2\theta = v_0\frac{\sin 2\theta}{\sqrt{\cos 2\theta}}$$

Differentiating again,

$$\ddot{r} = \frac{d\dot{r}}{d\theta}\dot{\theta} = \frac{d}{d\theta}\left(v_0\frac{\sin 2\theta}{\sqrt{\cos 2\theta}}\right)\dot{\theta} = v_0\frac{2\cos^2 2\theta + \sin^2 2\theta}{(\cos 2\theta)^{3/2}}\dot{\theta} = \frac{v_0^2}{r_0}\frac{2\cos^2 2\theta + \sin^2 2\theta}{\sqrt{\cos 2\theta}}$$

(*a*) $\quad v_r = \dot{r} = v_0\dfrac{\sin 2\theta}{\sqrt{\cos 2\theta}} = \dfrac{v_0 r}{r_0}\sin 2\theta \qquad v_\theta = r\dot{\theta} = \dfrac{v_0 r}{r_0}\cos 2\theta$

$$v = \sqrt{(v_r)^2 + (v_\theta)^2} = \frac{v_0 r}{r_0}\sqrt{\sin^2 2\theta + \cos^2 2\theta} \qquad v = \frac{v_0 r}{r_0} \blacktriangleleft$$

$$a_r = \ddot{r} - r\dot{\theta}^2 = \frac{v_0^2}{r_0}\frac{2\cos^2 2\theta + \sin^2 2\theta}{\sqrt{\cos 2\theta}} - \frac{r_0}{\sqrt{\cos 2\theta}}\frac{v_0^2}{r_0^2}\cos^2 2\theta$$

$$= \frac{v_0^2}{r_0}\frac{\cos^2 2\theta + \sin^2 2\theta}{\sqrt{\cos 2\theta}} = \frac{v_0}{r_0\sqrt{\cos 2\theta}} = \frac{v_0^2 r}{r_0^2}$$

$$F_r = ma_r = \frac{mv_0^2 r}{r_0^2}: \qquad F_r = \frac{mv_0^2 r}{r_0^2} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.75 (Continued)

Since the particle moves under a central force, $a_\theta = 0.$

Magnitude of acceleration.

$$a = \sqrt{a_r^2 + a_\theta^2} = \frac{v_0^2 r}{r_0^2}$$

Tangential component of acceleration.

$$a_t = \frac{dv}{dt} = \frac{d}{dt}\left(\frac{v_0 r}{r_0}\right) = \frac{v_0}{r_0}\dot{r} = \frac{v_0^2 r}{r_0^2}\sin 2\theta$$

Normal component of acceleration.

$$a_t = \sqrt{a^2 - a_t^2} = \frac{v_0^2 r}{r_0^2}\sqrt{1 - \sin^2 2\theta} = \frac{v_0^2 r \cos 2\theta}{r_0^2}$$

But $\qquad \cos 2\theta = \left(\frac{r_0}{r}\right)^2$

Hence, $\qquad a_n = \frac{v_0^2}{r}$

(*b*) But $a_n = \frac{v^2}{\rho}$ or $\rho = \frac{v^2}{a_n} = \frac{v_0^2 r^2}{r_0^2} \cdot \frac{r}{v_0^2}$ $\qquad \rho = \frac{r^3}{r_0^2}$ ◀

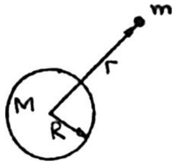
PROBLEM 12.78

Determine the mass of the earth knowing that the mean radius of the moon's orbit about the earth is 238,910 mi and that the moon requires 27.32 days to complete one full revolution about the earth.

SOLUTION

We have $$F = G\frac{Mm}{r^2} \quad \text{[Eq. (12.28)]}$$

and $$F = F_n = ma_n = m\frac{v^2}{r}$$



Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$M = \frac{r}{G}v^2$$

Now $$v = \frac{2\pi r}{\tau}$$

so that $$M = \frac{r}{G}\left(\frac{2\pi r}{\tau}\right)^2 = \frac{1}{G}\left(\frac{2\pi}{\tau}\right)^2 r^3$$

Noting that $$\tau = 27.32\,\text{days} = 2.3604\times 10^6\,\text{s}$$

and $$r = 238{,}910\ \text{mi} = 1.26144\times 10^9\,\text{ft}$$

we have $$M = \frac{1}{34.4\times 10^{-9}\,\text{ft}^4/\text{lb}\cdot\text{s}^4}\left(\frac{2\pi}{2.3604\times 10^6\,\text{s}}\right)^2 (1.26144\times 10^9\,\text{ft})^3$$

or $$M = 413\times 10^{21}\,\text{lb}\cdot\text{s}^2/\text{ft} \ \blacktriangleleft$$

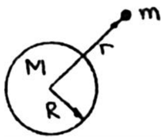
PROBLEM 12.79

Show that the radius r of the moon's orbit can be determined from the radius R of the earth, the acceleration of gravity g at the surface of the earth, and the time τ required for the moon to complete one full revolution about the earth. Compute r knowing that $\tau = 27.3$ days, giving the answer in both SI and U.S. customary units.

SOLUTION

We have $$F = G\frac{Mm}{r^2} \qquad \text{[Eq. (12.28)]}$$

and $$F = F_n = ma_n = m\frac{v^2}{r}$$



Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$v^2 = \frac{GM}{r}$$

Now $$GM = gR^2 \qquad \text{[Eq. (12.30)]}$$

so that $$v^2 = \frac{gR^2}{r} \quad \text{or} \quad v = R\sqrt{\frac{g}{r}}$$

For one orbit, $$\tau = \frac{2\pi r}{v} = \frac{2\pi r}{R\sqrt{\frac{g}{r}}}$$

or $$r = \left(\frac{g\tau^2 R^2}{4\pi^2}\right)^{1/3} \qquad \text{Q.E.D.}$$ ◀

Now $$\tau = 27.3 \text{ days} = 2.35872\times10^6 \text{ s}$$
$$R = 3960 \text{ mi} = 20.9088\times10^6 \text{ ft}$$

SI: $$r = \left[\frac{9.81 \text{ m/s}^2 \times (2.35872\times10^6 \text{ s})^2 \times (6.37\times10^6 \text{ m})^2}{4\pi^2}\right]^{1/3} = 382.81\times10^6 \text{ m}$$

or $$r = 383\times10^3 \text{ km}$$ ◀

U.S. customary units:

$$r = \left[\frac{32.2 \text{ ft/s}^2 \times (2.35872\times10^6 \text{ s})^2 \times (20.9088\times10^6 \text{ ft})^2}{4\pi^2}\right]^{1/3} = 1256.52\times10^6 \text{ ft}$$

or $$r = 238\times10^3 \text{ mi}$$ ◀

PROBLEM 12.80

Communication satellites are placed in a geosynchronous orbit, i.e., in a circular orbit such that they complete one full revolution about the earth in one sidereal day (23.934 h), and thus appear stationary with respect to the ground. Determine (*a*) the altitude of these satellites above the surface of the earth, (*b*) the velocity with which they describe their orbit. Give the answers in both SI and U.S. customary units.

SOLUTION

For gravitational force and a circular orbit,

$$|F_r| = \frac{GMm}{r^2} = \frac{mv^2}{r} \qquad \text{or} \qquad v = \sqrt{\frac{GM}{r}}$$

Let τ be the period time to complete one orbit.

But $$v\tau = 2\pi r \qquad \text{or} \qquad v^2\tau^2 = \frac{GM\tau^2}{r} = 4\pi^2 r^2$$

Then $$r^3 = \frac{GM\tau^2}{4\pi^2} \qquad \text{or} \qquad r = \left(\frac{GM\tau^2}{4\pi^2}\right)^{1/3}$$

<u>Data</u>: $$\tau = 23.934 \text{ h} = 86.1624\times10^3 \text{ s}$$

(*a*) In SI units: $$g = 9.81 \text{ m/s}^2, \quad R = 6.37\times10^6 \text{ m}$$

$$GM = gR^2 = (9.81)(6.37\times10^6)^2 = 398.06\times10^{12} \text{ m}^3/\text{s}^2$$

$$r = \left[\frac{(398.06\times10^{12})(86.1624\times10^3)^2}{4\pi^2}\right]^{1/3} = 42.145\times10^6 \text{ m}$$

altitude $h = r - R = 35.775\times10^6$ m $\qquad h = 35{,}800$ km ◀

In U.S. units: $$g = 32.2 \text{ ft/s}^2, \quad R = 3960 \text{ mi} = 20.909\times10^6 \text{ ft}$$

$$GM = gR^2 = (32.2)(20.909\times10^6)^2 = 14.077\times10^{15} \text{ ft}^3/\text{s}^2$$

$$r = \left[\frac{(14.077\times10^{15})(86.1624\times10^3)^2}{4\pi^2}\right]^{1/3} = 138.334\times10^6 \text{ ft}$$

altitude $h = r - R = 117.425\times10^6$ ft $\qquad h = 22{,}200$ mi ◀

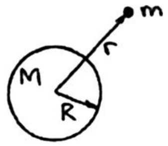
PROBLEM 12.81

Show that the radius r of the orbit of a moon of a given planet can be determined from the radius R of the planet, the acceleration of gravity at the surface of the planet, and the time τ required by the moon to complete one full revolution about the planet. Determine the acceleration of gravity at the surface of the planet Jupiter knowing that $R = 71{,}492$ km and that $\tau = 3.551$ days and $r = 670.9 \times 10^3$ km for its moon Europa.

SOLUTION



We have $$F = G\frac{Mm}{r^2} \qquad \text{[Eq. (12.28)]}$$

and $$F = F_n = ma_n = m\frac{v^2}{r}$$

Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$v^2 = \frac{GM}{r}$$

Now $$GM = gR^2 \qquad \text{[Eq. (12.30)]}$$

so that $$v^2 = \frac{gR^2}{r} \qquad \text{or} \qquad v = R\sqrt{\frac{g}{r}}$$

For one orbit, $$\tau = \frac{2\pi r}{v} = \frac{2\pi r}{R\sqrt{\frac{g}{r}}}$$

or $$r = \left(\frac{g\tau^2 R^2}{4\pi^2}\right)^{1/3} \qquad \text{Q.E.D.} \quad ◀$$

Solving for g, $$g = 4\pi^2 \frac{r^3}{\tau^2 R^2}$$

and noting that $\tau = 3.551\,\text{days} = 306{,}806$ s, then

$$g_{\text{Jupiter}} = 4\pi^2 \frac{r_{\text{Eur}}^3}{\tau_{\text{Eur}}^2 R_{\text{Jup}}}$$

$$= 4\pi^2 \frac{(670.9 \times 10^6\,\text{m})^3}{(306{,}806\,\text{s})^2 (71.492 \times 10^6\,\text{m})^2}$$

or $$g_{\text{Jupiter}} = 24.8\ \text{m/s}^2 \quad ◀$$

Note: $$g_{\text{Jupiter}} \approx 2.53 g_{\text{Earth}}$$

PROBLEM 12.82

The orbit of the planet Venus is nearly circular with an orbital velocity of 126.5×10^3 km/h. Knowing that the mean distance from the center of the sun to the center of Venus is 108×10^6 km and that the radius of the sun is 695×10^3 km, determine (*a*) the mass of the sun, (*b*) the acceleration of gravity at the surface of the sun.

SOLUTION

Let M be the mass of the sun and m the mass of Venus.

For the circular orbit of Venus,

$$\frac{GMm}{r^2} = ma_n = \frac{mv^2}{r} \qquad GM = rv^2$$

where r is radius of the orbit.

Data:

$$r = 108 \times 10^6 \text{ km} = 108 \times 10^9 \text{ m}$$

$$v = 126.5 \times 10^3 \text{ km/hr} = 35.139 \times 10^3 \text{ m/s}$$

$$GM = (108 \times 10^9)(35.139 \times 10^3)^2 = 1.3335 \times 10^{20} \text{ m}^3/\text{s}^2$$

(*a*) Mass of sun.

$$M = \frac{GM}{G} = \frac{1.3335 \times 10^{20} \text{ m}^3/\text{s}^2}{66.73 \times 10^{-12}}$$

$M = 1.998 \times 10^{30}$ kg ◀

(*b*) At the surface of the sun,

$$R = 695.5 \times 10^3 \text{ km} = 695.5 \times 10^6 \text{ m}$$

$$\frac{GMm}{R^2} = mg$$

$$g = \frac{GM}{R^2} = \frac{1.3335 \times 10^{20}}{(695.5 \times 10^6)^2}$$

$g = 276$ m/s^2 ◀

PROBLEM 12.83

A satellite is placed into a circular orbit about the planet Saturn at an altitude of 2100 mi. The satellite describes its orbit with a velocity of 54.7×10^3 mi/h. Knowing that the radius of the orbit about Saturn and the periodic time of Atlas, one of Saturn's moons, are 85.54×10^3 mi and 0.6017 days, respectively, determine (*a*) the radius of Saturn, (*b*) the mass of Saturn. (The *periodic time* of a satellite is the time it requires to complete one full revolution about the planet.)

SOLUTION

Velocity of Atlas.
$$v_A = \frac{2\pi r_A}{\tau_A}$$

where
$$v_A = 85.54\times10^3 \text{ mi} = 451.651\times10^6 \text{ ft}$$

and
$$\tau_A = 0.6017 \text{ days} = 51{,}987 \text{ s}$$

$$v_A = \frac{(2\pi)(451.651\times10^6)}{51{,}987} = 54.587\times10^3 \text{ ft/s}$$

Gravitational force.
$$F = \frac{GMm}{r^2} = \frac{mv^2}{r}$$

from which
$$GM = rv^2 = \text{constant}$$

For the satellite,
$$r_s v_s^2 = r_A v_A^2$$

$$r_s = \frac{r_A v_A^2}{v_s{}^2}$$

where
$$v_s = 54.7\times10^3 \text{mi/h} = 80.227\times10^3 \text{ ft/s}$$

$$r_s = \frac{(451.651\times10^6)(54.587\times10^3)^2}{(80.227\times10^3)^2} = 209.09\times10^6 \text{ ft}$$

$$r_s = 39{,}600 \text{ mi}$$

(*a*) Radius of Saturn.

$$R = r_s - (\text{altitude}) = 39{,}600 - 2100$$ $R = 37{,}500$ mi ◀

(*b*) Mass of Saturn.

$$M = \frac{r_A v_A^2}{G} = \frac{(451.651\times10^6)(54.587\times10^3)^2}{34.4\times10^{-9}}$$

$M = 39.1\times10^{24}\ \text{lb}\cdot\text{s}^2/\text{ft}$ ◀

PROBLEM 12.84

The periodic times (see Problem 12.83) of the planet Uranus's moons Juliet and Titania have been observed to be 0.4931 days and 8.706 days, respectively. Knowing that the radius of Juliet's orbit is 40,000 mi, determine (*a*) the mass of Uranus, (*b*) the radius of Titania's orbit.

SOLUTION

Velocity of Juliet.
$$v_J = \frac{2\pi r_J}{\tau_J}$$

where
$$r_J = 40{,}000 \text{ mi} = 2.112\times10^8 \text{ ft}$$

and
$$\tau_J = 0.4931 \text{ days} = 42{,}604 \text{ s}$$

$$v_J = \frac{(2\pi)(2.112\times10^8 \text{ ft})}{42{,}604 \text{ s}} = 3.11476\times10^4 \text{ ft/s}$$

Gravitational force.
$$F = \frac{GMm}{r^2} = \frac{mv^2}{r}$$

from which
$$GM = rv^2 = \text{constant}$$

(*a*) Mass of Uranus.
$$M = \frac{r_J v_J^2}{G}$$

$$M = \frac{(2.112\times10^8)(3.11476\times10^4)^2}{34.4\times10^{-9}}$$
$$= 5.95642\times10^{24} \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$M = 5.96\times10^{24} \text{ lb}\cdot\text{s}^2/\text{ft} \blacktriangleleft$$

(*b*) Radius of Titania's orbit.

$$GM = r_T v_T^2 = \frac{4\pi^2 r_T^3}{\tau_T{}^2} = \frac{4\pi^2 r_J^3}{\tau_J{}^2}$$

$$r_T^3 = r_J^3\left(\frac{\tau_T}{\tau_J}\right)^2 = (2.112\times10^8)^3\left(\frac{8.706}{0.4931}\right)^2 = 2.93663\times10^{27} \text{ ft}^3$$

$$r_T = 1.43202\times10^9 \text{ ft} = 2.71216\times10^5 \text{ mi} \qquad r_T = 2.71\times10^5 \text{ mi} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

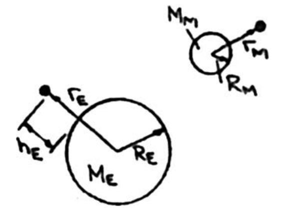
PROBLEM 12.85

A 500 kg spacecraft first is placed into a circular orbit about the earth at an altitude of 4500 km and then is transferred to a circular orbit about the moon. Knowing that the mass of the moon is 0.01230 times the mass of the earth and that the radius of the moon is 1737 km, determine (*a*) the gravitational force exerted on the spacecraft as it was orbiting the earth, (*b*) the required radius of the orbit of the spacecraft about the moon if the periodic times (see Problem 12.83) of the two orbits are to be equal, (*c*) the acceleration of gravity at the surface of the moon.

SOLUTION

First note that $R_E = 6.37\times10^6$ m

Then
$$r_E = R_E + h_E = (6.37\times10^6 + 4.5\times10^6)\text{ m} = 10.87\times10^6\text{ m}$$



(*a*) We have $F = \dfrac{GMm}{r^2}$ [Eq. (12.28)]

and $GM = gR^2$ [Eq. (12.29)]

Then $F = gR^2\dfrac{m}{r^2} = W\left(\dfrac{R}{r}\right)^2$

For the earth orbit,
$$F = (500\text{ kg})(9.81\text{ m/s}^2)\left(\frac{6.37\times10^6\text{ m}}{10.87\times10^6\text{ m}}\right)^2$$

or $F = 1684$ N ◀

(*b*) From the solution to Problem 12.78, we have

$$M = \frac{1}{G}\left(\frac{2\pi}{\tau}\right)^2 r^3$$

Then $\tau = \dfrac{2\pi r^{3/2}}{\sqrt{GM}}$

Now
$$\tau_E = \tau_M \Rightarrow \frac{2\pi r_E^{3/2}}{\sqrt{GM_E}} = \frac{2\pi r_M^{3/2}}{\sqrt{GM_M}} \qquad (1)$$

or
$$r_M = \left(\frac{M_M}{M_E}\right)^{1/3} r_E = (0.01230)^{1/3}(10.87\times10^6\text{ m})$$

or $r_M = 2.509\times10^6$ m $\qquad r_M = 2510$ km ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.85 (Continued)

(*c*) We have $GM = gR^2$ [Eq.(12.29)]

Substituting into Eq. (1)

$$\frac{2\pi r_E^{3/2}}{R_E\sqrt{g_E}} = \frac{2\pi r_M^{3/2}}{R_M\sqrt{g_M}}$$

or

$$g_M = \left(\frac{R_E}{R_M}\right)^2 \left(\frac{r_M}{r_E}\right)^3 g_E = \left(\frac{R_E}{R_M}\right)^2 \left(\frac{M_M}{M_E}\right) g_E$$

using the results of Part (b). Then

$$g_M = \left(\frac{6370 \text{ km}}{1737 \text{ km}}\right)^2 (0.01230)(9.81 \text{ m/s}^2)$$

or $g_{\text{moon}} = 1.62 \text{ m/s}^2$ ◀

Note: $g_{\text{moon}} \approx \frac{1}{6} g_{\text{earth}}$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.86

A space vehicle is in a circular orbit of 2200-km radius around the moon. To transfer it to a smaller circular orbit of 2080-km radius, the vehicle is first placed on an elliptic path *AB* by reducing its speed by 26.3 m/s as it passes through *A*. Knowing that the mass of the moon is 73.49×10^{21} kg, determine (*a*) the speed of the vehicle as it approaches *B* on the elliptic path, (*b*) the amount by which its speed should be reduced as it approaches *B* to insert it into the smaller circular orbit.

SOLUTION

For a circular orbit, $\Sigma F_n = ma_n: \quad F = m\dfrac{v^2}{r}$

Eq. (12.28): $$F = G\frac{Mm}{r^2}$$

Then $$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or $$v^2 = \frac{GM}{r}$$

Then $$(v_A)^2_{\text{circ}} = \frac{66.73\times10^{-12}\ \text{m}^3/\text{kg}\cdot\text{s}^2 \times 73.49\times10^{21}\ \text{kg}}{2200\times10^3\ \text{m}}$$

or $$(v_A)_{\text{circ}} = 1493.0\ \text{m/s}$$

and $$(v_B)^2_{\text{circ}} = \frac{66.73\times10^{-12}\ \text{m}^3/\text{kg}\cdot\text{s}^2 \times 73.49\times10^{21}\ \text{kg}}{2080\times10^3\ \text{m}}$$

or $$(v_B)_{\text{circ}} = 1535.5\ \text{m/s}$$

(*a*) We have
$$(v_A)_{TR} = (v_A)_{\text{circ}} + \Delta v_A$$
$$= (1493.0 - 26.3)\ \text{m/s}$$
$$= 1466.7\ \text{m/s}$$

Conservation of angular momentum requires that
$$r_A m(v_A)_{TR} = r_B m(v_B)_{TR}$$

or $$(v_B)_{TR} = \frac{2200\ \text{km}}{2080\ \text{km}} \times 1466.7\ \text{m/s}$$
$$= 1551.3\ \text{m/s}$$

or $$(v_B)_{TR} = 1551\ \text{m/s} \blacktriangleleft$$

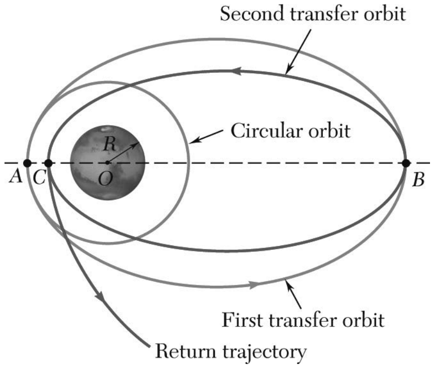
(*b*) Now $$(v_B)_{\text{circ}} = (v_B)_{TR} + \Delta v_B$$

or $$\Delta v_B = (1535.5 - 1551.3)\ \text{m/s}$$

or $$\Delta v_B = -15.8\ \text{m/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.87



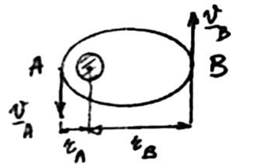
Plans for an unmanned landing mission on the planet Mars called for the earth-return vehicle to first describe a circular orbit at an altitude d_A = 2200 km above the surface of the planet with a velocity of 2771 m/s. As it passed through Point *A*, the vehicle was to be inserted into an elliptic transfer orbit by firing its engine and increasing its speed by $\Delta v_A = 1046$ m/s. As it passed through Point *B*, at an altitude d_B = 100,000 km, the vehicle was to be inserted into a second transfer orbit located in a slightly different plane, by changing the direction of its velocity and reducing its speed by $\Delta v_B = -22.0$ m/s. Finally, as the vehicle passed through Point *C*, at an altitude d_C = 1000 km, its speed was to be increased by $\Delta v_C = 660$ m/s to insert it into its return trajectory. Knowing that the radius of the planet Mars is $R = 3400$ km, determine the velocity of the vehicle after completion of the last maneuver.

SOLUTION

$$r_A = 3400 + 2200 = 5600 \text{ km} = 5.60 \times 10^6 \text{ m}$$
$$r_B = 3400 + 100,000 = 103,400 \text{ km} = 103.4 \times 10^6 \text{ m}$$
$$r_C = 3400 + 1000 = 4400 \text{ km} = 4.40 \times 10^6 \text{ m}$$

First transfer orbit.

$$v_A = 2771 \text{ m/s} + 1046 \text{ m/s} = 3817 \text{ m/s}$$

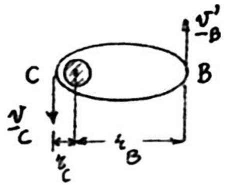


Conservation of angular momentum:

$$r_A m v_A = r_B m v_B$$
$$(5.60 \times 10^6)(3817) = (103.4 \times 10^6) v_B$$
$$v_B = 206.7 \text{ m/s}$$

Second transfer orbit.

$$v'_B = v_B + \Delta v_B$$
$$= 206.7 - 22.0 = 184.7 \text{ m/s}$$



Conservation of angular momentum:

$$r_B m v'_B = r_C m v_C$$
$$(103.4 \times 10^6)(184.7) = (4.40 \times 10^6) v_C$$
$$v_C = 4340 \text{ m/s}$$

After last maneuver.

$$v = v_C + \Delta v_C = 4340 + 660$$

$v = 5000$ m/s ◀

PROBLEM 12.88

To place a communications satellite into a geosynchronous orbit (see Problem 12.80) at an altitude of 22,240 mi above the surface of the earth, the satellite first is released from a space shuttle, which is in a circular orbit at an altitude of 185 mi, and then is propelled by an upper-stage booster to its final altitude. As the satellite passes through *A*, the booster's motor is fired to insert the satellite into an elliptic transfer orbit. The booster is again fired at *B* to insert the satellite into a geosynchronous orbit. Knowing that the second firing increases the speed of the satellite by 4810 ft/s, determine (*a*) the speed of the satellite as it approaches *B* on the elliptic transfer orbit, (*b*) the increase in speed resulting from the first firing at *A*.

SOLUTION

For earth, $R = 3960 \text{ mi} = 20.909\times10^6 \text{ ft}$

$$GM = gR^2 = (32.2)(20.909\times10^6)^2 = 14.077\times10^{15} \text{ ft}^3/\text{s}^2$$

$$r_A = 3960 + 185 = 4145 \text{ mi} = 21.8856\times10^6 \text{ ft}$$

$$r_B = 3960 + 22,240 = 26,200 \text{ mi} = 138.336\times10^6 \text{ ft}$$

<u>Speed on circular orbit through *A*</u>.

$$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{14.077\times10^{15}}{21.8856\times10^6}} = 25.362\times10^3 \text{ ft/s}$$

<u>Speed on circular orbit through *B*</u>.

$$(v_B)_{\text{circ}} = \sqrt{\frac{GM}{r_B}} = \sqrt{\frac{14.077\times10^{15}}{138.336\times10^6}} = 10.088\times10^3 \text{ ft/s}$$

PROBLEM 12.88 (Continued)

(*a*) Speed on transfer trajectory at *B*.

$$(v_B)_{\text{tr}} = 10.088\times 10^3 - 4810$$

$$= 5.278\times 10^3$$

5280 ft/s ◀

Conservation of angular momentum for transfer trajectory.

$$r_A(v_A)_{\text{tr}} = r_B(v_B)_{\text{tr}}$$

$$(v_A)_{\text{tr}} = \frac{r_B(v_B)_{\text{tr}}}{r_A}$$

$$= \frac{(138.336\times 10^6)(5278)}{21.8856\times 10^6}$$

$$= 33.362\times 10^3 \text{ ft/s}$$

(*b*) Change in speed at *A*.

$$\Delta v_A = (v_A)_{\text{tr}} - (v_A)_{\text{circ}}$$

$$= 33.362\times 10^3 - 25.362\times 10^3$$

$$= 8.000\times 10^3$$

$\Delta v_A = 8000$ ft/s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 12.89

A space shuttle S and a satellite A are in the circular orbits shown. In order for the shuttle to recover the satellite, the shuttle is first placed in an elliptic path BC by increasing its speed by $\Delta v_B = 280$ ft/s as it passes through B. As the shuttle approaches C, its speed is increased by $\Delta v_C = 260$ ft/s to insert it into a second elliptic transfer orbit CD. Knowing that the distance from O to C is 4289 mi, determine the amount by which the speed of the shuttle should be increased as it approaches D to insert it into the circular orbit of the satellite.

SOLUTION

First note
$$R = 3960 \text{ mi} = 20.9088 \times 10^6 \text{ ft}$$
$$r_A = (3960 + 380) \text{ mi} = 4340 \text{ mi} = 22.9152 \times 10^6 \text{ ft}$$
$$r_B = (3960 + 180) \text{ mi} = 4140 \text{ mi} = 21.8592 \times 10^6 \text{ ft}$$

For a circular orbit,
$$\Sigma F_n = ma_n: \qquad F = m\frac{v^2}{r}$$

Eq. (12.28):
$$F = G\frac{Mm}{r^2}$$

Then
$$G\frac{Mm}{r^2} = m\frac{v^2}{r}$$

or
$$v^2 = \frac{GM}{r} = \frac{gR^2}{r} \qquad \text{using Eq. (12.29).}$$

Then
$$(v_A)^2_{\text{circ}} = \frac{32.2 \text{ ft/s}^2 \times (20.9088 \times 10^6 \text{ ft})^2}{22.9152 \times 10^6 \text{ ft}}$$

or
$$(v_A)_{\text{circ}} = 24{,}785 \text{ ft/s}$$

and
$$(v_B)^2_{\text{circ}} = \frac{32.2 \text{ ft/s}^2 \times (20.9088 \times 10^6 \text{ ft})^2}{21.8592 \times 10^6 \text{ ft}}$$

or
$$(v_B)_{\text{circ}} = 25{,}377 \text{ ft/s}$$

We have
$$(v_B)_{TR_{BC}} = (v_B)_{\text{circ}} + \Delta v_B = (25{,}377 + 280) \text{ ft/s}$$
$$= 25{,}657 \text{ ft/s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.89 (Continued)

Conservation of angular momentum requires that

$$BC: \quad r_B\, m(v_B)_{TR_{BC}} = r_C\, m(v_C)_{TR_{BC}} \tag{1}$$

$$CD: \quad r_C\, m(v_C)_{TR_{CD}} = r_A\, m(v_D)_{TR_{CD}} \tag{2}$$

From Eq. (1)

$$(v_C)_{TR_{BC}} = \frac{r_B}{r_C}(v_B)_{TR_{BC}} = \frac{4140 \text{ mi}}{4289 \text{ mi}} \times 25{,}657 \text{ ft/s}$$
$$= 24{,}766 \text{ ft/s}$$

Now

$$(v_C)_{TR_{CD}} = (v_C)_{TR_{BC}} + \Delta v_C = (24{,}766 + 260) \text{ ft/s}$$
$$= 25{,}026 \text{ ft/s}$$

From Eq. (2)

$$(v_D)_{TR_{CD}} = \frac{r_C}{r_A}(v_C)_{TR_{CD}} = \frac{4289 \text{ mi}}{4340 \text{ mi}} \times 25{,}026 \text{ ft/s}$$
$$= 24{,}732 \text{ ft/s}$$

Finally,

$$(v_A)_{\text{circ}} = (v_D)_{TR_{CD}} + \Delta v_D$$

or

$$\Delta v_D = (24{,}785 - 24{,}732) \text{ ft/s}$$

or

$$\Delta v_D = 53 \text{ ft/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 12.90

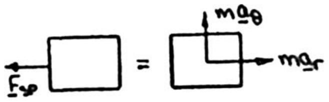
A 1 kg collar can slide on a horizontal rod, which is free to rotate about a vertical shaft. The collar is initially held at A by a cord attached to the shaft. A spring of constant 30 N/m is attached to the collar and to the shaft and is undeformed when the collar is at A. As the rod rotates at the rate $\dot{\theta} = 16$ rad/s, the cord is cut and the collar moves out along the rod. Neglecting friction and the mass of the rod, determine (a) the radial and transverse components of the acceleration of the collar at A, (b) the acceleration of the collar relative to the rod at A, (c) the transverse component of the velocity of the collar at B.

SOLUTION

First note $\qquad F_{sp} = k(r - r_A)$



(a) $\quad F_\theta = 0$ and at A, $\qquad F_r = -F_{sp} = 0$

$(a_A)_r = 0$ ◀

$(a_A)_\theta = 0$ ◀

(b) $\quad \xrightarrow{+} \Sigma F_r = ma_r$: $\qquad -F_{sp} = m(\ddot{r} - r\dot{\theta}^2)$

Noting that $\qquad a_{\text{collar/rod}} = \ddot{r}$, $\quad$ we have at A

$$0 = m[a_{\text{collar/rod}} - (150 \text{ mm})(16 \text{ rad/s})^2]$$

$$a_{\text{collar/rod}} = 38400 \text{ mm/s}^2$$

or $\qquad (a_{\text{collar/rod}})_A = 38.4 \text{ m/s}^2$ ◀

(c) $\quad$ After the cord is cut, the only horizontal force acting on the collar is due to the spring. Thus, angular momentum about the shaft is conserved.

$$r_A\, m(v_A)_\theta = r_B\, m(v_B)_\theta \quad \text{where} \quad (v_A)_\theta = r_A\, \dot{\theta}_0$$

Then $\qquad (v_B)_\theta = \dfrac{150 \text{ mm}}{450 \text{ mm}}[(150 \text{ mm})(16 \text{ rad/s})] = 800 \text{ mm/s}$

or $\qquad (v_B)_\theta = 0.800 \text{ m/s}$ ◀

PROBLEM 12.91

A 1-lb ball A and a 2-lb ball B are mounted on a horizontal rod which rotates freely about a vertical shaft. The balls are held in the positions shown by pins. The pin holding B is suddenly removed and the ball moves to position C as the rod rotates. Neglecting friction and the mass of the rod and knowing that the initial speed of A is $v_A = 8$ ft/s, determine (a) the radial and transverse components of the acceleration of ball B immediately after the pin is removed, (b) the acceleration of ball B relative to the rod at that instant, (c) the speed of ball A after ball B has reached the stop at C.

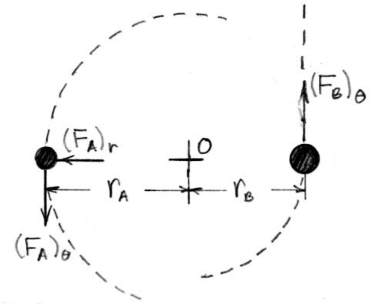
SOLUTION

Let r and θ be polar coordinates with the origin lying at the shaft.

Constraint of rod: $\theta_B = \theta_A + \pi$ radians; $\dot{\theta}_B = \dot{\theta}_A = \dot{\theta}$; $\ddot{\theta}_B = \ddot{\theta}_A = \ddot{\theta}$.

(a) Components of acceleration

Sketch the free body diagrams of the balls showing the radial and transverse components of the forces acting on them. Owing to frictionless sliding of B along the rod, $(F_B)_r = 0$.



Radial component of acceleration of B.

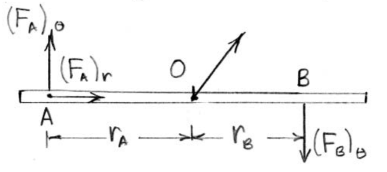
$$F_r = m_B(a_B)_r: \qquad (a_B)_r = 0 \blacktriangleleft$$

Transverse components of acceleration.

$$(a_A)_\theta = r_A\ddot{\theta} + 2\dot{r}_A\dot{\theta} = ra\ddot{\theta}$$

$$(a_B)_\theta = r_B\ddot{\theta} + 2\dot{r}_B\dot{\theta} \qquad (1)$$

Since the rod is massless, it must be in equilibrium. Draw its free body diagram, applying Newton's 3rd Law.



$$+\circlearrowleft \Sigma M_0 = 0: \quad r_A(F_A)_\theta + r_B(F_B)_\theta = r_A m_A (a_A)_\theta + r_B m_B (a_B)_\theta = 0$$

$$r_A m_A r_A \ddot{\theta} + r_B m_B (r_B\ddot{\theta} + 2\dot{r}_B\dot{\theta}) = 0$$

$$\ddot{\theta} = \frac{-2m_B\dot{r}_B\dot{\theta}}{m_A r_A^2 + m_B r_B^2}$$

At $t = 0$, $\dot{r}_B = 0$ so that $\ddot{\theta} = 0$.

From Eq. (1), $(a_B)_\theta = 0 \blacktriangleleft$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.91 (Continued)

(*b*) Acceleration of *B* relative to the rod.

At $t = 0$, $(v_A)_\theta = 8$ ft/s $= 96$ in./s, $\dot{\theta} = \dfrac{(v_A)_\theta}{r_A} = \dfrac{96}{10} = 9.6$ rad/s

$$\ddot{r}_B - r_B\dot{\theta}^2 = (a_B)_r = 0$$

$$\ddot{r}_B = r_B\dot{\theta}^2 = (8)(9.6)^2 = 737.28 \text{ in./s}^2$$

$$\ddot{r}_B = 61.4 \text{ ft/s}^2 \blacktriangleleft$$

(*c*) Speed of *A*.

Substituting $\dfrac{d}{dt}(mr^2\dot{\theta})$ for rF_θ in each term of the moment equation gives

$$\frac{d}{dt}\left(m_A r_A{}^2\dot{\theta}\right) + \frac{d}{dt}\left(m_B r_B{}^2\dot{\theta}\right) = 0$$

Integrating with respect to time,

$$m_A r_A{}^2\dot{\theta} + m_B r_B{}^2\dot{\theta} = \left(m_A r_A{}^2\dot{\theta}\right)_0 + \left(m_B r_B{}^2\dot{\theta}\right)_0$$

Applying to the final state with ball *B* moved to the stop at *C*,

$$\left(\frac{W_A}{g}r_A^2 + \frac{W_B}{g}r_C^2\right)\dot{\theta}_f = \left[\frac{W_A}{g}r_A^2 + \frac{W_B}{g}(r_B)_0^2\right]\dot{\theta}_0$$

$$\dot{\theta}_f = \frac{W_A r_A{}^2 + W_B (r_B)_0^2}{W_A r_A{}^2 + W_B r_C{}^2}\dot{\theta}_0 = \frac{(1)(10)^2 + (2)(8)^2}{(1)(10)^2 + (2)(16)^2}(9.6) = 3.5765 \text{ rad/s}$$

$(v_A)_f = r_A\dot{\theta}_f = (10)(3.5765) = 35.765$ in./s $\qquad (v_A)_f = 2.98$ ft/s $\blacktriangleleft$

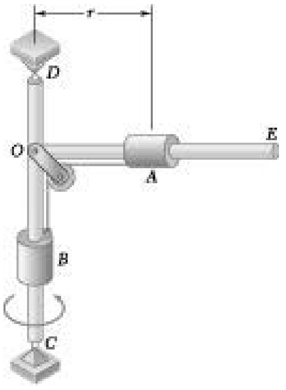
PROBLEM 12.92



Two 2.6-lb collars A and B can slide without friction on a frame, consisting of the horizontal rod OE and the vertical rod CD, which is free to rotate about CD. The two collars are connected by a cord running over a pulley that is attached to the frame at O and a stop prevents collar B from moving. The frame is rotating at the rate $\dot{\theta} = 12$ rad/s and $r = 0.6$ ft when the stop is removed allowing collar A to move out along rod OE. Neglecting friction and the mass of the frame, determine, for the position $r = 1.2$ ft, (a) the transverse component of the velocity of collar A, (b) the tension in the cord and the acceleration of collar A relative to the rod OE.

SOLUTION

Masses: $m_A = m_B = \dfrac{2.6}{32.2} = 0.08075\ \text{lb}\cdot\text{s}^2/\text{ft}$

(a) Conservation of angular momentum of collar A: $(H_0)_2 = (H_0)_1$

$$m_A r_1 (v_\theta)_1 = m_A r_2 (v_\theta)_2$$

$$(v_\theta)_2 = \frac{r_1(v_\theta)_1}{r_2} = \frac{r_1^2\dot{\theta}_1}{r_2} = \frac{(0.6)^2(12)}{1.2} = 3.6$$

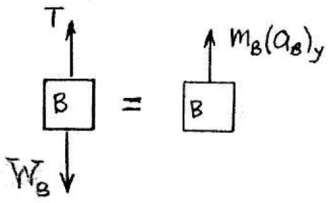
$(v_\theta)_2 = 3.60$ ft/s ◀

$$\dot{\theta}_2 = \frac{(v_\theta)_2}{r_A} = \frac{3.6}{1.2} = 3.00\ \text{rad/s}$$

(b) Let y be the position coordinate of B, positive upward with origin at O.

Constraint of the cord: $r - y = \text{constant}$ or $\ddot{y} = \ddot{r}$

Kinematics:



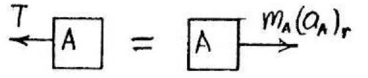
$$(a_B)_y = \ddot{y} = \ddot{r} \qquad \text{and} \qquad (a_A)_r = \ddot{r} - r\dot{\theta}^2$$

Collar B: $\Sigma F_y = m_B a_B$: $T - W_B = m_B\ddot{y} = m_B\ddot{r}$ (1)

Collar A: $\xrightarrow{+} \Sigma F_r = m_A(a_A)_r$: $-T = m_A(\ddot{r} - r\dot{\theta}^2)$ (2)

Adding (1) and (2) to eliminate T,

$$-W_B = (m_A + m_B)\ddot{r} + m_A r\dot{\theta}^2$$

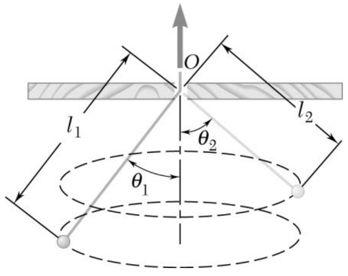


$$a_{A/\text{rod}} = \ddot{r} = \frac{m_A r\dot{\theta}^2 - W_B}{m_A + m_B} = \frac{(0.08075)(1.2)(3.00)^2 - (2.6)}{0.08075 + 0.08075} = -10.70\ \text{ft/s}^2$$

$T = m_B(\ddot{r} + g) = (0.08075)(-10.70 + 32.2)$ $T = 1.736$ lb ◀

$a_{A/\text{rod}} = 10.70\ \text{ft/s}^2$ radially inward. ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.93

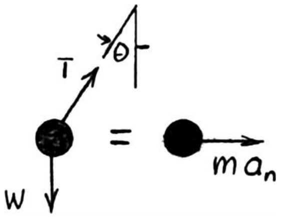
A small ball swings in a horizontal circle at the end of a cord of length l_1, which forms an angle θ_1 with the vertical. The cord is then slowly drawn through the support at O until the length of the free end is l_2. (*a*) Derive a relation among l_1, l_2, θ_1, and θ_2. (*b*) If the ball is set in motion so that initially $l_1 = 0.8$ m and $\theta_1 = 35°$, determine the angle θ_2 when $l_2 = 0.6$ m.

SOLUTION

(*a*) For state 1 or 2, neglecting the vertical component of acceleration,

$$+\uparrow \Sigma F_y = 0: \quad T\cos\theta - W = 0$$

$$T = W\cos\theta$$



$$\xrightarrow{+} \Sigma F_x = ma_n: \quad T\sin\theta = W\sin\theta\cos\theta = \frac{mv^2}{\rho}$$

But $\rho = \ell\sin\theta$ so that

$$v^2 = \frac{\rho W}{m}\sin^2\theta\cos\theta = \ell\, g\,\sin\theta\tan\theta$$

$$v_1 = \sqrt{\ell_1 g\,\sin\theta_1\tan\theta_1}$$

and

$$v_2 = \sqrt{\ell_2\, g\,\sin\theta_2\tan\theta_2}$$

$$\Sigma M_y = 0: \quad H_y = \text{constant}$$

$$r_1 m v_1 = r_2 m v_2 \qquad \text{or} \qquad v_1\ell_1\sin\theta_1 = v_2\ell_2\sin\theta_2$$

$$\ell_1^{3/2} g\,\sin\theta_1\sqrt{\sin\theta_1\tan\theta_1} = \ell_2^{3/2}\,\sin\theta_2\sqrt{\sin\theta_2\tan\theta_2}$$

$$\ell_1^3\sin^3\theta_1\tan\theta_1 = \ell_2^3\sin^3\theta_2\tan\theta_2 \blacktriangleleft$$

(*b*) With $\theta_1 = 35°$, $\ell_1 = 0.8$ m, and $\ell_2 = 0.6$ m

$$(0.8)^3\sin^3 35°\tan 35° = (0.6)^3\sin^3\theta_2\tan\theta_2$$

$$\sin^3\theta_2\tan\theta_2 - 0.31320 = 0 \qquad \theta_2 = 43.6° \blacktriangleleft$$

PROBLEM 12.94

A particle of mass m is projected from Point A with an initial velocity $\mathbf{v}_0$ perpendicular to OA and moves under a central force $\mathbf{F}$ along an elliptic path defined by the equation $r = r_0/(2-\cos\theta)$. Using Eq. (12.37), show that $\mathbf{F}$ is inversely proportional to the square of the distance r from the particle to the center of force O.

SOLUTION

$$u = \frac{1}{r} = \frac{2-\cos\theta}{r_0}, \quad \frac{du}{d\theta} = \frac{\sin\theta}{r_0}, \quad \frac{d^2u}{d\theta^2} = \frac{\cos\theta}{r_0}$$

$$\frac{d^2u}{d\theta^2} + u = \frac{2}{r_0} = \frac{F}{mh^2u^2} \quad \text{by Eq. (12.37).}$$

Solving for F,

$$F = \frac{2mh^2u^2}{r_0} = \frac{2mh^2}{r_0 r^2}$$

Since m, h, and r_0 are constants, F is proportional to $\frac{1}{r^2}$, or inversely proportional to r^2.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.95

A particle of mass m describes the logarithmic spiral $r = r_0 e^{b\theta}$ under a central force **F** directed toward the center of force O. Using Eq. (12.37) show that **F** is inversely proportional to the cube of the distance r from the particle to O.

SOLUTION

$$u = \frac{1}{r} = \frac{1}{r_0} e^{-b\theta}$$

$$\frac{du}{d\theta} = -\frac{b}{r_0} e^{-b\theta}$$

$$\frac{d^2u}{d\theta^2} = \frac{b^2}{r_0} e^{-b\theta}$$

$$\frac{d^2u}{d\theta^2} + u = \frac{b^2 + 1}{r_0} e^{-b\theta} = \frac{F}{mh^2u^2}$$

$$F = \frac{(b^2 + 1)mh^2u^2}{r_0} e^{-b\theta}$$

$$= \frac{(b^2 + 1)mh^2u^2}{r} = \frac{(b^2 + 1)mh^2}{r^3}$$

Since b, m, and h are constants, **F** is proportional to $\frac{1}{r^3}$, or inversely proportional to r^3.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 12.96

For the particle of Problem 12.74, and using Eq. (12.37), show that the central force **F** is proportional to the distance r from the particle to the center of force O.

PROBLEM 12.74 A particle of mass m is projected from Point A with an initial velocity $\mathbf{v}_0$ perpendicular to line OA and moves under a central force **F** directed away from the center of force O. Knowing that the particle follows a path defined by the equation $r = r_0/\sqrt{\cos 2\theta}$ and using Eq. (12.27), express the radial and transverse components of the velocity **v** of the particle as functions of θ.

SOLUTION

$$u = \frac{1}{r} = \frac{\sqrt{\cos 2\theta}}{r_0}, \quad \frac{du}{d\theta} = -\frac{\sin 2\theta}{r_0\sqrt{\cos 2\theta}}$$

$$\frac{d^2u}{d\theta} = -\frac{\sqrt{\cos 2\theta}(2\cos 2\theta) - \sin 2\theta(-\sin 2\theta/\sqrt{\cos 2\theta})}{r_0 \cos 2\theta}$$

$$= -\frac{2\cos^2 2\theta + \sin^2 2\theta}{r_0(\cos 2\theta)^{3/2}} = -\frac{(1+\cos^2 2\theta)}{r_0(\cos 2\theta)^{3/2}}$$

Eq. (12.37): $\dfrac{d^2u}{d\theta^2} + u = \dfrac{F}{mh^2u^2}$

Solving for F,

$$F = mh^2u^2\left(\frac{d^2u}{d\theta} + u\right)$$

$$= mh^2\frac{\cos 2\theta}{r_0^2}\left[-\frac{1+\cos^2 2\theta}{r_0(\cos 2\theta)^{3/2}} + \frac{\sqrt{\cos 2\theta}}{r_0}\right]$$

$$= mh^2\frac{\cos 2\theta}{r_0^2}\left[-\frac{1}{r_0(\cos 2\theta)^{3/2}} - \frac{\sqrt{\cos 2\theta}}{r_0} + \frac{\sqrt{\cos 2\theta}}{r_0}\right]$$

$$= -\frac{mh^2}{r_0^3\sqrt{\cos 2\theta}} = -\frac{mh^2}{r_0^4}\frac{r_0}{\sqrt{\cos 2\theta}} \qquad F = -\frac{mh^2 r}{r_0^4} \blacktriangleleft$$

The force F is proportional to r. The minus sign indicates that it is repulsive.

PROBLEM 12.97

A particle of mass m describes the path defined by the equation $r = r_0 \sin\theta$ under a central force **F** directed toward the center of force O. Using Eq. (12.37), show that **F** is inversely proportional to the fifth power of the distance r from the particle to O.

SOLUTION

We have
$$\frac{d^2u}{d\theta^2} + u = \frac{F}{mh^2u^2} \qquad \text{Eq. (12.37)}$$

where
$$u = \frac{1}{r} \quad \text{and} \quad mh^2 = \text{constant}$$

$$F \times u^2\left(\frac{d^2u}{d\theta^2} + u\right)$$

Now
$$u = \frac{1}{r} = \frac{1}{r_0 \sin\theta}$$

Then
$$\frac{du}{d\theta} = \frac{1}{d\theta}\left(\frac{1}{r_0 \sin\theta}\right) = -\frac{1}{r_0}\frac{\cos\theta}{\sin^2\theta}$$

and
$$\frac{d^2u}{d\theta^2} = -\frac{1}{r_0}\left[\frac{-\sin\theta(\sin^2\theta) - \cos\theta(2\sin\theta\cos\theta)}{\sin^4\theta}\right]$$
$$= \frac{1}{r_0}\frac{1+\cos^2\theta}{\sin^3\theta}$$

Then
$$F \times \left(\frac{1}{r^2}\right)\left(\frac{1}{r_0}\frac{1+\cos^2\theta}{\sin^3\theta} + \frac{1}{r_0\sin\theta}\right)$$
$$= mh^2\frac{1}{r_0}\frac{1}{r^2}\left(\frac{1+\cos^2\theta}{\sin^3\theta} + \frac{\sin^2\theta}{\sin^3\theta}\right)$$
$$= mh^2\frac{2}{r_0}\frac{1}{r^2}\frac{1}{\sin^3\theta} \qquad \sin^3\theta = \left(\frac{r}{r_0}\right)^3$$
$$= mh^2\frac{2r_0^2}{r^5}$$

F is proportional to $\frac{1}{r^5}$ $\quad F \times \frac{1}{r^5}$ Q.E.D. ◀

Note: $F > 0$ implies that **F** is attractive.

PROBLEM 12.98

It was observed that during its second flyby of the earth, the Galileo spacecraft had a velocity of 14.1 km/s as it reached its minimum altitude of 303 km above the surface of the earth. Determine the eccentricity of the trajectory of the spacecraft during this portion of its flight.

SOLUTION

For earth, $R = 6.37 \times 10^6$ m

$$r_0 = 6.37 \times 10^6 + 303. \times 10^3 = 6.673 \times 10^6 \text{ m}$$

$$h = r_0 v_0 = (6.673 \times 10^6)(14.1 \times 10^3) = 94.09 \times 10^9 \text{ m}^2/\text{s}$$

$$GM = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

$$\frac{1}{r_0} = \frac{GM}{h^2}(1 + \varepsilon)$$

$$1 + \varepsilon = \frac{h^2}{r_0 GM} = \frac{(94.09 \times 10^9)^2}{(6.673 \times 10^6)(398.06 \times 10^{12})} = 3.33$$

$$\varepsilon = 3.33 - 1$$

$\varepsilon = 2.33$ ◀

PROBLEM 12.99

It was observed that during the Galileo spacecraft's first flyby of the earth, its maximum altitude was 600 mi above the surface of the earth. Assuming that the trajectory of the spacecraft was parabolic, determine the maximum velocity of Galileo during its first flyby of the earth.

SOLUTION

For the earth: $R = 3960 \text{ mi} = 20.909 \times 10^6 \text{ ft}$

$$GM = gR^2 = (32.2)(20.909 \times 10^6)^2 = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

For a parabolic trajectory, $\varepsilon = 1.$

Eq. (12.39′): $\dfrac{1}{r} = \dfrac{GM}{h^2}(1 + \cos\theta)$

At $\theta = 0$, $\dfrac{1}{r_0} = \dfrac{2GM}{h^2} = \dfrac{2GM}{r_0^2 v_0^2}$ or $v_0 = \sqrt{\dfrac{2GM}{r_0}}$

At $r_0 = 3960 + 600 = 4560 \text{ mi} = 24.077 \times 10^6 \text{ ft},$

$$v_0 = \sqrt{\frac{(2)(14.077 \times 10^{15})}{24.077 \times 10^6}} = 34.196 \times 10^3 \text{ ft/s}$$

$v_0 = 6.48 \text{ mi/s}$ ◀

PROBLEM 12.100

As a space probe approaching the planet Venus on a parabolic trajectory reaches Point A closest to the planet, its velocity is decreased to insert it into a circular orbit. Knowing that the mass and the radius of Venus are 4.87×10^{24} kg and 6052 km, respectively, determine (*a*) the velocity of the probe as it approaches A, (*b*) the decrease in velocity required to insert it into the circular orbit.

SOLUTION

First note $$r_A = (6052 + 280)\text{ km} = 6332\text{ km}$$

(*a*) From the textbook, the velocity at the point of closest approach on a parabolic trajectory is given by

$$v_0 = \sqrt{\frac{2GM}{r_0}}$$

Thus, $$(v_A)_{\text{par}} = \left[\frac{2\times66.73\times10^{-12}\text{ m}^3/\text{kg}\cdot\text{s}^2\times4.87\times10^{24}\text{kg}}{6332\times10^3\text{ m}}\right]^{1/2}$$

$$= 10{,}131.4\text{ m/s}$$

or $$(v_A)_{\text{par}} = 10.13\text{ km/s} \blacktriangleleft$$

(*b*) We have $$(v_A)_{\text{circ}} = (v_A)_{\text{par}} + \Delta v_A$$

Now $$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_0}} \qquad \text{Eq. (12.44)}$$

$$= \frac{1}{\sqrt{2}}(v_A)_{\text{par}}$$

Then $$\Delta v_A = \frac{1}{\sqrt{2}}(v_A)_{\text{par}} - (v_A)_{\text{par}}$$

$$= \left(\frac{1}{\sqrt{2}} - 1\right)(10.1314\text{ km/s})$$

$$= -2.97\text{ km/s}$$

$$|\Delta v_A| = 2.97\text{ km/s} \blacktriangleleft$$

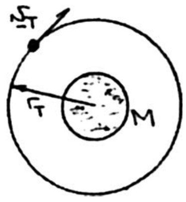
PROBLEM 12.101

It was observed that as the Voyager I spacecraft reached the point of its trajectory closest to the planet Saturn, it was at a distance of 185×10^3 km from the center of the planet and had a velocity of 21.0 km/s. Knowing that Tethys, one of Saturn's moons, describes a circular orbit of radius 295×10^3 km at a speed of 11.35 km/s, determine the eccentricity of the trajectory of Voyager I on its approach to Saturn.

SOLUTION

For a circular orbit,



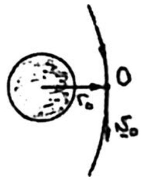
Eq. (12.44)
$$v = \sqrt{\frac{GM}{r}}$$

For the orbit of Tethys,
$$GM = r_T v_T^2$$

For Voyager's trajectory, we have
$$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta)$$

where $h = r_0 v_0$

At O,
$$r = r_0,\ \theta = 0$$



Then
$$\frac{1}{r_0} = \frac{GM}{(r_0 v_0)^2}(1+\varepsilon)$$

or
$$\varepsilon = \frac{r_0 v_0^2}{GM} - 1 = \frac{r_0 v_0^2}{r_T v_T^2} - 1$$
$$= \frac{185\times10^3\ \text{km}}{295\times10^3\ \text{km}}\times\left(\frac{21.0\ \text{km/s}}{11.35\ \text{km/s}}\right)^2 - 1$$

or
$$\varepsilon = 1.147 \blacktriangleleft$$

PROBLEM 12.102

A satellite describes an elliptic orbit about a planet of mass M. Denoting by r_0 and r_1, respectively, the minimum and maximum values of the distance r from the satellite to the center of the planet, derive the relation

$$\frac{1}{r_0} + \frac{1}{r_1} = \frac{2GM}{h^2}$$

where h is the angular momentum per unit mass of the satellite.

SOLUTION

Using Eq. (12.39), $$\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$$

and $$\frac{1}{r_B} = \frac{GM}{h^2} + C\cos\theta_B.$$

But $$\theta_B = \theta_A + 180°,$$

so that $$\cos\theta_A = -\cos\theta_B.$$

Adding, $$\frac{1}{r_A} + \frac{1}{r_B} = \frac{1}{r_0} + \frac{1}{r_1} = \frac{2GM}{h^2}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.103

A space probe is describing a circular orbit about a planet of radius R. The altitude of the probe above the surface of the planet is αR and its speed is v_0. To place the probe in an elliptic orbit which will bring it closer to the planet, its speed is reduced from v_0 to βv_0, where $\beta < 1$, by firing its engine for a short interval of time. Determine the smallest permissible value of β if the probe is not to crash on the surface of the planet.

SOLUTION

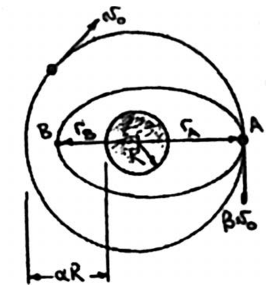
For the circular orbit, $$v_0 = \sqrt{\frac{GM}{r_A}} \quad \text{Eq. (12.44)},$$

where $$r_A = R + \alpha R = R(1+\alpha)$$

Then $$GM = v_0^2 R(1+\alpha)$$

From the solution to Problem 12.102, we have for the elliptic orbit,

$$\frac{1}{r_A} + \frac{1}{r_B} = \frac{2GM}{h^2}$$



Now $$h = h_A = r_A (v_A)_{AB} = [R(1+\alpha)](\beta v_0)$$

Then $$\frac{1}{R(1+\alpha)} + \frac{1}{r_B} = \frac{2v_0^2 R(1+\alpha)}{[R(1+\alpha)\beta v_0]^2} = \frac{2}{\beta^2 R(1+\alpha)}$$

Now $\beta_{\min}$ corresponds to $r_B \to R$.

Then $$\frac{1}{R(1+\alpha)} + \frac{1}{R} = \frac{2}{\beta_{\min}^2 R(1+\alpha)}$$

or $$\beta_{\min} = \sqrt{\frac{2}{2+\alpha}} \blacktriangleleft$$

PROBLEM 12.104

At main engine cutoff of its thirteenth flight, the space shuttle Discovery was in an elliptic orbit of minimum altitude 60 km and maximum altitude 500 km above the surface of the earth. Knowing that at Point A the shuttle had a velocity $\mathbf{v}_0$ parallel to the surface of the earth and that the shuttle was transferred to a circular orbit as it passed through Point B, determine (a) the speed v_0 of the shuttle at A, (b) the increase in speed required at B to insert the shuttle into the circular orbit.

SOLUTION

For earth, $R = 6370 \text{ km} = 6370\times10^3 \text{ m}$

$$GM = gR^2 = (9.81)(6370\times10^3)^2 = 3.9806\times10^{14} \text{ m}^3/\text{s}^2$$

$$r_A = 6370 + 60 = 6430 \text{ km} = 6430\times10^3 \text{ m}$$

$$r_B = 6370 + 500 = 6870 \text{ km} = 6870\times10^3 \text{ m}$$

Elliptic trajectory.

Using Eq. (12.39), $\quad \dfrac{1}{r_A} = \dfrac{GM}{h^2} + C\cos\theta_A \quad$ and $\quad \dfrac{1}{r_B} = \dfrac{GM}{h^2} + C\cos\theta_B.$

But $\quad \theta_B = \theta_A + 180°, \quad$ so that $\quad \cos\theta_A = -\cos\theta_B$

Adding, $\quad \dfrac{1}{r_A} + \dfrac{1}{r_B} = \dfrac{r_A + r_B}{r_A r_B} = \dfrac{2GM}{h^2}$

$$h = \sqrt{\frac{2GMr_Ar_B}{r_A + r_B}} = \sqrt{\frac{(2)(3.9806\times10^{14})(6430\times10^3)(6870\times10^3)}{6430\times10^3 + 6870\times10^3}} = 51.422\times10^9 \text{ m}^2/\text{s}$$

(a) Speed v_0 at A.

$$v_0 = v_A = \frac{h}{r_A} = \frac{51.422\times10^9}{6430\times10^3} \qquad v_0 = 8.00\times10^3 \text{ m/s} \blacktriangleleft$$

$$(v_B)_1 = \frac{h}{r_A} = \frac{51.422\times10^9}{6870\times10^3} = 7.48497\times10^3 \text{ m/s}$$

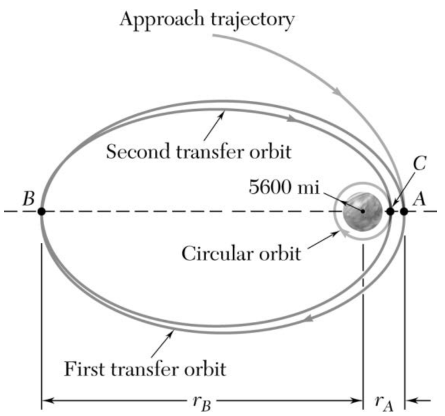
For a circular orbit through Point B,

$$(v_B)_{\text{circ}} = \sqrt{\frac{GM}{r_B}} = \sqrt{\frac{3.9806\times10^{14}}{6870\times10^3}} = 7.6119\times10^3 \text{ m/s}$$

(b) Increase in speed at Point B.

$$\Delta v_B = (v_B)_{\text{circ}} - (v_B)_1 = 126.97 \text{ m/s} \qquad \Delta v_B = 127 \text{ m/s} \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.105

A space probe is to be placed in a circular orbit of 5600 mi radius about the planet Venus in a specified plane. As the probe reaches A, the point of its original trajectory closest to Venus, it is inserted in a first elliptic transfer orbit by reducing its speed by Δv_A. This orbit brings it to Point B with a much reduced velocity. There the probe is inserted in a second transfer orbit located in the specified plane by changing the direction of its velocity and further reducing its speed by Δv_B. Finally, as the probe reaches Point C, it is inserted in the desired circular orbit by reducing its speed by Δv_C. Knowing that the mass of Venus is 0.82 times the mass of the earth, that $r_A = 9.3 \times 10^3$ mi and $r_B = 190 \times 10^3$ mi, and that the probe approaches A on a parabolic trajectory, determine by how much the velocity of the probe should be reduced (*a*) at A, (*b*) at B, (*c*) at C.

SOLUTION

For Earth, $R = 3690 \text{ mi} = 20.9088 \times 10^6 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$

$$GM_{\text{earth}} = gR^2 = (32.2)(20.9088 \times 10^6)^2 = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

For Venus, $GM = 0.82GM_{\text{earth}} = 11.543 \times 10^{15} \text{ ft}^3/\text{s}^2$

For a parabolic trajectory with $r_A = 9.3 \times 10^3 \text{ mi} = 49.104 \times 10^6 \text{ ft}$

$$(v_A)_1 = v_{\text{esc}} = \sqrt{\frac{2GM}{r_A}} = \sqrt{\frac{(2)(11.543 \times 10^{15})}{49.104 \times 10^6}} = 21.683 \times 10^3 \text{ ft/s}$$

<u>First transfer orbit *AB*.</u> $r_B = 190 \times 10^3 \text{ mi} = 1003.2 \times 10^6 \text{ ft}$

At Point A, where $\theta = 180°$

$$\frac{1}{r_A} = \frac{GM}{h_{AB}^2} + C \cos 180° = \frac{GM}{h_{AB}^2} - C \qquad (1)$$

At Point B, where $\theta = 0°$

$$\frac{1}{r_B} = \frac{GM}{h_{AB}^2} + C \cos 0 = \frac{GM}{h_{AB}^2} + C \qquad (2)$$

Adding, $\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_B + r_A}{r_A r_B} = \frac{2GM}{h_{AB}^2}$

PROBLEM 12.106

For the space probe of Problem 12.105, it is known that $r_A = 9.3\times10^3$ mi and that the velocity of the probe is reduced to 20,000 ft/s as it passes through *A*. Determine (*a*) the distance from the center of Venus to Point *B*, (*b*) the amounts by which the velocity of the probe should be reduced at *B* and *C*, respectively.

SOLUTION

Data from Problem 12.105: $r_C = 29.568\times10^6$ ft, $M = 0.82\, M_{\text{earth}}$

For Earth, $R = 3960 \text{ mi} = 20.9088\times10^6 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$

$$GM_{\text{earth}} = gR^2 = (32.2)(20.9088\times10^6)^2 = 14.077\times10^{15} \text{ m}^3/\text{s}^2$$

For Venus, $GM = 0.82 GM_{\text{earth}} = 11.543\times10^{15} \text{ ft}^3/\text{s}^2$

Transfer orbit *AB*: $v_A = 20{,}000 \text{ ft/s}, \quad r_A = 9.3\times10^3 \text{ mi} = 49.104\times10^6 \text{ ft}$

$$h_{AB} = r_A v_A = (49.104\times10^6)(20{,}000) = 982.08\times10^9 \text{ ft}^2/\text{s}$$

At Point *A*, where $\theta = 180°$

$$\frac{1}{r_A} = \frac{GM}{h_{AB}^2} + C\cos 180° = \frac{GM}{h_{AB}^2} - C$$

At Point *B*, where $\theta = 0°$

$$\frac{1}{r_B} = \frac{GM}{h_{AB}^2} + C\cos 0 = \frac{GM}{h_{AB}^2} + C$$

Adding, $\dfrac{1}{r_A} + \dfrac{1}{r_B} = \dfrac{2GM}{h_{AB}^2}$

$$\frac{1}{r_B} = \frac{2GM}{h_{AB}^2} - \frac{1}{r_A}$$
$$= \frac{(2)(11.543\times10^{15})}{(982.08\times10^9)^2} - \frac{1}{49.104\times10^6}$$
$$= 3.57125\times10^{-9} \text{ ft}^{-1}$$

(*a*) Radial coordinate r_B. $r_B = 280.01\times10^6$ ft $\qquad r_B = 53.0\times10^3$ mi ◀

$$(v_B)_1 = \frac{h_{AB}}{r_B} = \frac{982.08\times10^9}{280.01\times10^6} = 3.5073\times10^3 \text{ ft/s}$$

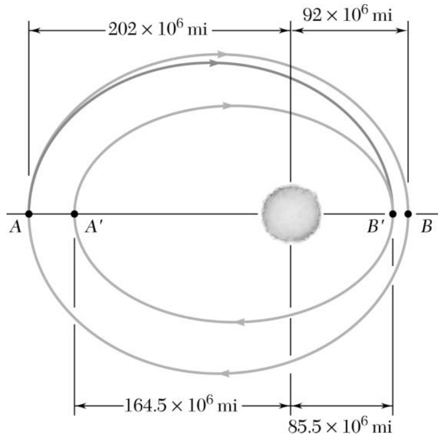
PROBLEM 12.107



As it describes an elliptic orbit about the sun, a spacecraft reaches a maximum distance of 202×10^6 mi from the center of the sun at Point *A* (called the aphelion) and a minimum distance of 92×10^6 mi at Point *B* (called the perihelion). To place the spacecraft in a smaller elliptic orbit with aphelion at A' and perihelion at B', where A' and B' are located 164.5×10^6 mi and 85.5×10^6 mi, respectively, from the center of the sun, the speed of the spacecraft is first reduced as it passes through *A* and then is further reduced as it passes through B'. Knowing that the mass of the sun is 332.8×10^3 times the mass of the earth, determine (*a*) the speed of the spacecraft at *A*, (*b*) the amounts by which the speed of the spacecraft should be reduced at *A* and B' to insert it into the desired elliptic orbit.

SOLUTION

First note
$$R_{\text{earth}} = 3960 \text{ mi} = 20.9088\times10^6 \text{ ft}$$
$$r_A = 202\times10^6 \text{ mi} = 1066.56\times10^9 \text{ ft}$$
$$r_B = 92\times10^6 \text{ mi} = 485.76\times10^9 \text{ ft}$$

From the solution to Problem 12.102, we have for any elliptic orbit about the sun

$$\frac{1}{r_1}+\frac{1}{r_2}=\frac{2GM_{\text{sun}}}{h^2}$$

(*a*) For the elliptic orbit *AB*, we have

$$r_1 = r_A,\quad r_2 = r_B,\quad h = h_A = r_A v_A$$

Also,
$$GM_{\text{sun}} = G[(332.8\times10^3)M_{\text{earth}}]$$
$$= gR_{\text{earth}}^2(332.8\times10^3) \qquad \text{using Eq. (12.30).}$$

Then
$$\frac{1}{r_A}+\frac{1}{r_B}=\frac{2gR_{\text{earth}}^2(332.8\times10^3)}{(r_A v_A)^2}$$

or
$$v_A = \frac{R_{\text{earth}}}{r_A}\left(\frac{665.6g\times10^3}{\frac{1}{r_A}+\frac{1}{r_B}}\right)^{1/2}$$
$$= \frac{3960 \text{ mi}}{202\times10^6 \text{ mi}}\left(\frac{665.6\times10^3\times32.2 \text{ ft/s}^2}{\frac{1}{1066.56\times10^9 \text{ ft}}+\frac{1}{485.76\times10^9 \text{ ft}}}\right)^{1/2}$$
$$= 52{,}431 \text{ ft/s}$$

or
$$v_A = 52.4\times10^3 \text{ ft/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) From Part (*a*), we have

$$2GM_{\text{sun}} = (r_A v_A)^2 \left(\frac{1}{r_A} + \frac{1}{r_B} \right)$$

Then, for any other elliptic orbit about the sun, we have

$$\frac{1}{r_1} + \frac{1}{r_2} = \frac{(r_A v_A)^2 \left(\frac{1}{r_A} + \frac{1}{r_B} \right)}{h^2}$$

For the elliptic transfer orbit AB', we have

$$r_1 = r_A, \quad r_2 = r_{B'}, \quad h = h_{\text{tr}} = r_A (v_A)_{\text{tr}}$$

Then
$$\frac{1}{r_A} + \frac{1}{r_{B'}} = \frac{(r_A v_A)^2 \left(\frac{1}{r_A} + \frac{1}{r_B} \right)}{[r_A (v_A)_{\text{tr}}]^2}$$

or
$$(v_A)_{\text{tr}} = v_A \left(\frac{\frac{1}{r_A} + \frac{1}{r_B}}{\frac{1}{r_A} + \frac{1}{r_{B'}}} \right)^{1/2} = v_A \left(\frac{1 + \frac{r_A}{r_B}}{1 + \frac{r_A}{r_{B'}}} \right)^{1/2}$$

$$= (52{,}431 \text{ ft/s}) \left(\frac{1 + \frac{202}{92}}{1 + \frac{202}{85.5}} \right)^{1/2}$$

$$= 51{,}113 \text{ ft/s}$$

Now
$$h_{\text{tr}} = (h_A)_{\text{tr}} = (h_{B'})_{\text{tr}}: \quad r_A (v_A)_{\text{tr}} = r_{B'} (v_{B'})_{\text{tr}}$$

Then
$$(v_{B'})_{\text{tr}} = \frac{202 \times 10^6 \text{ mi}}{85.5 \times 10^6 \text{ mi}} \times 51{,}113 \text{ ft/s} = 120{,}758 \text{ ft/s}$$

For the elliptic orbit $A'B'$, we have

$$r_1 = r_{A'}, \quad r_2 = r_{B'}, \quad h = r_{B'} v_{B'}$$

Then
$$\frac{1}{r_{A'}} + \frac{1}{r_{B'}} = \frac{(r_A v_A)^2 \left(\frac{1}{r_A} + \frac{1}{r_B} \right)}{(r_{B'} v_{B'})^2}$$

or
$$v_{B'} = v_A \frac{r_A}{r_{B'}} \left(\frac{\frac{1}{r_A} + \frac{1}{r_B}}{\frac{1}{r_{A'}} + \frac{1}{r_{B'}}} \right)^{1/2}$$

$$= (52{,}431 \text{ ft/s}) \frac{202 \times 10^6 \text{ mi}}{85.5 \times 10^6 \text{ mi}} \left(\frac{\frac{1}{202 \times 10^6} + \frac{1}{92 \times 10^6}}{\frac{1}{164.5 \times 10^6} + \frac{1}{85.5 \times 10^6}} \right)^{1/2}$$

$$= 116{,}862 \text{ ft/s}$$

PROBLEM 12.108

Halley's comet travels in an elongated elliptic orbit for which the minimum distance from the sun is approximately $\frac{1}{2}r_E$, where $r_E = 150\times10^6$ km is the mean distance from the sun to the earth. Knowing that the periodic time of Halley's comet is about 76 years, determine the maximum distance from the sun reached by the comet.

SOLUTION

We apply Kepler's Third Law to the orbits and periodic times of earth and Halley's comet:

$$\left(\frac{\tau_H}{\tau_E}\right)^2 = \left(\frac{a_H}{a_E}\right)^3$$

Thus

$$a_H = a_E\left(\frac{\tau_H}{\tau_E}\right)^{2/3}$$

$$= r_E\left(\frac{76 \text{ years}}{1 \text{ year}}\right)^{2/3}$$

$$= 17.94 r_E$$

But

$$a_H = \frac{1}{2}(r_{\text{min}} + r_{\text{max}})$$

$$17.94 r_E = \frac{1}{2}\left(\frac{1}{2}r_E + r_{\text{max}}\right)$$

$$r_{\text{max}} = 2(17.94 r_E) - \frac{1}{2}r_E$$

$$= (35.88 - 0.5)r_E$$

$$= 35.38\, r_E$$

$$r_{\text{max}} = (35.38)(150\times10^6 \text{ km})$$

$r_{\text{max}} = 5.31\times10^9$ km ◀

PROBLEM 12.109

Based on observations made during the 1996 sighting of comet Hyakutake, it was concluded that the trajectory of the comet is a highly elongated ellipse for which the eccentricity is approximately $\varepsilon = 0.999887$. Knowing that for the 1996 sighting the minimum distance between the comet and the sun was $0.230R_E$, where R_E is the mean distance from the sun to the earth, determine the periodic time of the comet.

SOLUTION

For Earth's orbit about the sun,

$$v_0 = \sqrt{\frac{GM}{R_E}}, \quad \tau_0 = \frac{2\pi R_E}{v_0} = \frac{2\pi R_E^{3/2}}{\sqrt{GM}} \quad \text{or} \quad \sqrt{GM} = \frac{2\pi R_E^{3/2}}{\tau_0} \qquad (1)$$

For the comet Hyakutake,

$$\frac{1}{r_0} = \frac{GM}{h^2} = (1+\varepsilon), \quad \frac{1}{r_1} = \frac{GM}{h^2}(1+\varepsilon), \quad r_1 = \frac{1+\varepsilon}{1-\varepsilon} r_0$$

$$a = \frac{1}{2}(r_0 + r_1) = \frac{r_0}{1-\varepsilon}, \quad b = \sqrt{r_0 r_1} = \sqrt{\frac{1+\varepsilon}{1-\varepsilon}}\, r_0$$

$$h = \sqrt{GMr_0(1+\varepsilon)}$$

$$\tau = \frac{2\pi ab}{h} = \frac{2\pi r_0^2 (1+\varepsilon)^{1/2}}{(1-\varepsilon)^{3/2}\sqrt{GMr_0(1+\varepsilon)}}$$

$$= \frac{2\pi r_0^{3/2}}{\sqrt{GM}\,(1-\varepsilon)^{3/2}} = \frac{2\pi r_0^{3/2}\tau_0}{2\pi R_E^3 (1-\varepsilon)^{3/2}}$$

$$= \left(\frac{r_0}{R_E}\right)^{3/2} \frac{1}{(1-\varepsilon)^{3/2}}\, \tau_0$$

$$= (0.230)^{3/2} \frac{1}{(1-0.999887)^{3/2}}\, \tau_0 = 91.8 \times 10^3 \tau_0$$

Since $\tau_0 = 1$ yr, $\tau = (91.8 \times 10^3)(1.000)$ $\qquad \tau = 91.8 \times 10^3$ yr ◀

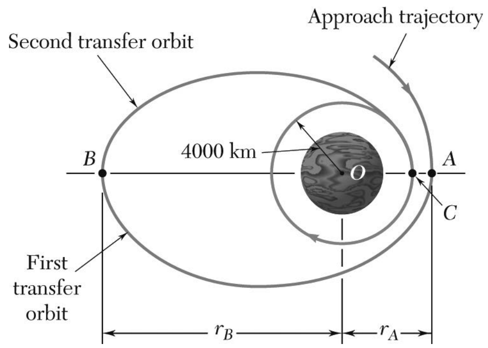
PROBLEM 12.110



A space probe is to be placed in a circular orbit of radius 4000 km about the planet Mars. As the probe reaches A, the point of its original trajectory closest to Mars, it is inserted into a first elliptic transfer orbit by reducing its speed. This orbit brings it to Point B with a much reduced velocity. There the probe is inserted into a second transfer orbit by further reducing its speed. Knowing that the mass of Mars is 0.1074 times the mass of the earth, that r_A = 9000 km and r_B = 180,000 km, and that the probe approaches A on a parabolic trajectory, determine the time needed for the space probe to travel from A to B on its first transfer orbit.

SOLUTION

For earth, $R = 6373 \text{ km} = 6.373 \times 10^6 \text{ m}$

$$GM = gR^2 = (9.81)(6.373 \times 10^6)^2 = 398.43 \times 10^{12} \text{ m}^3/\text{s}^2$$

For Mars, $GM = (0.1074)(398.43 \times 10^{12}) = 42.792 \times 10^{12} \text{ m}^3/\text{s}^2$

$$r_A = 9000 \text{ km} = 9.0 \times 10^6 \text{ m} \qquad r_B = 180000 \text{ km} = 180 \times 10^6 \text{ m}$$

For the parabolic approach trajectory at A,

$$(v_A)_1 = \sqrt{\frac{2GM}{r_A}} = \sqrt{\frac{(2)(42.792 \times 10^{12})}{9.0 \times 10^6}} = 3.0837 \times 10^3 \text{ m/s}$$

First elliptic transfer orbit AB.

Using Eq. (12.39), $\dfrac{1}{r_A} = \dfrac{GM}{h_{AB}^2} + C\cos\theta_A$ and $\dfrac{1}{r_B} = \dfrac{GM}{h_{AB}^2} + C\cos\theta_B$.

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B$.

Adding, $\dfrac{1}{r_A} + \dfrac{1}{r_B} = \dfrac{r_A + r_B}{r_A r_B} = \dfrac{2GM}{h_{AB}^2}$

$$h_{AB} = \sqrt{\frac{2GMr_A r_B}{r_A + r_B}} = \sqrt{\frac{(2)(42.792 \times 10^{12})(9.0 \times 10^6)(180 \times 10^6)}{189.0 \times 10^6}}$$

$$h_{AB} = 27.085 \times 10^9 \text{ m}^2/\text{s}$$

$$a = \frac{1}{2}(r_A + r_B) = \frac{1}{2}(9.0 \times 10^6 + 180 \times 10^6) = 94.5 \times 10^6 \text{ m}$$

$$b = \sqrt{r_A r_B} = \sqrt{(9.0 \times 10^6)(180 \times 10^6)} = 40.249 \times 10^6 \text{ m}$$

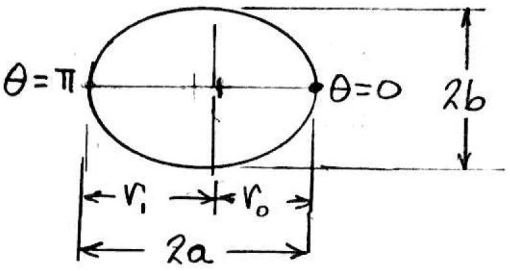
PROBLEM 12.111

A space shuttle is in an elliptic orbit of eccentricity 0.0356 and a minimum altitude of 300 km above the surface of the earth. Knowing that the radius of the earth is 6370 km, determine the periodic time for the orbit.

SOLUTION

For earth, $g = 9.81 \text{ m/s}^2, \quad R = 6370 \text{ km} = 6.370 \times 10^6 \text{ m}$

$$\text{GM} = gR^2 = (9.81)(6.370 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$



For the orbit, $r_0 = 6370 + 300 = 6670 \text{ km} = 6.670 \times 10^6 \text{ m}$

$$\frac{1}{r_0} = \frac{GM}{h^2}(1+\varepsilon) \qquad \frac{1}{r_1} = \frac{GM}{h^2}(1-\varepsilon)$$

$$r_1 = r_0\frac{1+\varepsilon}{1-\varepsilon} - (6.670 \times 10^6)\frac{1.0356}{0.9644} = 7.1624 \times 10^6 \text{ m}$$

$$a = \frac{1}{2}(r_0 + r_1) = 6.9162 \times 10^6 \text{ m}$$

$$b = \sqrt{r_0 r_1} = 6.9118 \times 10^6 \text{ m}$$

$$h = \sqrt{(1+\varepsilon)GMr_0} = \sqrt{(1.0356)(398.06 \times 10^{12})(6.670 \times 10^6)}$$

$$= 52.436400 \times 10^9 \text{ m}^2/\text{s}$$

$$\tau = \frac{2\pi ab}{h} = \frac{2\pi(6.9118 \times 10^6)(6.9162 \times 10^6)}{52.436400 \times 10^9 \text{ m}^2/\text{s}}$$

$$= 5.7281 \times 10^3 \text{ s}$$

$\tau = 95.5 \text{ min}$ ◀

PROBLEM 12.112

The Clementine spacecraft described an elliptic orbit of minimum altitude $h_A = 400\text{ km}$ and a maximum altitude of $h_B = 2940\text{ km}$ above the surface of the moon. Knowing that the radius of the moon is 1737 km and that the mass of the moon is 0.01230 times the mass of the earth, determine the periodic time of the spacecraft.

SOLUTION

For earth, $R = 6370\text{ km} = 6.370 \times 10^6\text{ m}$

$$GM = gR^2 = (9.81)(6.370 \times 10^6)^2 = 398.06 \times 10^{12}\text{ m}^3/\text{s}^2$$

For moon, $GM = (0.01230)(398.06 \times 10^{12}) = 4.896 \times 10^{12}\text{ m}^3/\text{s}^2$

$$r_A = 1737 + 400 = 2137\text{ km} = 2.137 \times 10^6\text{ m}$$

$$r_B = 1737 + 2940 = 4677\text{ km} = 4.677 \times 10^6\text{ m}$$

Using Eq. (12.39), $\dfrac{1}{r_A} = \dfrac{GM}{h^2} + C\cos\theta_A$ and $\dfrac{1}{r_B} = \dfrac{GM}{h^2} + C\cos\theta_B.$

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B.$

Adding, $\dfrac{1}{r_A} + \dfrac{1}{r_B} = \dfrac{r_A + r_B}{r_A r_B} = \dfrac{2GM}{h_{AB}^2}$

$$h_{AB} = \sqrt{\frac{2GMr_A r_B}{r_A + r_B}} = \sqrt{\frac{(2)(4.896 \times 10^{12})(2.137 \times 10^6)(4.677 \times 10^6)}{6.814 \times 10^6}}$$

$$= 3.78983 \times 10^9\text{ m}^2/\text{s}$$

$$a = \frac{1}{2}(r_A + r_B) = 3.402 \times 10^6\text{ m}$$

$$b = \sqrt{r_A r_B} = 3.16145 \times 10^6\text{ m}$$

Periodic time.

$$\tau = \frac{2\pi ab}{h_{AB}} = \frac{2\pi(3.402 \times 10^6)(3.16145 \times 10^6)}{3.78983 \times 10^9} = 17.831 \times 10^3\text{ s}$$

$\tau = 4.95\text{ h}$ ◀

PROBLEM 12.113

Determine the time needed for the space probe of Problem 12.100 to travel from B to C.

SOLUTION

From the solution to Problem 12.100, we have

$$(v_A)_{\text{par}} = 10{,}131.4 \text{ m/s}$$

and $$(v_A)_{\text{circ}} = \frac{1}{\sqrt{2}}(v_A)_{\text{par}} = 7164.0 \text{ m/s}$$

Also, $$r_A = (6052 + 280) \text{ km} = 6332 \text{ km}$$

For the parabolic trajectory BA, we have

$$\frac{1}{r} = \frac{GM_v}{h_{BA}^2}(1 + \varepsilon\cos\theta) \qquad \text{[Eq. (12.39′)]}$$

where $\varepsilon = 1$. Now

at A, $\theta = 0$: $$\frac{1}{r_A} = \frac{GM_v}{h_{BA}^2}(1+1)$$

or $$r_A = \frac{h_{BA}^2}{2GM_v}$$

at B, $\theta = -90°$: $$\frac{1}{r_B} = \frac{GM_v}{h_{BA}^2}(1+0)$$

or $$r_B = \frac{h_{BA}^2}{GM_v}$$

$$r_B = 2r_A$$

As the probe travels from B to A, the area swept out is the semiparabolic area defined by Vertex A and Point B. Thus,

$$(\text{Area swept out})_{BA} = A_{BA} = \frac{2}{3}r_A r_B = \frac{4}{3}r_A^2$$

Now $$\frac{dA}{dt} = \frac{1}{2}h$$

where $h = \text{constant}$

PROBLEM 12.114

A space probe is describing a circular orbit of radius nR with a velocity v_0 about a planet of radius R and center O. As the probe passes through Point A, its velocity is reduced from v_0 to βv_0, where $\beta < 1$, to place the probe on a crash trajectory. Express in terms of n and β the angle AOB, where B denotes the point of impact of the probe on the planet.

SOLUTION

For the circular orbit,
$$r_0 = r_A = nR$$
$$v_0 = \sqrt{\frac{GM}{r_0}} = \sqrt{\frac{GM}{nR}}$$

The crash trajectory is elliptic.

$$v_A = \beta v_0 = \sqrt{\frac{\beta^2 GM}{nR}}$$
$$h = r_A v_A = nRv_A = \sqrt{\beta^2 nGMR}$$
$$\frac{GM}{h^2} = \frac{1}{\beta^2 nR}$$
$$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta) = \frac{1+\varepsilon\cos\theta}{\beta^2 nR}$$

At Point A, $\theta = 180°$

$$\frac{1}{r_A} = \frac{1}{nR} = \frac{1-\varepsilon}{\beta^2 nR} \quad \text{or} \quad \beta^2 = 1-\varepsilon \quad \text{or} \quad \varepsilon = 1-\beta^2$$

At impact Point B, $\theta = \pi - \phi$

$$\frac{1}{r_B} = \frac{1}{R}$$
$$\frac{1}{R} = \frac{1+\varepsilon\cos(\pi-\phi)}{\beta^2 nR} = \frac{1-\varepsilon\cos\phi}{\beta^2 nR}$$

$$\varepsilon\cos\phi = 1-n\beta^2 \quad \text{or} \quad \cos\phi = \frac{1-n\beta^2}{\varepsilon} = \frac{1-n\beta^2}{1-\beta^2}$$

$$\phi = \cos^{-1}[(1-n\beta^2)/(1-\beta^2)] \blacktriangleleft$$

PROBLEM 12.115

A long-range ballistic trajectory between Points A and B on the earth's surface consists of a portion of an ellipse with the apogee at Point C. Knowing that Point C is 1500 km above the surface of the earth and the range $R\phi$ of the trajectory is 6000 km, determine (*a*) the velocity of the projectile at C, (*b*) the eccentricity ε of the trajectory.

SOLUTION

For earth, $R = 6370 \text{ km} = 6.37 \times 10^6 \text{ m}$

$$GM = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

For the trajectory, $r_C = 6370 + 1500 = 7870 \text{ km} = 7.87 \times 10^6 \text{ m}$

$$r_A = r_B = R = 6.37 \times 10^6 \text{ m}, \qquad \frac{r_C}{r_A} = \frac{7870}{6370} = 1.23548$$

Range A to B: $s_{AB} = 6000 \text{ km} = 6.00 \times 10^6 \text{ m}$

$$\varphi = \frac{s_{AB}}{R} = \frac{6.00 \times 10^6}{6.37 \times 10^6} = 0.94192 \text{ rad} = 53.968°$$

For an elliptic trajectory, $\dfrac{1}{r} = \dfrac{GM}{h^2}(1 + \varepsilon \cos\theta)$

At A, $\theta = 180° - \dfrac{\varphi}{2} = 153.016°$, $\dfrac{1}{r_A} = \dfrac{GM}{h^2}(1 + \varepsilon \cos 153.016°)$ (1)

At C, $\theta = 180°$, $\dfrac{1}{r_C} = \dfrac{GM}{h^2}(1 - \varepsilon)$ (2)

Dividing Eq. (1) by Eq. (2),

$$\frac{r_C}{r_A} = \frac{1 + \varepsilon \cos 153.016°}{1 - \varepsilon} = 1.23548$$

$$\varepsilon = \frac{1.23548 - 1}{1.23548 + \cos 153.016°} = 0.68384$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.115 (Continued)

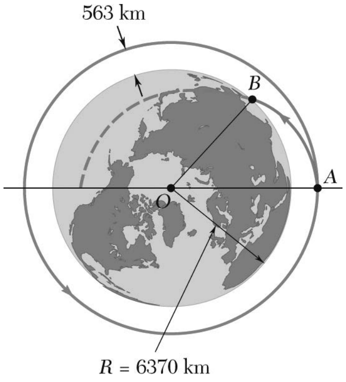
From Eq. (2), $h = \sqrt{GM(1-\varepsilon)r_C}$

$$h = \sqrt{(398.06\times 10^{12})(0.31616)(7.87\times 10^{6})} = 31.471\times 10^{9}\ \text{m}^2/\text{s}$$

(*a*) Velocity at *C*. $$v_C = \frac{h}{r_C} = \frac{31.471\times 10^{9}}{7.87\times 10^{6}} = 4.00\times 10^{3}\ \text{m/s}$$ $v_C = 4$ km/s ◀

(*b*) Eccentricity of trajectory. $\varepsilon = 0.684$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.116

A space shuttle is describing a circular orbit at an altitude of 563 km above the surface of the earth. As it passes through Point A, it fires its engine for a short interval of time to reduce its speed by 152 m/s and begin its descent toward the earth. Determine the angle AOB so that the altitude of the shuttle at Point B is 121 km. (*Hint:* Point A is the apogee of the elliptic descent trajectory.)

SOLUTION

$$GM = gR^2 = (9.81)(6.37\times 10^6)^2 = 398.06\times 10^{12}\ \text{m}^3/\text{s}^2$$

$$r_A = 6370 + 563 = 6933\ \text{km} = 6.933\times 10^6\ \text{m}$$

$$r_B = 6370 + 121 = 6491\ \text{km} = 6.491\times 10^6\ \text{m}$$

For the circular orbit through Point A,

$$v_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{398.06\times 10^{12}}{6.933\times 10^6}} = 7.5773\times 10^3\ \text{m/s}$$

For the descent trajectory,

$$v_A = v_{\text{circ}} + \Delta v = 7.5773\times 10^3 - 152 = 7.4253\times 10^3\ \text{m/s}$$

$$h = r_A v_A = (6.933\times 10^6)(7.4253\times 10^3) = 51.4795\times 10^9\ \text{m}^2/\text{s}$$

$$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta)$$

At Point A, $\theta = 180°$, $r = r_A$

$$\frac{1}{r_A} = \frac{GM}{h^2}(1-\varepsilon)$$

$$1-\varepsilon = \frac{h^2}{GM\ r_A} = \frac{(51.4795\times 10^9)^2}{(398.06\times 10^{12})(6.933\times 10^6)} = 0.96028$$

$$\varepsilon = 0.03972$$

$$\frac{1}{r_B} = \frac{GM}{h^2}(1+\varepsilon\cos\theta_B)$$

$$1+\varepsilon\cos\theta_B = \frac{h^2}{GM\ r_B} = \frac{(51.4795\times 10^9)^2}{(398.06\times 10^{12})(6.491\times 10^6)} = 1.02567$$

$$\cos\theta_B = \frac{1.02567-1}{\varepsilon} = 0.6463$$

$\theta_B = 49.7°$ $\quad\quad \measuredangle AOB = 180° - \theta_B = 130.3°$ $\quad\quad \measuredangle AOB = 130.3°$ ◀

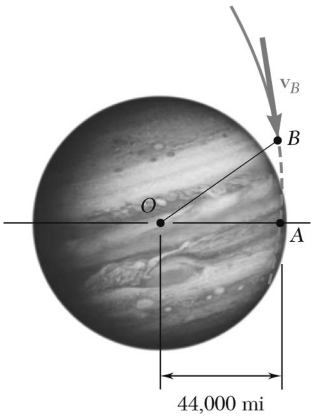
PROBLEM 12.117



As a spacecraft approaches the planet Jupiter, it releases a probe which is to enter the planet's atmosphere at Point B at an altitude of 280 mi above the surface of the planet. The trajectory of the probe is a hyperbola of eccentricity $\varepsilon = 1.031$. Knowing that the radius and the mass of Jupiter are 44423 mi and 1.30×10^{26} slug, respectively, and that the velocity $\mathbf{v}_B$ of the probe at B forms an angle of 82.9° with the direction of OA, determine (a) the angle AOB, (b) the speed v_B of the probe at B.

SOLUTION

First we note $\qquad r_B = (44.423 \times 10^3 + 280) \text{ mi} = 44.703 \times 10^3 \text{ mi}$

(a) We have $\qquad \dfrac{1}{r} = \dfrac{GM_j}{h^2}(1 + \varepsilon \cos \theta) \qquad$ [Eq. (12.39′)]

At A, $\theta = 0$: $\qquad \dfrac{1}{r_A} = \dfrac{GM_j}{h^2}(1 + \varepsilon)$

or $\qquad \dfrac{h^2}{GM_j} = r_A(1 + \varepsilon)$

At B, $\theta = \theta_B = \measuredangle AOB$: $\qquad \dfrac{1}{r_B} = \dfrac{GM_j}{h^2}(1 + \varepsilon \cos \theta_B)$

or $\qquad \dfrac{h^2}{GM_j} = r_B(1 + \varepsilon \cos \theta_B)$

Then $\qquad r_A(1 + \varepsilon) = r_B(1 + \varepsilon \cos \theta_B)$

or
$$\cos \theta_B = \frac{1}{\varepsilon}\left[\frac{r_A}{r_B}(1 + \varepsilon) - 1\right]$$
$$= \frac{1}{1.031}\left[\frac{44.0 \times 10^3 \text{ mi}}{44.703 \times 10^3 \text{ mi}}(1 + 1.031) - 1\right]$$
$$= 0.96902$$

or $\qquad \theta_B = 14.2988° \qquad\qquad \measuredangle AOB = 14.30°$ ◀

PROBLEM 12.118

A satellite describes an elliptic orbit about a planet. Denoting by r_0 and r_1 the distances corresponding, respectively, to the perigee and apogee of the orbit, show that the curvature of the orbit at each of these two points can be expressed as

$$\frac{1}{\rho} = \frac{1}{2}\left(\frac{1}{r_0} + \frac{1}{r_1}\right)$$

SOLUTION

Using Eq. (12.39), $$\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$$

and $$\frac{1}{r_B} = \frac{GM}{h^2} + C\cos\theta_B.$$

But $$\theta_B = \theta_A + 180°,$$

so that $$\cos\theta_A = -\cos\theta_B$$

Adding, $$\frac{1}{r_A} + \frac{1}{r_B} = \frac{2GM}{h^2}$$

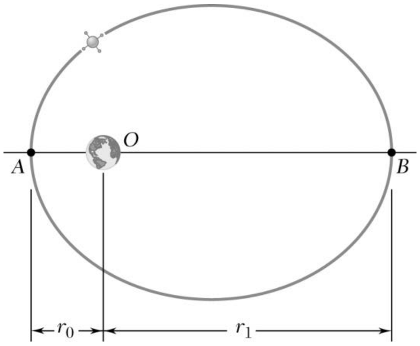
At Points A and B, the radial direction is normal to the path.

$$a_n = \frac{v^2}{\rho} = \frac{h^2}{r^2\rho}$$

But $$F_n = \frac{GMm}{r^2} = ma_n = \frac{mh^2}{r^2\rho}$$

$$\frac{1}{\rho} = \frac{GM}{h^2} = \frac{1}{2}\left(\frac{1}{r_A} + \frac{1}{r_B}\right) \qquad \frac{1}{\rho} = \frac{1}{2}\left(\frac{1}{r_0} + \frac{1}{r_1}\right) \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.119

(*a*) Express the eccentricity ε of the elliptic orbit described by a satellite about a planet in terms of the distances r_0 and r_1 corresponding, respectively, to the perigee and apogee of the orbit. (*b*) Use the result obtained in Part *a* and the data given in Problem 12.109, where $R_E = 149.6 \times 10^6$ km, to determine the approximate maximum distance from the sun reached by comet Hyakutake.

SOLUTION

(*a*) We have
$$\frac{1}{r} = \frac{GM}{h^2}(1 + \varepsilon \cos\theta) \qquad \text{Eq. (12.39}'\text{)}$$

At A, $\theta = 0$:
$$\frac{1}{r_0} = \frac{GM}{h^2}(1 + \varepsilon)$$

or
$$\frac{h^2}{GM} = r_0(1 + \varepsilon)$$

At B, $\theta = 180°$:
$$\frac{1}{r_1} = \frac{GM}{h^2}(1 - \varepsilon)$$

or
$$\frac{h^2}{GM} = r_1(1 - \varepsilon)$$

Then
$$r_0(1 + \varepsilon) = r_1(1 - \varepsilon)$$

or
$$\varepsilon = \frac{r_1 - r_0}{r_1 + r_0} \blacktriangleleft$$

(*b*) From above,
$$r_1 = \frac{1 + \varepsilon}{1 - \varepsilon} r_0$$

where
$$r_0 = 0.230 R_E$$

Then
$$r_1 = \frac{1 + 0.999887}{1 - 0.999887} \times 0.230(149.6 \times 10^9 \text{ m})$$

or
$$r_1 = 609 \times 10^{12} \text{ m} \blacktriangleleft$$

Note: $r_1 = 4070 R_E$ or $r_1 = 0.064$ lightyears.

If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.120

Derive Kepler's third law of planetary motion from Eqs. (12.39) and (12.45).

SOLUTION

For an ellipse, $2a = r_A + r_B \quad \text{and} \quad b = \sqrt{r_A r_B}$

Using Eq. (12.39), $$\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$$

and $$\frac{1}{r_B} = \frac{GM}{h^2} + C\cos\theta_B.$$

But $\theta_B = \theta_A + 180°,$

so that $\cos\theta_A = -\cos\theta_B.$

Adding, $$\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_A + r_B}{r_A r_B} = \frac{2a}{b^2} = \frac{2GM}{h^2}$$

$$h = b\sqrt{\frac{GM}{a}}$$

By Eq. (12.45),

$$\tau = \frac{2\pi ab}{h} = \frac{2\pi ab\sqrt{a}}{b\sqrt{GM}} = \frac{2\pi a^{3/2}}{\sqrt{GM}}$$

$$\tau^2 = \frac{4\pi^2 a^3}{GM}$$

For Orbits 1 and 2 about the same large mass,

$$\tau_1^2 = \frac{4\pi^2 a_1^3}{GM}$$

and $$\tau_2^2 = \frac{4\pi^2 a_2^3}{GM}$$

Forming the ratio, $$\left(\frac{\tau_1}{\tau_2}\right)^2 = \left(\frac{a_1}{a_2}\right)^3 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 12.121

Show that the angular momentum per unit mass h of a satellite describing an elliptic orbit of semimajor axis a and eccentricity ε about a planet of mass M can be expressed as

$$h = \sqrt{GMa(1-\varepsilon^2)}$$

SOLUTION

By Eq. (12.39′), $$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta)$$

At A, $\theta = 0°$: $$\frac{1}{r_A} = \frac{GM}{h^2} = (1+\varepsilon) \qquad \text{or} \qquad r_A = \frac{h^2}{GM(1+\varepsilon)}$$

At B, $\theta = 180°$: $$\frac{1}{r_B} = \frac{GM}{h^2} = (1-\varepsilon) \qquad \text{or} \qquad r_B = \frac{h^2}{GM(1-\varepsilon)}$$

Adding, $$r_A + r_B = \frac{h^2}{GM} = \left(\frac{1}{1+\varepsilon} + \frac{1}{1-\varepsilon}\right) = \frac{2h^2}{GM(1-\varepsilon^2)}$$

But for an ellipse, $$r_A + r_B = 2a$$

$$2a = \frac{2h^2}{GM(1-\varepsilon^2)}$$

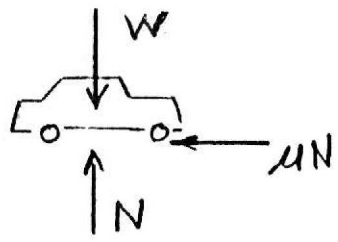
$$h = \sqrt{GMa(1-\varepsilon^2)} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.122

In the braking test of a sports car its velocity is reduced from 70 mi/h to zero in a distance of 170 ft with slipping impending. Knowing that the coefficient of kinetic friction is 80 percent of the coefficient of static friction, determine (*a*) the coefficient of static friction, (*b*) the stopping distance for the same initial velocity if the car skids. Ignore air resistance and rolling resistance.

SOLUTION



(*a*) Coefficient of static friction.

$$\Sigma F_y = 0: \quad N - W = 0 \qquad N = W$$

$$v_0 = 70 \text{ mi/h} = 102.667 \text{ ft/s}$$

$$\frac{v^2}{2} - \frac{v_0^2}{2} = a_t(s - s_0)$$

$$a_t = \frac{v^2 - v_0^2}{2(s - s_0)} = \frac{0 - (102.667)^2}{(2)(170)} = -31.001 \text{ ft/s}^2$$

For braking without skidding $\mu = \mu_s$, so that $\mu_s N = m|a_t|$

$$\xrightarrow{+} \Sigma F_t = ma_t: \quad -\mu_s N = ma_t$$

$$\mu_s = -\frac{ma_t}{W} = -\frac{a_t}{g} = \frac{31.001}{32.2} \qquad \mu_s = 0.963 \blacktriangleleft$$

(*b*) Stopping distance with skidding.

Use $\mu = \mu_k = (0.80)(0.963) = 0.770$

$$\xleftarrow{+} \Sigma F = ma_t: \quad \mu_k N = -ma_t$$

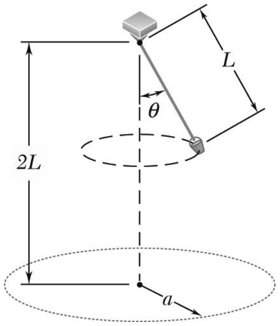
$$a_t = -\frac{\mu_k N}{m} = -\mu_k g = -24.801 \text{ ft/s}^2$$

Since acceleration is constant,

$$(s - s_0) = \frac{v^2 - v_0^2}{2a_t} = \frac{0 - (102.667)^2}{(2)(-24.801)}$$

$$s - s_0 = 212 \text{ ft} \blacktriangleleft$$

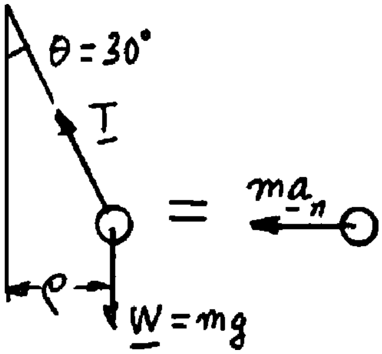
All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

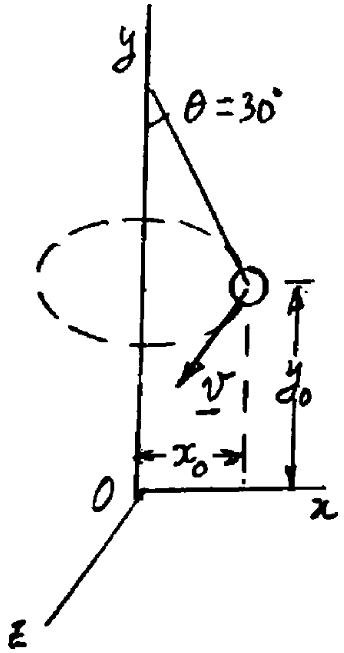


PROBLEM 12.123

A bucket is attached to a rope of length $L = 1.2$ m and is made to revolve in a horizontal circle. Drops of water leaking from the bucket fall and strike the floor along the perimeter of a circle of radius a. Determine the radius a when $\theta = 30°$.

SOLUTION





Initial velocity of drop = velocity of bucket

$$\Sigma F_y = 0: \qquad T\cos 30° = mg \tag{1}$$

$$\overset{+}{\longleftarrow} \Sigma F_x = ma_x: \qquad T\sin 30° = ma_n \tag{2}$$

Divide (2) by (1): $\quad \tan 30° = \dfrac{a_n}{g} = \dfrac{v^2}{\rho g}$

Thus $\qquad v^2 = \rho g \tan 30°$

But $\qquad \rho = L\sin 30° = (1.2 \text{ m}) \sin 30° = 0.6 \text{ m}$

Thus $\qquad v^2 = 0.6(9.81)\tan 30° = 3.398 \text{ m}^2/\text{s}^2 \qquad v = 1.843 \text{ m/s}$

Assuming the bucket to rotate clockwise (when viewed from above), and using the axes shown, we find that the components of the initial velocity of the drop are

$$(v_0)_x = 0, (v_0)_y = 0, (v_0)_2 = 1.843 \text{ m/s}$$

Free fall of drop

$$y = y_0 + (v_0)_y t - \frac{1}{2}gt^2 \qquad y = y_0 - \frac{1}{2}gt^2$$

When drop strikes floor:

$$y = 0 \qquad y_0 - \frac{1}{2}gt^2 = 0$$

But $\qquad y_0 = 2L - L\cos 30° = 2(1.2) - 1.2\cos 30° = 1.361 \text{ m}$

Thus $\qquad 1.361 - \dfrac{1}{2}(9.81)t^2 = 0 \qquad t = 0.5275$

PROBLEM 12.124

A 12-lb block *B* rests as shown on the upper surface of a 30-lb wedge *A*. Neglecting friction, determine immediately after the system is released from rest (*a*) the acceleration of *A*, (*b*) the acceleration of *B* relative to *A*.

SOLUTION

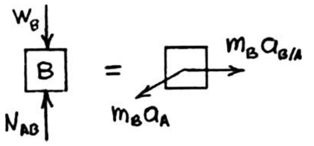
Acceleration vectors:

$$\mathbf{a}_A = a_A \swarrow 30°, \quad \mathbf{a}_{B/A} = a_{B/A} \longrightarrow$$

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

Block *B*:

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad m_B a_{B/A} - m_B a_A \cos 30° = 0$$



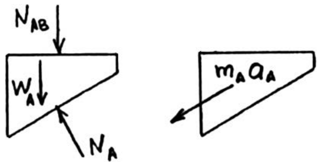
$$a_{B/A} = a_A \cos 30° \qquad (1)$$

$$+\!\downarrow \Sigma F_y = ma_y: \quad N_{AB} - W_B = -m_B a_A \sin 30°$$

$$N_{AB} = W_B - (W_B \sin 30°)\frac{a_A}{g} \qquad (2)$$

Block *A*:

$$+\!\swarrow \Sigma F = ma: \quad W_A \sin 30° + N_{AB} \sin 30° = W_A \frac{a_A}{g}$$



$$W_A \sin 30° + W_B \sin 30° - (W_B \sin^2 30°)\frac{a_A}{g} = W_A \frac{a_A}{g}$$

$$a_A = \frac{(W_A + W_B)\sin 30°}{W_A + W_B \sin^2 30°} g = \frac{(30+12)\sin 30°}{30 + 12\sin^2 30°}(32.2) = 20.49 \text{ ft/s}^2$$

(*a*) $\mathbf{a}_A = 20.49 \text{ ft/s}^2 \swarrow 30°$ ◀

$$a_{B/A} = (20.49)\cos 30° = 17.75 \text{ ft/s}^2$$

(*b*) $\mathbf{a}_{B/A} = 17.75 \text{ ft/s}^2 \longrightarrow$ ◀

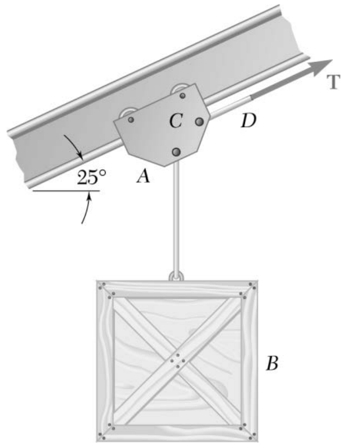
PROBLEM 12.125



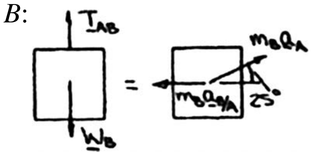
A 500-lb crate B is suspended from a cable attached to a 40-lb trolley A which rides on an inclined I-beam as shown. Knowing that at the instant shown the trolley has an acceleration of 1.2 ft/s^2 up and to the right, determine (*a*) the acceleration of B relative to A, (*b*) the tension in cable CD.

SOLUTION

(*a*) First we note: $\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$, where $\mathbf{a}_{B/A}$ is directed perpendicular to cable AB.

$$\xrightarrow{+} \Sigma F_x = m_B a_x: \quad 0 = -m_B a_x + m_B a_A \cos 25°$$

B:



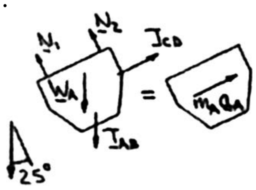
or $$a_{B/A} = (1.2 \text{ ft/s}^2)\cos 25°$$

or $$\mathbf{a}_{B/A} = 1.088 \text{ ft/s}^2 \longleftarrow \blacktriangleleft$$

(b) For crate B

$$+\uparrow \Sigma F_y = m_B a_y: \quad T_{AB} - W_B = \frac{W_B}{g} a_A \sin 25°$$

A:



or $$T_{AB} = (500 \text{ lb})\left[1 + \frac{(1.2 \text{ ft/s}^2)\sin 25°}{32.2 \text{ ft/s}^2}\right]$$

$$= 507.87 \text{ lb}$$

For trolley A

$$+\nearrow \Sigma F_x = m_A a_A: \quad T_{CD} - T_{AB}\sin 25° - W_A \sin 25° = \frac{W_A}{g} a_A$$

or $$T_{CD} = (507.87 \text{ lb})\sin 25° + (40 \text{ lb})\left(\sin 25° + \frac{1.2 \text{ ft/s}^2}{32.2 \text{ ft/s}^2}\right)$$

or $$T_{CD} = 233 \text{ lb} \blacktriangleleft$$

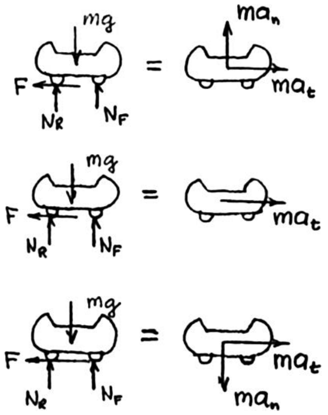
PROBLEM 12.126

The roller-coaster track shown is contained in a vertical plane. The portion of track between *A* and *B* is straight and horizontal, while the portions to the left of *A* and to the right of *B* have radii of curvature as indicated. A car is traveling at a speed of 72 km/h when the brakes are suddenly applied, causing the wheels of the car to slide on the track ($\mu_k = 0.25$). Determine the initial deceleration of the car if the brakes are applied as the car (*a*) has almost reached *A*, (*b*) is traveling between *A* and *B*, (*c*) has just passed *B*.

SOLUTION



$$v = 72 \text{ km/h} = 20 \text{ m/s}$$

(*a*) Almost reached Point *A*. $\rho = 30$ m

$$a_n = \frac{v^2}{\rho} = \frac{(20)^2}{30} = 13.333 \text{ m/s}^2 \uparrow$$

$$\Sigma F_y = ma_y: \quad N_R + N_F - mg = ma_n$$

$$N_R + N_F = m(g + a_n)$$

$$F = \mu_k (N_R + N_F) = \mu_k m(g + a_n)$$

$$\xrightarrow{+} \Sigma F_x = ma_x: \quad -F = ma_t$$

$$a_t = -\frac{F}{m} = -\mu_k (g + a_n)$$

$$|a_t| = \mu_k (g + a_n) = 0.25(9.81 + 13.33) \qquad |a_t| = 5.79 \text{ m/s}^2 \blacktriangleleft$$

(*b*) Between *A* and *B*. $\rho = \infty$

$$a_n = 0$$

$$|a_t| = \mu_k g = (0.25)(9.81) \qquad |a_t| = 2.45 \text{ m/s}^2 \blacktriangleleft$$

(*c*) Just passed Point *B*. $\rho = 45$ m

$$a_n = \frac{v^2}{\rho} = \frac{(20)^2}{45} = 8.8889 \text{ m/s}^2 \downarrow$$

$$\Sigma F_y = ma_y: \quad N_R + N_F - mg = -ma_n$$

PROBLEM 12.127

The 100-g pin B slides along the slot in the rotating arm OC and along the slot DE which is cut in a fixed horizontal plate. Neglecting friction and knowing that rod OC rotates at the constant rate $\dot{\theta}_0 = 12$ rad/s, determine for any given value of θ (*a*) the radial and transverse components of the resultant force **F** exerted on pin B, (*b*) the forces **P** and **Q** exerted on pin B by rod OC and the wall of slot DE, respectively.

SOLUTION

Kinematics

From the drawing of the system, we have

$$r = \frac{0.2}{\cos\theta} \text{ m}$$

Then
$$\dot{r} = \left(0.2\frac{\sin\theta}{\cos^2\theta}\dot{\theta}\right) \text{ m/s} \qquad \dot{\theta} = 12 \text{ rad/s}$$

and
$$\ddot{\theta} = 0$$

$$\ddot{r} = 0.2\,\frac{\cos\theta(\cos^2\theta) - \sin\theta(-2\cos\theta\sin\theta)}{\cos^4\theta}\,\dot{\theta}^2$$

$$= \left(0.2\frac{1+\sin^2\theta}{\cos^3\theta}\dot{\theta}^2\right) \text{ m/s}^2$$

Substituting for $\dot{\theta}$

$$\dot{r} = 0.2\frac{\sin\theta}{\cos^2\theta}(12) = \left(2.4\frac{\sin\theta}{\cos^2\theta}\right) \text{ m/s}$$

$$\ddot{r} = 0.2\frac{1+\sin^2\theta}{\cos^3\theta}(12)^2 = \left(28.8\frac{1+\sin^2\theta}{\cos^3\theta}\right) \text{ m/s}^2$$

Now
$$a_r = \ddot{r} - r\dot{\theta}^2$$

$$= \left(28.8\frac{1+\sin^2\theta}{\cos^3\theta}\right) - \left(\frac{0.2}{\cos\theta}\right)(12)^2$$

$$= \left(57.6\frac{\sin^2\theta}{\cos^3\theta}\right) \text{ m/s}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

and $$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

$$= 0 + 2\left(2.4\frac{\sin\theta}{\cos^2\theta}\right)(12)$$

$$= \left(57.6\frac{\sin\theta}{\cos^2\theta}\right)\text{m/s}^2$$

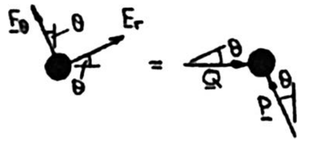
<u>Kinetics</u>

(*a*) We have $$F_r = m_B a_r = (0.1\text{ kg})\left[\left(57.6\frac{\sin^2\theta}{\cos^3\theta}\right)\text{m/s}^2\right]$$

or $$F_r = (5.76\text{ N})\tan^2\theta\sec\theta \blacktriangleleft$$

and $$F_\theta = m_B a_\theta = (0.1\text{ kg})\left[\left(57.6\frac{\sin\theta}{\cos^2\theta}\right)\text{m/s}^2\right]$$

or $$F_\theta = (5.76\text{ N})\tan\theta\sec\theta \blacktriangleleft$$



(*b*) Now $$+\uparrow \Sigma F_y: \quad F_\theta\cos\theta + F_r\sin\theta = P\cos\theta$$

or $$P = 5.76\tan\theta\sec\theta + (5.76\tan^2\theta\sec\theta)\tan\theta$$

or $$\mathbf{P} = (5.76\text{ N})\tan\theta\sec^2\theta \;\measuredangle\, \theta \blacktriangleleft$$

$$+\nearrow \Sigma F_r: \quad F_r = Q\cos\theta$$

or $$Q = (5.76\tan^2\theta\sec\theta)\frac{1}{\cos\theta}$$

or $$\mathbf{Q} = (5.76\text{ N})\tan^2\theta\sec^2\theta \longrightarrow \blacktriangleleft$$

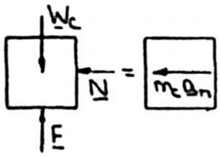
PROBLEM 12.128

A small 200-g collar C can slide on a semicircular rod which is made to rotate about the vertical AB at the constant rate of 6 rad/s. Determine the minimum required value of the coefficient of static friction between the collar and the rod if the collar is not to slide when (*a*) $\theta = 90°$, (*b*) $\theta = 75°$, (*c*) $\theta = 45°$. Indicate in each case the direction of the impending motion.

SOLUTION

First note
$$v_C = (r \sin\theta)\dot{\phi}_{AB}$$
$$= (0.6\text{ m})(6\text{ rad/s})\sin\theta$$
$$= (3.6\text{ m/s})\sin\theta$$

(*a*) With $\theta = 90°$, $\quad v_C = 3.6\text{ m/s}$



$$+\uparrow \Sigma F_y = 0: \quad F - W_C = 0$$

or
$$F = m_C g$$

Now
$$F = \mu_s N$$

or
$$N = \frac{1}{\mu_s} m_C g$$

$$\overset{+}{\longleftarrow} \Sigma F_n = m_C a_n: \quad N = m_C \frac{v_C^2}{r}$$

or
$$\frac{1}{\mu_s} m_C g = m_C \frac{v_C^2}{r}$$

or
$$\mu_s = \frac{gr}{v_C^2} = \frac{(9.81\text{ m/s}^2)(0.6\text{ m})}{(3.6\text{ m/s})^2}$$

or
$$(\mu_s)_{\min} = 0.454 \blacktriangleleft$$

The direction of the impending motion is downward. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

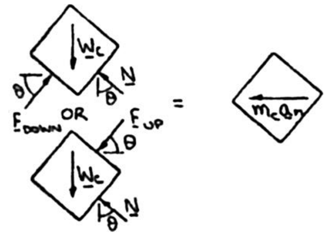
(*b*) and (*c*)

First observe that for an arbitrary value of θ, it is not known whether the impending motion will be upward or downward. To consider both possibilities for each value of θ, let F_{down} correspond to impending motion downward, F_{up} correspond to impending motion upward, then with the "top sign" corresponding to F_{down}, we have

$$+\uparrow \Sigma F_y = 0: \quad N\cos\theta \pm F\sin\theta - W_C = 0$$

Now $$F = \mu_s N$$

Then $$N\cos\theta \pm \mu_s N\sin\theta - m_C g = 0$$



or $$N = \frac{m_C g}{\cos\theta \pm \mu_s \sin\theta}$$

and $$F = \frac{\mu_s m_C g}{\cos\theta \pm \mu_s \sin\theta}$$

$$\overset{+}{\leftarrow} \Sigma F_n = m_C a_n: \quad N\sin\theta \mp F\cos\theta = m_C \frac{v_C^2}{\rho} \qquad \rho = r\sin\theta$$

Substituting for N and F

$$\frac{m_C g}{\cos\theta \pm \mu_s \sin\theta}\sin\theta \mp \frac{\mu_s m_C g}{\cos\theta \pm \mu_s \sin\theta}\cos\theta = m_C \frac{v_C^2}{r\sin\theta}$$

or $$\frac{\tan\theta}{1 \pm \mu_s \tan\theta} \mp \frac{\mu_s}{1 \pm \mu_s \tan\theta} = \frac{v_C^2}{gr\sin\theta}$$

or $$\mu_s = \pm \frac{\tan\theta - \frac{v_C^2}{gr\sin\theta}}{1 + \frac{v_C^2}{gr\sin\theta}\tan\theta}$$

Now $$\frac{v_C^2}{gr\sin\theta} = \frac{[(3.6 \text{ m/s})\sin\theta]^2}{(9.81 \text{ m/s}^2)(0.6 \text{ m})\sin\theta} = 2.2018\sin\theta$$

Then $$\mu_s = \pm \frac{\tan\theta - 2.2018\sin\theta}{1 + 2.2018\sin\theta\tan\theta}$$

(*b*) $\theta = 75°$

$$\mu_s = \pm \frac{\tan 75° - 2.2018\sin 75°}{1 + 2.2018\sin 75°\tan 75°} = \pm 0.1796$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.128 (Continued)

Then

downward: $\mu_s = +0.1796$

upward: $\mu_s < 0$ not possible

$(\mu_s)_{\min} = 0.1796$ ◀

The direction of the impending motion is downward. ◀

(c) $\theta = 45°$

$$\mu_s = \pm\frac{\tan 45° - 2.2018\sin 45°}{1 + 2.2018\sin 45°\tan 45°} = \pm(-0.218)$$

Then

downward: $\mu_s < 0$ not possible

upward: $\mu_s = 0.218$ $(\mu_s)_{\min} = 0.218$ ◀

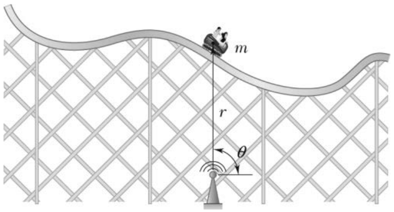
The direction of the impending motion is upward. ◀

Note: When $\tan\theta - 2.2018\sin\theta = 0$

or $\theta = 62.988°$,

$\mu_s = 0.$ Thus, for this value of θ, friction is not necessary to prevent the collar from sliding on the rod.

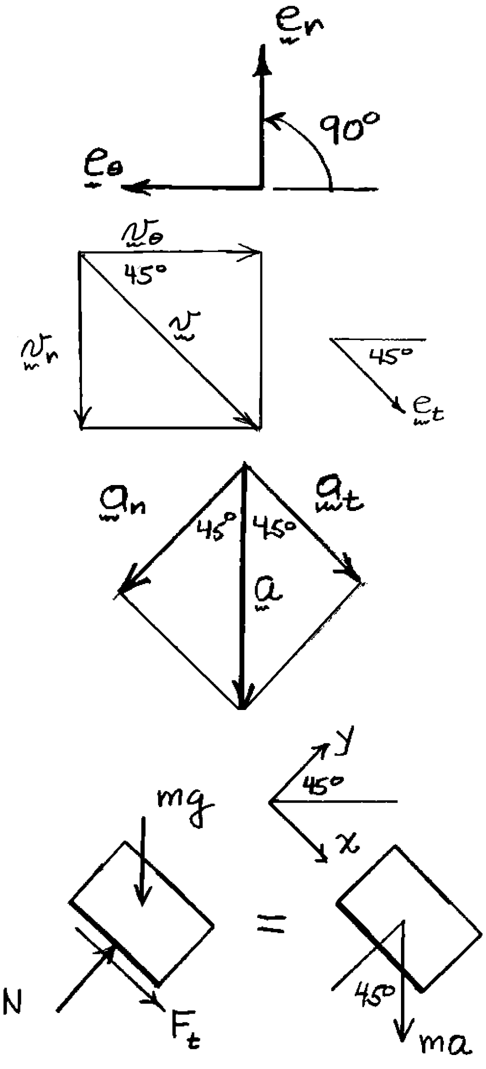
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.129

Telemetry technology is used to quantify kinematic values of a 200-kg roller coaster cart as it passes overhead. According to the system, $r = 25$ m, $\dot{r} = -10$ m/s, $\ddot{r} = -2$ m/s^2, $\ddot{\theta} = 90°$, $\dot{\theta} = -0.4$ rad/s, $\dot{\theta} = -0.32$ rad/s^2. At this instant, determine (*a*) the normal force between the cart and the track, (*b*) the radius of curvature of the track.

SOLUTION



Find the acceleration and velocity using polar coordinates.

$$v_r = \dot{r} = -10 \text{ m/s}$$

$$v_\theta = r\dot{\theta} = (25 \text{ m})(-0.4 \text{ rad/s}) = -10 \text{ m/s}$$

So the tangential direction is ⦪ 45° and $v = 10\sqrt{2}$ m/s.

$$a_r = \ddot{r} - r\dot{\theta}^2 = -2 \text{ m/s} - (25 \text{ m})(-0.4 \text{ rad/s})^2$$

$$= -6 \text{ m/s}^2$$

$$a_\theta = r\ddot{\theta} + 2\dot{r}\dot{\theta}$$

$$= (25 \text{ m})(-0.32) \text{ rad/s}^2| + 2(-10 \text{ m/s})(-0.4 \text{ rad/s})$$

$$= 0$$

So the acceleration is vertical and downward.

(*a*) To find the normal force use Newton's second law.

y-direction

$$N - mg\sin 45° = -ma\cos 45°$$

$$N = m(g\sin 45° - a\cos 45°)$$

$$= (200 \text{ kg})(9.81) \text{ m/s}^2 - 6 \text{ m/s}^2)(0.70711)$$

$$= 538.815 \text{ N}$$

$N = 539$ N ◀

(*b*) Radius l curvature of the track.

$$a_n = \frac{v^2}{\rho}$$

$$\rho = \frac{v^2}{a_n} = \frac{(10\sqrt{2})^2}{6\cos 45°}$$

$\rho = 47.1$ m ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.130

The radius of the orbit of a moon of a given planet is equal to twice the radius of that planet. Denoting by ρ the mean density of the planet, show that the time required by the moon to complete one full revolution about the planet is $(24\,\pi/G\rho)^{1/2}$, where G is the constant of gravitation.

SOLUTION

For gravitational force and a circular orbit,

$$|F_r| = \frac{GMm}{r^2} = \frac{mv^2}{r} \qquad \text{or} \qquad v = \sqrt{\frac{GM}{r}}$$

Let τ be the periodic time to complete one orbit.

$$v\tau = 2\pi r \qquad \text{or} \qquad \tau\sqrt{\frac{GM}{r}} = 2\pi r$$

Solving for τ,
$$\tau = \frac{2\pi r^{3/2}}{\sqrt{GM}}$$

But
$$M = \frac{4}{3}\pi R^3 \rho, \quad \text{hence,} \quad \sqrt{GM} = 2\sqrt{\frac{\pi}{3}G\rho}\; R^{3/2}$$

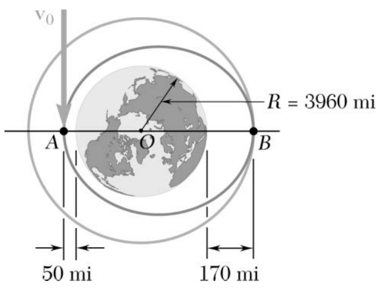
Then
$$\tau = \sqrt{\frac{3\pi}{G\rho}}\left(\frac{r}{R}\right)^{3/2}$$

Using $r = 2R$ as a given leads to

$$\tau = 2^{3/2}\sqrt{\frac{3\pi}{G\rho}} = \sqrt{\frac{24\pi}{G\rho}}$$

$\tau = (24\pi/G\rho)^{1/2}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 12.131

At engine burnout on a mission, a shuttle had reached Point A at an altitude of 40 mi above the surface of the earth and had a horizontal velocity $\mathbf{v}_0$. Knowing that its first orbit was elliptic and that the shuttle was transferred to a circular orbit as it passed through Point B at an altitude of 170 mi, determine (a) the time needed for the shuttle to travel from A to B on its original elliptic orbit, (b) the periodic time of the shuttle on its final circular orbit.

SOLUTION

For Earth, $R = 3960 \text{ mi} = 20.909\times10^6 \text{ ft}, \quad g = 32.2 \text{ ft/s}^2$

$$GM = gR^2 = (32.2)(20.909\times10^6)^2 = 14.077\times10^{15} \text{ ft}^3/\text{s}^2$$

(a) For the elliptic orbit, $r_A = 3960 + 40 = 4000 \text{ mi} = 21.12\times10^6 \text{ ft}$

$$r_B = 3960 + 170 = 4130 \text{ mi} = 21.8064\times10^6 \text{ ft}$$

$$a = \frac{1}{2}(r_A + r_B) = 21.5032\times10^6 \text{ ft}$$

$$b = \sqrt{r_A r_B} = 21.4605\times10^6 \text{ ft}$$

Using Eq. 12.39, $$\frac{1}{r_A} = \frac{GM}{h^2} + C\cos\theta_A$$

and $$\frac{1}{r_B} = \frac{GM}{r_B^2} + C\cos\theta_B$$

But $\theta_B = \theta_A + 180°$, so that $\cos\theta_A = -\cos\theta_B$

Adding, $$\frac{1}{r_A} + \frac{1}{r_B} = \frac{r_A + r_B}{r_A r_B} = \frac{2a}{b^2} = \frac{2GM}{h^2}$$

or $$h = \sqrt{\frac{GMb^2}{a}}$$

Periodic time. $$\tau = \frac{2\pi ab}{h} = \frac{2\pi ab\sqrt{a}}{\sqrt{GMb^2}} = \frac{2\pi a^{3/2}}{\sqrt{GM}}$$

$$\tau = \frac{2\pi(21.5032\times10^6)^{3/2}}{\sqrt{14.077\times10^{15}}} = 5280.6 \text{ s} = 1.4668 \text{ h}$$

The time to travel from A to B is one half the periodic time

$$\tau_{AB} = 0.7334 \text{ h}$$

$\tau_{AB} = 44.0 \text{ min}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 12.132

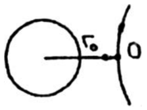
It was observed that as the Galileo spacecraft reached the point on its trajectory closest to Io, a moon of the planet Jupiter, it was at a distance of 1750 mi from the center of Io and had a velocity of 49.4×10^3 ft/s. Knowing that the mass of Io is 0.01496 times the mass of the earth, determine the eccentricity of the trajectory of the spacecraft as it approached Io.

SOLUTION



First note $$r_0 = 1750 \text{ mi} = 9.24\times10^6 \text{ ft}$$

$$R_{\text{earth}} = 3960 \text{ mi} = 20.9088\times10^6 \text{ ft}$$

We have $$\frac{1}{r} = \frac{GM}{h^2}(1+\varepsilon\cos\theta) \qquad \text{Eq. (12.39)}$$

At Point O, $$r = r_0, \quad \theta = 0, \quad h = h_0 = r_0 v_0$$

Also, $$GM_{Io} = G(0.01496 M_{\text{earth}})$$

$$= 0.01496 g R_{\text{earth}}^2 \qquad \text{using Eq. (12.30).}$$

Then $$\frac{1}{r_0} = \frac{0.01496 g R_{\text{earth}}^2}{(r_0 v_0)^2}(1+\varepsilon)$$

or $$\varepsilon = \frac{r_0 v_0^2}{0.01496 g R_{\text{earth}}^2} - 1$$

$$= \frac{(9.24\times10^6 \text{ ft})(49.4\times10^3 \text{ ft/s})^2}{0.01496(32.2 \text{ ft/s}^2)(20.9088\times10^6 \text{ ft})^2} - 1$$

or $$\varepsilon = 106.1 \blacktriangleleft$$

PROBLEM 12.133*

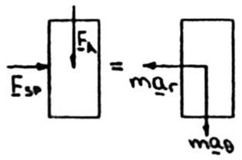
Disk A rotates in a horizontal plane about a vertical axis at the constant rate $\dot{\theta}_0 = 10$ rad/s. Slider B has mass 1 kg and moves in a frictionless slot cut in the disk. The slider is attached to a spring of constant k, which is undeformed when $r = 0$. Knowing that the slider is released with no radial velocity in the position $r = 500$ mm, determine the position of the slider and the horizontal force exerted on it by the disk at $t = 0.1$ s for (a) $k = 100$ N/m, (b) $k = 200$ N/m.

SOLUTION

First we note when $r = 0, \quad x_{sp} = 0 \Rightarrow F_{sp} = kr$

$$r_0 = 500 \text{ mm} = 0.5 \text{ m}$$

and $\dot{\theta} = \dot{\theta}_0 = 12$ rad/s



then $\ddot{\theta} = 0$

$$\overset{+}{\longleftarrow} \Sigma F_r = m_B a_r: \quad -F_{sp} = m_B(\ddot{r} - r\dot{\theta}_0^2)$$

$$\ddot{r} + \left(\frac{k}{m_B} - \dot{\theta}_0^2\right) r = 0 \qquad (1)$$

$$+\!\downarrow \Sigma F_\theta = m_B a_\theta: \quad F_A = m_B(0 + 2\dot{r}\dot{\theta}_0) \qquad (2)$$

(a) $k = 100$ N/m

Substituting the given values into Eq. (1)

$$\ddot{r} + \left[\frac{100 \text{ N/m}}{1 \text{ kg}} - (10 \text{ rad/s})^2\right] r = 0$$

$$\ddot{r} = 0$$

Then $\dfrac{d\dot{r}}{dt} = \ddot{r} = 0$ and at $t = 0, \dot{r} = 0$:

$$\int_0^{\dot{r}} d\dot{r} = \int_0^{0.1} (0)\, dt$$

$$\dot{r} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.133* (Continued)

and $\quad \dfrac{dr}{dt} = \dot{r} = 0$ and at $t = 0,\ r_0 = 0.5\ \text{m}$

$$\int_{r_0}^{r} dr = \int_0^{0.1} (0)\, dt$$

$$r = r_0$$

$r = 0.5\ \text{m}$ ◀

Note: $\dot{r} = 0$ implies that the slider remains at its initial radial position.

With $\dot{r} = 0$, Eq. (2) implies

$F_H = 0$ ◀

(*b*) $\quad k = 200\ \text{N/m}$

Substituting the given values into Eq. (1)

$$\ddot{r} + \left[\frac{200}{1\ \text{kg}} - (10\ \text{rad/s})^2\right] r = 0$$

$$\ddot{r} + 100\, r = 0$$

Now $\quad \ddot{r} = \dfrac{d}{dt}(\dot{r}) \qquad \dot{r} = v_r \qquad \dfrac{d}{dt} = \dfrac{dr}{dt}\dfrac{d}{dr} = v_r \dfrac{d}{dr}$

Then $\quad \ddot{r} = v_r \dfrac{dv_r}{dr}$

so that $\quad v_r \dfrac{dv_r}{dr} + 100r = 0$

At $t = 0,\ v_r = 0,\ r = r_0$: $\quad \displaystyle\int_0^{v_r} v_r d\, v_r = -100 \int_{r_0}^{r} r\, dr$

$$v_r^2 = -100(r^2 - r_0^2)$$

$$v_r = 10\sqrt{r_0^2 - r^2}$$

Now $\quad v_r = \dfrac{dr}{dt} = 10\sqrt{r_0^2 - r^2}$

At $t = 0,\ r = r_0$: $\quad \displaystyle\int_{r_0}^{r} \frac{dr}{\sqrt{r_0^2 - r^2}} = \int_0^t 10\, dt = 10t$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 12.133* (Continued)

Let $r = r_0 \sin\phi, \qquad dr = r_0 \cos\phi d\phi$

Then
$$\int_{\pi/2}^{\sin^{-1}(r/r_0)} \frac{r_0 \cos\phi d\phi}{\sqrt{r_0^2 - r_0^2 \sin^2\phi}} = 10t$$

$$\int_{\pi/2}^{\sin^{-1}(r/r_0)} d\phi = 10t$$

$$\sin^{-1}\left(\frac{r}{r_0}\right) - \frac{\pi}{2} = 10t$$

$$r = r_0 \sin\left(10t + \frac{\pi}{2}\right) = r_0 \cos 10t = (0.5 \text{ ft})\cos 10t$$

Then $\dot{r} = -(5 \text{ m/s})\sin 10t$

Finally, at $t = 0.1$ s:

$$r = (0.5 \text{ ft})\cos(10 \times 0.1)$$

$r = 0.270$ m ◀

Eq. (2) $F_H = 1 \text{ kg} \times 2 \times [-(5 \text{ ft/s})\sin(10 \times 0.1)]\ (10 \text{ rad/s})$

$F_H = -84.1$ N ◀

PROBLEM 13.1

A 400-kg satellite was placed in a circular orbit 1500 km above the surface of the earth. At this elevation the acceleration of gravity is 6.43 m/s^2. Determine the kinetic energy of the satellite, knowing that its orbital speed is 25.6×10^3 km/h.

SOLUTION

Mass of satellite: $m = 400 \text{ kg}$

Velocity: $v = 25.6\times10^3 \text{ km/h} = 7.111\times10^3 \text{ m/s}$

Kinetic energy: $T = \frac{1}{2}mv^2 = \frac{1}{2}(400 \text{ kg})(7.111\times10^3 \text{ m/s})^2$

$T = 10.113\times10^9 \text{ J}$ $\quad T = 10.11 \text{ GJ}$ ◀

Note: Acceleration of gravity has no effect on the mass of the satellite.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.2

A 1-lb stone is dropped down the "bottomless pit" at Carlsbad Caverns and strikes the ground with a speed of 95ft/s. Neglecting air resistance, determine (*a*) the kinetic energy of the stone as it strikes the ground and the height *h* from which it was dropped, (*b*) Solve Part *a* assuming that the same stone is dropped down a hole on the moon. (Acceleration of gravity on the moon = 5.31 ft/s^2.)

SOLUTION

Mass of stone: $m = \dfrac{W \text{ lb}}{g} = \dfrac{1 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.031056 \text{ lb} \cdot \text{s}^2/\text{ft}$

Initial kinetic energy: $T_1 = 0$ (rest)

(*a*) Kinetic energy at ground strike:

$$T_2 = \frac{1}{2} m v_2^2 = \frac{1}{2}(0.031056)(95)^2 = 140.14 \text{ ft} \cdot \text{lb}$$

$T_2 = 140.1 \text{ ft} \cdot \text{lb}$ ◀

Use work and energy: $T_1 + U_{1\to 2} = T_2$

where $U_{1\to 2} = wh = mgh$

$$0 + mgh = \frac{1}{2} m v_2^2$$

$$h = \frac{v_2^2}{2g} = \frac{(95)^2}{(2)(32.2)}$$

$h = 140.1 \text{ ft}$ ◀

(*b*) On the moon: $g = 5.31 \text{ ft/s}^2$

T_1 and T_2 will be the same, hence $T_2 = 140.1 \text{ ft} \cdot \text{lb}$ ◀

$$h = \frac{v_2^2}{2g} = \frac{(95)^2}{(2)(5.31)}$$

$h = 850 \text{ ft}$ ◀

PROBLEM 13.3

A baseball player hits a 5.1-oz baseball with an initial velocity of 140 ft/s at an angle of 40° with the horizontal as shown. Determine (*a*) the kinetic energy of the ball immediately after it is hit, (*b*) the kinetic energy of the ball when it reaches its maximum height, (*c*) the maximum height above the ground reached by the ball.

SOLUTION

Mass of baseball: $W = (5.1 \text{ oz})\left(\dfrac{1 \text{ lb}}{16 \text{ oz}}\right) = 0.31875 \text{ lb}$

$$m = \frac{W}{g} = \frac{0.31875 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.009899 \text{ lb} \cdot \text{s}^2/\text{ft}$$

(*a*) Kinetic energy immediately after hit.

$$v = v_0 = 140 \text{ ft/s}$$

$$T_1 = \frac{1}{2}mv^2 = \frac{1}{2}(0.009899)(140)^2 \qquad T_1 = 97.0 \text{ ft} \cdot \text{lb} \blacktriangleleft$$

(*b*) Kinetic energy at maximum height:

$$v = v_0 \cos 40° = 140 \cos 40° = 107.246 \text{ ft/s}$$

$$T_2 = \frac{1}{2}mv^2 = \frac{1}{2}(0.009899)(107.246)^2 \qquad T_2 = 56.9 \text{ ft} \cdot \text{lb} \blacktriangleleft$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$U_{1\to 2} = T_2 - T_1 = -40.082 \text{ ft} \cdot \text{lb}$$

Work of weight: $U_{1\to 2} = -Wd$

Maximum height above impact point.

$$d = \frac{T_2 - T_1}{-W} = \frac{-40.082 \text{ ft} \cdot \text{lb}}{-0.31875 \text{ lb}} = 125.7 \text{ ft} \qquad 125.7 \text{ ft} \blacktriangleleft$$

(*c*) Maximum height above ground:

$$h = 125.7 \text{ ft} + 2 \text{ ft} \qquad h = 127.7 \text{ ft} \blacktriangleleft$$

PROBLEM 13.4

A 500-kg communications satellite is in a circular geosynchronous orbit and completes one revolution about the earth in 23 h and 56 min at an altitude of 35800 km above the surface of the earth. Knowing that the radius of the earth is 6370 km, determine the kinetic energy of the satellite.

SOLUTION

Radius of earth: $R = 6370 \text{ km}$

Radius of orbit: $r = R + h = 6370 + 35800 = 42170 \text{ km} = 42.170 \times 10^6 \text{ m}$

Time one revolution: $t = 23 \text{ h} + 56 \text{ min}$

$$t = (23 \text{ h})(3600 \text{ s/h}) + (56 \text{ min})(60 \text{ s/min}) = 86.160 \times 10^3 \text{ s}$$

Speed: $$v = \frac{2\pi r}{t} = \frac{2\pi(42.170 \times 10^6)}{86.160 \times 10^3} = 3075.2 \text{ m/s}$$

Kinetic energy: $$T = \frac{1}{2} m v^2$$

$$T = \frac{1}{2}(500 \text{ kg})(3075.2 \text{ m/s})^2 = 2.3643 \times 10^9 \text{ J}$$

$T = 2.36 \text{ GJ}$ ◄

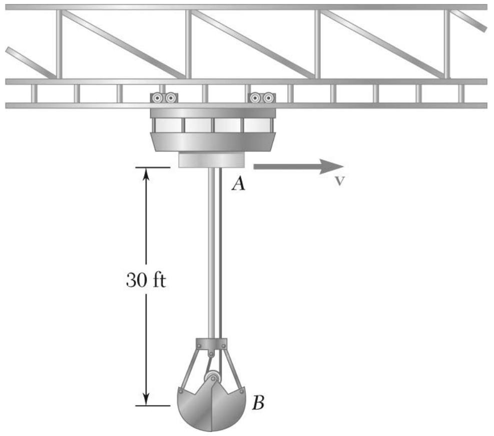
PROBLEM 13.5



In an ore-mixing operation, a bucket full of ore is suspended from a traveling crane which moves along a stationary bridge. The bucket is to swing no more than 10 ft horizontally when the crane is brought to a sudden stop. Determine the maximum allowable speed v of the crane.

SOLUTION

Let position ① be the position with bucket B directly below A, and position ② be that of maximum swing where $d = 10$ ft. Let L be the length AB.

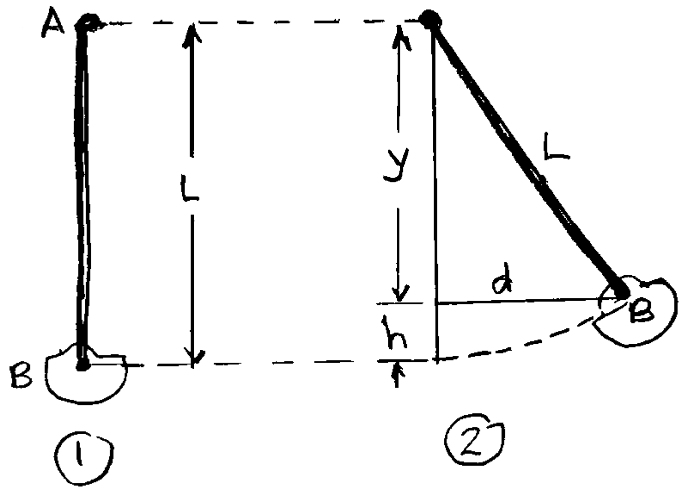
Kinetic energies: $$T_1 = \frac{1}{2}mv^2,\ T_2 = 0$$

Work of the weight: $$U_{1\to 2} = -Wh = -mgh$$

where h is the vertical projection of position ② above position ①

From geometry (see figure),

$$y = \sqrt{L^2 - d^2}$$
$$h = L - y$$
$$= L - \sqrt{L^2 - d^2}$$
$$= 30 - \sqrt{(30)^2 - (10)^2}$$
$$= 1.7157 \text{ ft}$$



Principle of work and energy: $$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}mv^2 - mgh = 0$$

$$v^2 = 2gh = (2)(32.2 \text{ ft/s}^2)(1.7157 \text{ ft}) = 110.49 \text{ ft}^2/\text{s}^2$$

$v = 10.51$ ft/s ◀

PROBLEM 13.7

Determine the maximum theoretical speed that may be achieved over a distance of 110 m by a car starting from rest assuming there is no slipping. The coefficient of static friction between the tires and pavement is 0.75, and 60 percent of the weight of the car is distributed over its front wheels and 40 percent over its rear wheels. Assume (*a*) front-wheel drive, (*b*) rear-wheel drive.

SOLUTION

Let W be the weight and m the mass. $\quad W = mg$

(*a*) *Front wheel drive*: $\quad N = 0.60W = 0.60mg$

$$\mu_s = 0.75$$

Maximum friction force without slipping:

$$F = \mu_s N = (0.75)(0.60W) = 0.45mg$$

$$U_{1\to 2} = Fd = 0.45mgd$$

$$T_1 = 0, \qquad T_2 = \frac{1}{2}mv_2^2$$

Principle of work and energy: $\quad T_1 + U_{1\to 2} = T_2$

$$0 + 0.45mgd = \frac{1}{2}mv_2^2$$

$$v_2^2 = (2)(0.45gd) = (2)(0.45)(9.81\text{ m/s}^2)(110\text{ m}) = 971.19\text{ m}^2/\text{s}^2$$

$$v_2 = 31.164\text{ m/s} \qquad v_2 = 112.2\text{ km/h} \blacktriangleleft$$

(*b*) *Rear wheel drive*: $\quad N = 0.40W = 0.40mg$

$$\mu_s = 0.75$$

Maximum friction force without slipping:

$$F = \mu_s N = (0.75)(0.40W) = 0.30mg$$

$$U_{1\to 2} = Fd = 0.30mgd$$

$$T_1 = 0, \qquad T_2 = \frac{1}{2}mv_2^2$$

Principle of work and energy: $\quad T_1 + U_{1\to 2} = T_2$

$$0 + 0.30mgd = \frac{1}{2}mv_2^2$$

$$v_2^2 = (2)(0.30)gd = (2)(0.30)(9.81\text{ m/s}^2)(110\text{ m}) = 647.46\text{ m}^2/\text{s}^2$$

$$v_2 = 25.445\text{ m/s} \qquad v_2 = 91.6\text{ km/h} \blacktriangleleft$$

Note: The car is treated as a particle in this problem. The weight distribution is assumed to be the same for static and dynamic conditions. Compare with sample Problem 16.1 where the vehicle is treated as a rigid body.

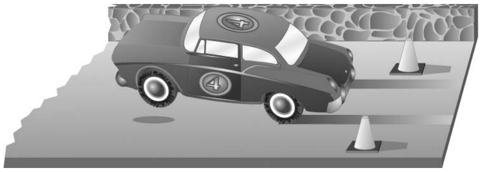
PROBLEM 13.8



Skid marks on a drag racetrack indicate that the rear (drive) wheels of a car slip for the first 20 m of the 400-m track. (*a*) Knowing that the coefficient of kinetic friction is 0.60, determine the speed of the car at the end of the first 20-m portion of the track if it starts from rest and the front wheels are just off the ground. (*b*) What is the maximum theoretical speed for the car at the finish line if, after skidding for 20 m, it is driven without the wheels slipping for the remainder of the race? Assume that while the car is rolling without slipping, 60 percent of the weight of the car is on the rear wheels and the coefficient of static friction is 0.75. Ignore air resistance and rolling resistance.

SOLUTION

(*a*) For the first 20 m, the normal force at the real wheels is equal to the weight of the car. Since the wheels are skidding, the friction force is

$$F = \mu_k N = \mu_k W = \mu_k mg$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$0 + Fd = \frac{1}{2}mv_2^2$$

$$0 + \mu_k mgd = \frac{1}{2}mv_2^2$$

$$v_2^2 = 2\mu_k gd = (2)(0.6)(9.81\text{ m/s}^2)(20\text{ m}) = 235.44\text{ m}^2/\text{s}^2$$

$$v_2 = 15.34\text{ m/s} \blacktriangleleft$$

(*b*) Assume that for the remainder of the race, sliding is impending and $N = 0.6\ W$

$$F = \mu_s N = \mu_s(0.6W) = (0.75)(0.6mg) = 0.45mg$$

Principle of work and energy: $T_2 + U_{2\to 3} = T_3$

$$\frac{1}{2}mv_2^2 + (0.45mg)d' = \frac{1}{2}mv_3^2$$

$$v_3^2 = v_2^2(2)(0.45)gd'$$

$$= 235.44\text{ m}^2/\text{s}^2 + (2)(0.45)(9.81\text{ m/s}^2)(400\text{ m} - 20\text{ m})$$

$$= 3590.5\text{ m}^2/\text{s}^2$$

$$v_3 = 59.9\text{ m/s} \blacktriangleleft$$

PROBLEM 13.9

A package is projected up a 15° incline at A with an initial velocity of 8 m/s. Knowing that the coefficient of kinetic friction between the package and the incline is 0.12, determine (*a*) the maximum distance d that the package will move up the incline, (*b*) the velocity of the package as it returns to its original position.

SOLUTION

(*a*) Up the plane from A to B:

$$T_A = \frac{1}{2}mv_A^2 = \frac{1}{2}\frac{W}{g}(8 \text{ m/s})^2 = 32\frac{W}{g} \qquad T_B = 0$$

$$U_{A-B} = (-W \sin 15° - F)d \qquad F = \mu_k N = 0.12\,\text{N}$$

$$\nwarrow \Sigma F = 0 \quad N - W\cos 15° = 0 \quad N = W\cos 15°$$

$$U_{A-B} = -W(\sin 15° + 0.12\cos 15°)d = -Wd(0.3747)$$

$$T_A + U_{A-B} = T_B: \quad 32\frac{W}{g} - Wd(0.3743) = 0$$

$$d = \frac{32}{(9.81)(0.3747)} \qquad d = 8.71 \text{ m} \blacktriangleleft$$

(*b*) Down the plane from B to A: (F reverses direction)

$$T_A = \frac{1}{2}\frac{W}{g}v_A^2 \qquad T_B = 0 \qquad d = 8.71 \text{ m/s}$$

$$U_{B-A} = (W \sin 15° - F)d$$

$$= W(\sin 15° - 0.12\cos 15°)(8.70 \text{ m/s})$$

$$U_{B-A} = 1.245W$$

$$T_B + U_{B-A} = T_A \quad 0 + 1.245W = \frac{1}{2}\frac{W}{g}v_A^2$$

$$v_A^2 = (2)(9.81)(1.245)$$

$$= 24.43$$

$$v_A = 4.94 \text{ m/s} \qquad \mathbf{v}_A = 4.94 \text{ m/s} \swarrow 15° \blacktriangleleft$$

PROBLEM 13.10

A 1.4 kg model rocket is launched vertically from rest with a constant thrust of 25 N until the rocket reaches an altitude of 15 m and the thrust ends. Neglecting air resistance, determine (*a*) the speed of the rocket when the thrust ends, (*b*) the maximum height reached by the rocket, (*c*) the speed of the rocket when it returns to the ground.

SOLUTION

Weight: $W = mg = (1.4)(9.81) = 13.734 \text{ N}$

(*a*) First stage: $T_1 = 0$

$$U_{1\to 2} = (25 - 13.734)(15) = 169.0 \text{ N}\cdot\text{m}$$

$$T_1 + U_{1\to 2} = T_2$$

$$T_2 = \frac{1}{2}mv^2 = U_{1\to 2} = 169.0 \text{ N}\cdot\text{m}$$

$$v_2 = \sqrt{\frac{2U_{1\to 2}}{m}} = \sqrt{\frac{(2)(169.0)}{1.4}}$$

$v_2 = 15.54 \text{ m/s}$ ◀

(*b*) Unpowered flight to maximum height *h*:

$$T_2 = 169.0 \text{ N}\cdot\text{m} \qquad T_3 = 0$$

$$U_{2\to 3} = -W(h - 15)$$

$$T_2 + U_{2\to 3} = T_3$$

$$W(h - 15) = T_2$$

$$h - 15 = \frac{T_2}{W} = \frac{169.0}{13.734}$$

$h = 27.3 \text{ m}$ ◀

(*c*) Falling from maximum height:

$$T_3 = 0 \qquad T_4 = \frac{1}{2}mv_4^2$$

$$U_{3\to 4} = Wh = mgh$$

$$T_3 = U_{3\to 4} = T_4: \quad 0 + mgh = \frac{1}{2}mv_4^2$$

$$v_4^2 = 2\,gh = (2)(9.81 \text{ m/s}^2)(27.3 \text{ m}) = 535.6 \text{ m}^2/\text{s}^2$$

$v_4 = 23.1 \text{ m/s}$ ◀

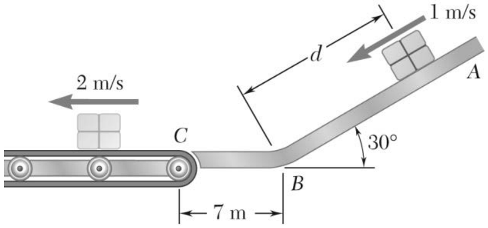
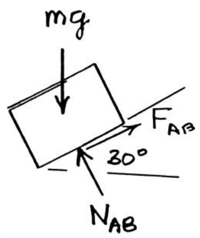
PROBLEM 13.11



Packages are thrown down an incline at A with a velocity of 1 m/s. The packages slide along the surface ABC to a conveyor belt which moves with a velocity of 2 m/s. Knowing that $\mu_k = 0.25$ between the packages and the surface ABC, determine the distance d if the packages are to arrive at C with a velocity of 2 m/s.

SOLUTION



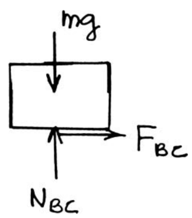
On incline AB:

$$N_{AB} = mg\cos 30°$$

$$F_{AB} = \mu_k N_{AB} = 0.25mg\ \cos 30°$$

$$U_{A\to B} = mgd\sin 30° - F_{AB}\,d$$

$$= mgd(\sin 30° - \mu_k \cos 30°)$$



On level surface BC:

$$N_{BC} = mg \qquad x_{BC} = 7 \text{ m}$$

$$F_{BC} = \mu_k mg$$

$$U_{B\to C} = -\mu_k mg\ x_{BC}$$

At A, $\quad T_A = \frac{1}{2}mv_A^2 \quad$ and $\quad v_A = 1$ m/s

At C, $\quad T_C = \frac{1}{2}mv_C^2 \quad$ and $\quad v_C = 2$ m/s

Assume that no energy is lost at the corner B.

Work and energy. $\quad T_A + U_{A\to B} + U_{B\to C} = T_C$

$$\frac{1}{2}mv_A^2 + mgd(\sin 30° - \mu_k \cos 30°) - \mu_k mg\ x_{BC} = \frac{1}{2}mv_0^2$$

Dividing by m and solving for d,

$$d = \frac{\left[v_C^2/2g + \mu_k x_{BC} - v_A^2/2g\right]}{(\sin 30° - \mu_k \cos 30°)}$$

$$= \frac{(2)^2/(2)(9.81) + (0.25)(7) - (1)^2/(2)(9.81)}{\sin 30° - 0.25\cos 30°}$$

$d = 6.71$ m ◀

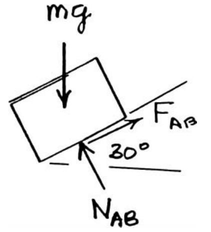
PROBLEM 13.12

Packages are thrown down an incline at A with a velocity of 1 m/s. The packages slide along the surface ABC to a conveyor belt which moves with a velocity of 2 m/s. Knowing that $d = 7.5$ m and $\mu_k = 0.25$ between the packages and all surfaces, determine (*a*) the speed of the package at C, (*b*) the distance a package will slide on the conveyor belt before it comes to rest relative to the belt.

SOLUTION

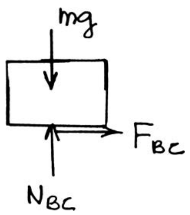
(*a*) On incline AB:

$$N_{AB} = mg\cos 30°$$
$$F_{AB} = \mu_k N_{AB} = 0.25mg\cos 30°$$
$$U_{A\to B} = mgd\sin 30° - F_{AB}\,d$$
$$= mgd(\sin 30° - \mu_k\cos 30°)$$



On level surface BC:

$$N_{BC} = mg \quad x_{BC} = 7 \text{ m}$$
$$F_{BC} = \mu_k mg$$
$$U_{B\to C} = -\mu_k mg\,x_{BC}$$



At A,

$$T_A = \frac{1}{2}mv_A^2 \quad \text{and} \quad v_A = 1 \text{ m/s}$$

At C,

$$T_C = \frac{1}{2}mv_C^2 \quad \text{and} \quad v_C = 2 \text{ m/s}$$

Assume that no energy is lost at the corner B.

Work and energy.

$$T_A + U_{A\to B} + U_{B\to C} = T_C$$

$$\frac{1}{2}mv_A^2 + mgd(\sin 30° - \mu_k\cos 30°) - \mu_k mg\,x_{BC} = \frac{1}{2}mv_0^2$$

Solving for v_C^2,

$$v_C^2 = v_A^2 + 2gd\,(\sin 30° - \mu_k\cos 30°) - 2\mu_k g\,x_{BC}$$
$$= (1)^2 + (2)(9.81)(7.5)(\sin 30° - 0.25\cos 30°) - (2)(0.25)(9.81)(7)$$
$$= 8.3811 \text{ m}^2/\text{s}^2$$

$v_C = 2.90$ m/s ◀

(*b*) Box on belt: Let x_{belt} be the distance moves by a package as it slides on the belt.

$$+\uparrow \Sigma F_y = ma_y \quad N - mg = 0 \quad N = mg$$
$$F_x = \mu_k N = \mu_k mg$$

At the end of sliding,

$$v = v_{\text{belt}} = 2 \text{ m/s}$$

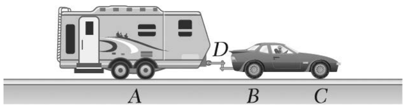
PROBLEM 13.15



A 1200-kg trailer is hitched to a 1400-kg car. The car and trailer are traveling at 72 km/h when the driver applies the brakes on both the car and the trailer. Knowing that the braking forces exerted on the car and the trailer are 5000 N and 4000 N, respectively, determine (*a*) the distance traveled by the car and trailer before they come to a stop, (*b*) the horizontal component of the force exerted by the trailer hitch on the car.

SOLUTION

Let position 1 be the initial state at velocity $v_1 = 72$ km/h $= 20$ m/s and position 2 be at the end of braking ($v_2 = 0$). The braking forces and $F_C = 5000$ N for the car and 4000 N for the trailer.

(*a*) Car and trailer system. (d = braking distance)

$$T_1 = \frac{1}{2}(m_C + m_T)v_1^2 \qquad T_2 = 0$$

$$U_{1\to 2} = -(F_C + F_T)d$$

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}(m_C + m_T)v_1^2 - (F_C + F_T)d = 0$$

$$d = \frac{(m_C + m_T)v_1^2}{2(F_C + F_T)} = \frac{(2600)(20)^2}{(2)(9000)} = 57.778 \qquad d = 57.8 \text{ m} \blacktriangleleft$$

(*b*) Car considered separately.

Let H be the horizontal pushing force that the trailer exerts on the car through the hitch.

$$T_1 = \frac{1}{2}m_C v_1^2 \qquad T_2 = 0$$

$$U_{1\to 2} = (H - F_C)d$$

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}m_C v_1^2 + (H - F_C)d = 0$$

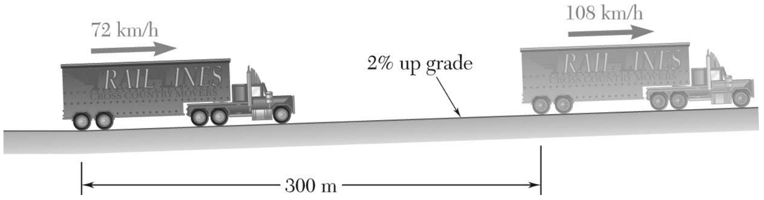
$$H = F_C - \frac{m_C v_1^2}{2d} = 5000 - \frac{(1400)(20)^2}{(2)(57.778)}$$

Trailer hitch force on car: $\mathbf{H} = 154 \text{ N} \longrightarrow \blacktriangleleft$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.16

A trailer truck enters a 2 percent uphill grade traveling at 72 km/h and reaches a speed of 108 km/h in 300 m. The cab has a mass of 1800 kg and the trailer 5400 kg. Determine (*a*) the average force at the wheels of the cab, (*b*) the average force in the coupling between the cab and the trailer.



SOLUTION

Initial speed: $v_1 = 72 \text{ km/h} = 20 \text{ m/s}$

Final speed: $v_2 = 108 \text{ km/h} = 30 \text{ m/s}$

Vertical rise: $h = (0.02)(300) = 6.00 \text{ m}$

Distance traveled: $d = 300 \text{ m}$

(*a*) Traction force. Use cab and trailer as a free body.

$$m = 1800 + 5400 = 7200 \text{ kg} \qquad W = mg = (7200)(9.81) = 70.632 \times 10^3 \text{ N}$$

Work and energy: $T_1 + U_{1\to 2} = T_2 \qquad \frac{1}{2}mv_1^2 - Wh + F_t d = \frac{1}{2}mv_2^2$

$$F_t = \frac{1}{d}\left[\frac{1}{2}mv_1^2 + Wh - mv_1^2\right] = \frac{1}{300}\left[\frac{1}{2}(7200)(30)^2 + (70.632 \times 10^3)(6.00) - \frac{1}{2}(7200)(20)^2\right]$$

$$= 7.4126 \times 10^3 \text{ N} \qquad F_t = 7.41 \text{ kN} \blacktriangleleft$$

(*b*) Coupling force F_c. Use the trailer alone as a free body.

$$m = 5400 \text{ kg} \qquad W = mg = (5400)(9.81) = 52.974 \times 10^3 \text{ N}$$

Assume that the tangential force at the trailer wheels is zero.

Work and energy: $T_1 + U_{1\to 2} = T_2 \qquad \frac{1}{2}mv_1^2 - Wh + F_c d = \frac{1}{2}mv_2^2$

The plus sign before F_c means that we have assumed that the coupling is in tension.

$$F_c = \frac{1}{d}\left[\frac{1}{2}mv_2^2 + Wh - \frac{1}{2}mv_1^2\right] = \frac{1}{300}\left[\frac{1}{2}(5400)(30)^2 + (52.974 \times 10^3)(6.00) - \frac{1}{2}(5400)(20)^2\right]$$

$$= 5.5595 \times 10^3 \text{ N} \qquad F_c = 5.56 \text{ kN (tension)} \blacktriangleleft$$

PROBLEM 13.19

Blocks A and B weigh 25 lbs and 10 lbs, respectively, and they are both at a height 6 ft above the ground when the system is released from rest. Just before hitting the ground block A is moving at a speed of 9 ft/s. Determine (a) the amount of energy dissipated in friction by the pulley, (b) the tension in each portion of the cord during the motion.

SOLUTION

By constraint of the cable block B moves up a distance h when block A moves down a distance h. ($h = 6$ ft) Their speeds are equal.

Let F_A and F_B be the tensions on the A and B sides, respectively, of the pulley.

Masses: $$M_A = \frac{W_A}{g} = \frac{25}{32.2} = 0.7764 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$M_B = \frac{W_B}{g} = \frac{10}{32.2} = 0.31056 \text{ lb} \cdot \text{s}^2/\text{ft}$$

Let position 1 be the initial position with both blocks a distance h above the ground and position 2 be just before block A hits the ground.

Kinetic energies: $$(T_1)_A = 0, \qquad (T_1)_B = 0$$

$$(T_2)_A = \frac{1}{2}m_A v^2 = \frac{1}{2}(0.7764)(9)^2 = 31.444 \text{ ft} \cdot \text{lb}$$

$$(T_2)_B = \frac{1}{2}m_B v^2 = \frac{1}{2}(0.31056)(9)^2 = 12.578 \text{ ft} \cdot \text{lb}$$

Principle of work and energy: $$T_1 + U_{1\to 2} = T_2$$

Block A: $$U_{1\to 2} = (W_A - F_A)h$$

$$0 + (25 - F_A)(6) = 31.444 \qquad F_A = 19.759 \text{ lb}$$

Block B: $$U_{1\to 2} = (F_B - W_B)h$$

$$0 + (F_B - 10)(6) = 12.578 \qquad F_B = 12.096 \text{ lb}$$

At the pulley F_A moves a distance h down, and F_B moves a distance h up. The work done is

$$U_{1\to 2} = (F_A - F_B)h = (19.759 - 12.096)(6) = 46.0 \text{ ft} \cdot \text{lb}$$

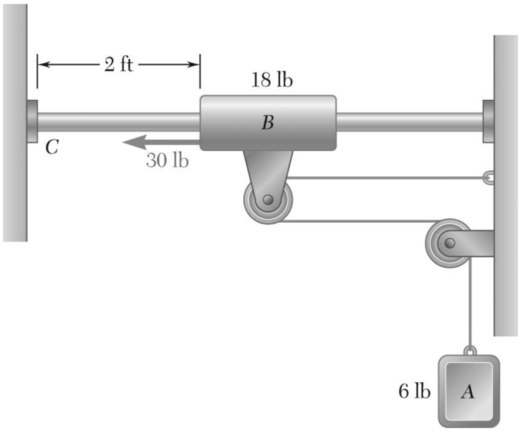
PROBLEM 13.20



The system shown is at rest when a constant 30 lb force is applied to collar B. (a) If the force acts through the entire motion, determine the speed of collar B as it strikes the support at C. (b) After what distance d should the 30 lb force be removed if the collar is to reach support C with zero velocity?

SOLUTION

Let F be the cable tension and v_B be the velocity of collar B when it strikes the support. Consider the collar B. Its movement is horizontal so only horizontal forces acting on B do work. Let d be the distance through which the 30 lb applied force moves.

$$(T_1)_B + (U_{1\to 2})_B = (T_2)_B$$

$$0 + 30d - (2F)(2) = \frac{1}{2}\frac{18}{32.2}v_B^2$$

$$30d - 4F = 0.27950 v_B^2 \qquad (1)$$

Now consider the weight A. When the collar moves 2 ft to the left, the weight moves 4 ft up, since the cable length is constant. Also, $v_A = 2v_B$.

$$(T_1)_A + (U_{1-2})_A = (T_2)_B$$

$$0 + (F - W_A)(4) = \frac{1}{2}\frac{W_A}{g}v_A^2$$

$$4F - (6)(4) = \frac{1}{2}\frac{6}{32.2}(2v_B)^2$$

$$4F - 24 = 0.37267\, v_B^2 \qquad (2)$$

Add Eqs. (1) and (2) to eliminate F.

$$30d - 24 = 0.65217 v_B^2 \qquad (3)$$

(a) Case a: $d = 2$ ft, $v_B = ?$

$$(30)(2) - (24) = 0.65217 v_B^2$$

$$v_B^2 = 55.2 \text{ ft}^2/\text{s}^2 \qquad v_B = 7.43 \text{ ft/s} \blacktriangleleft$$

(b) Case b: $d = ?$, $v_B = 0$.

$$30d - 24 = 0 \qquad d = 0.800 \text{ ft} \blacktriangleleft$$

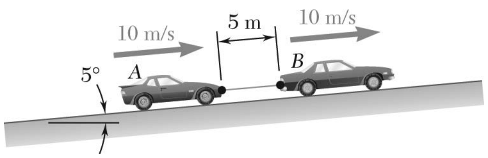
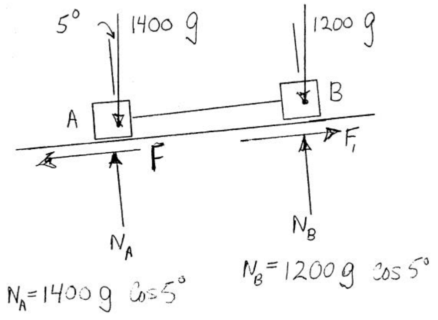
PROBLEM 13.21



Car B is towing car A at a constant speed of 10 m/s on an uphill grade when the brakes of car A are fully applied causing all four wheels to skid. The driver of car B does not change the throttle setting or change gears. The masses of the cars A and B are 1400 kg and 1200 kg, respectively, and the coefficient of kinetic friction is 0.8. Neglecting air resistance and rolling resistance, determine (*a*) the distance traveled by the cars before they come to a stop, (*b*) the tension in the cable.

SOLUTION



$F = 0.8N_A$

Given: Car B tows car A at 10 m/s uphill.

Car A brakes so 4 wheels skid. $\mu_k = 0.8$

Car B continues in same gear and throttle setting.

Find: (*a*) Distance d, traveled to stop

(*b*) Tension in cable

(*a*) F_1 = traction force (from equilibrium)

$$F_1 = (1400g)\sin 5° + (1200g)\sin 5°$$

$$= 2600(9.81)\sin 5°$$

For system: $A + B$

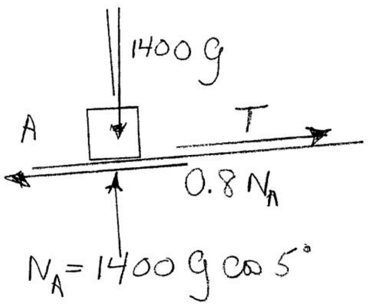
$$U_{1-2} = [(F_1 - 1400g\sin 5° - 1200g\sin 5°) - F]d$$

$$= T_2 - T_1 = 0 - \frac{1}{2}m_{A+B}v^2 = -\frac{1}{2}(2600)(10)^2$$

Since $(F_1 - 1400g\sin 5° - 1200g\sin 5°) = 0$

$$-Fd = -0.8[1400(9.81)\cos 5°]d = -130{,}000 \text{ N}\cdot\text{m}$$

$$d = 11.88 \text{ m} ◀$$



(*b*) Cable tension, T

$$U_{1-2} = [T - 0.8N_A](11.88) = T_2 - T_1$$

$$(T - 0.8(1400)(9.81)\cos 5°)11.88 = -\frac{1400}{2}(10)^2$$

$$(T - 10945) = -5892$$

$$= 5.053 \text{ kN}$$

$$T = 5.05 \text{ kN} ◀$$

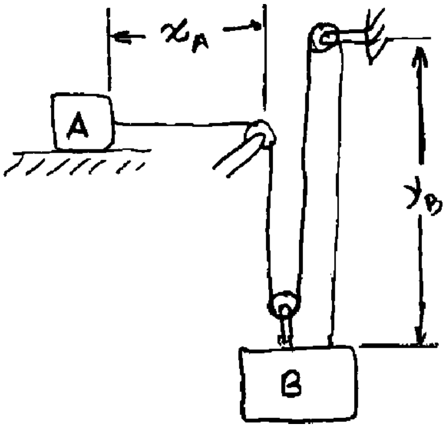
PROBLEM 13.22

The system shown is at rest when a constant 250-N force is applied to block A. Neglecting the masses of the pulleys and the effect of friction in the pulleys and between block A and the horizontal surface, determine (a) the velocity of block B after block A has moved 2 m, (b) the tension in the cable.

SOLUTION

Constraint of cable:



$$x_A + 3y_B = \text{constant}$$

$$\Delta x_A + 3\Delta y_B = 0$$

$$v_A + 3v_B = 0$$

Let F be the tension in the cable.

Block A: $m_A = 30$ kg, $P = 250$ N, $(T_1)_A = 0$

$$(T_1)_A + (U_{1\to 2})_A = (T_2)_A$$

$$0 + (P - F)(\Delta x_A) = \frac{1}{2}m_A v_A^2$$

$$0 + (250 - F)(2) = \frac{1}{2}(30)(3v_B)^2$$

$$500 - 2F = 135v_B^2 \qquad (1)$$

Block B: $m_B = 25$ kg, $W_B = m_B g = 245.25$ N

$$(T_1)_B + (U_{1\to 2})_B = (T_2)_B$$

$$0 + (3F - W_B)(-\Delta y_B) = \frac{1}{2}m_B v_B^2$$

$$(3F) - 245.25)\left(\frac{2}{3}\right) = \frac{1}{2}(25)\,v_B^2$$

$$2F - 163.5 = 12.5\,v_B^2 \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Add Eqs. (1) and (2) to eliminate F.

$$500 - 163.5 = 147.5 v_B^2$$

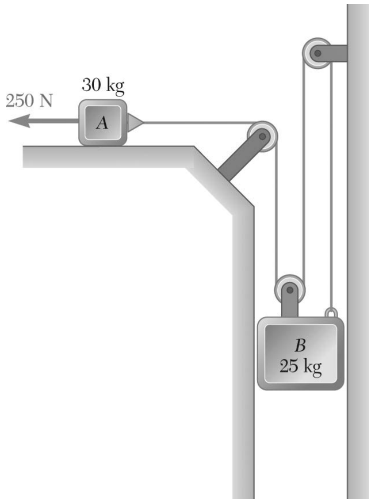
$$v_B^2 = 2.2814 \text{ m}^2/\text{s}^2$$

(*a*) Velocity of B. $\mathbf{v}_B = 1.510 \text{ m/s} \longleftarrow$ ◀

(*b*) Tension in the cable.

From Eq. (2), $2F - 163.5 = (12.5)(2.2814)$ $F = 96.0 \text{ N}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.23

The system shown is at rest when a constant 250-N force is applied to block *A*. Neglecting the masses of the pulleys and the effect of friction in the pulleys and assuming that the coefficients of friction between block *A* and the horizontal surface are $\mu_s = 0.25$ and $\mu_k = 0.20$, determine (*a*) the velocity of block *B* after block *A* has moved 2 m, (*b*) the tension in the cable.

SOLUTION

Check the equilibrium position to see if the blocks move. Let *F* be the tension in the cable.

Block *B*:

$$3F - m_B g = 0$$

$$F = \frac{m_B g}{3} = \frac{(25)(9.81)}{3} = 81.75 \text{ N}$$

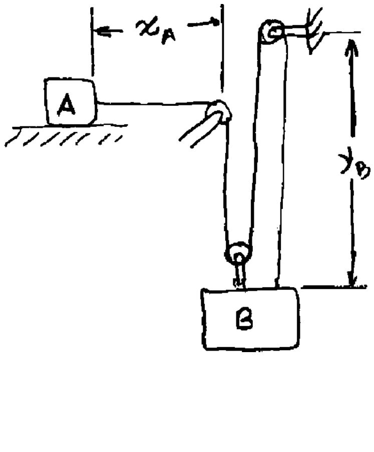
Block *A*:

$$+\uparrow \Sigma F_y = 0: \quad N_A - m_A g = 0$$

$$N_A = m_A g = (30)(9.81) = 294.3 \text{ N}$$

$$\overset{+}{\longleftarrow} \Sigma F_x = 0: \quad 250 - F_A - F = 0$$

$$F_A = 250 - 81.75 = 168.25 \text{ N}$$



Available static friction force: $\mu_s N_A = (0.25)(294.3) = 73.57$ N

Since $F_A > \mu_s N_A$, the blocks move.

The friction force, F_A, during sliding is

$$F_A = \mu_k N_A = (0.20)(294.3) = 58.86 \text{ N}$$

Constraint of cable:

$$x_A + 3y_B = \text{constant}$$

$$\Delta x_A + 3\Delta y_B = 0$$

$$v_A + 3v_B = 0$$

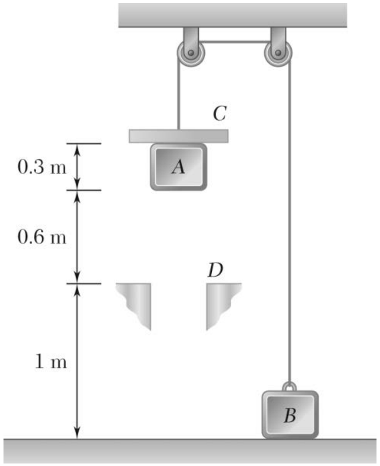
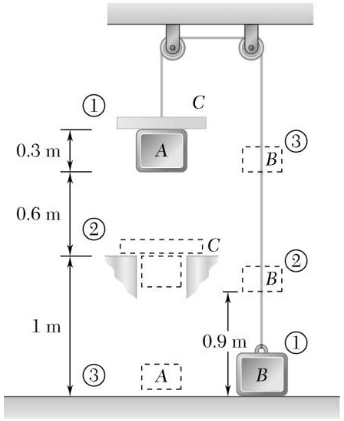
PROBLEM 13.24



Two blocks A and B, of mass 4 kg and 5 kg, respectively, are connected by a cord which passes over pulleys as shown. A 3 kg collar C is placed on block A and the system is released from rest. After the blocks have moved 0.9 m, collar C is removed and blocks A and B continue to move. Determine the speed of block A just before it strikes the ground.

SOLUTION



Position ① to Position ②. $v_1 = 0 \quad T_1 = 0$

At ② before C is removed from the system

$$T_2 = \frac{1}{2}(m_A + m_B + m_C)v_2^2 = \frac{1}{2}(12 \text{ kg})v_2^2 = 6v_2^2$$

$$U_{1-2} = (m_A + m_C - m_B)g(0.9 \text{ m})$$

$$U_{1-2} = (4+3-5)(g)(0.9 \text{ m}) = (2 \text{ kg})(9.81 \text{ m/s}^2)(0.9 \text{ m})$$

$$U_{1-2} = 17.658 \text{ J}$$

$$T_1 + U_{1-2} = T_2:$$

$$0 + 17.658 = 6v_2^2 \qquad v_2^2 = 2.943$$

At Position ②, collar C is removed from the system.

Position ② to Position ③. $T_2' = \frac{1}{2}(m_A + m_B)v_2^2 = \left(\frac{9}{2} \text{ kg}\right)(2.943) = 13.244 \text{ J}$

$$T_3 = \frac{1}{2}(m_A + m_B)(v_3)^2 = \frac{9}{2}v_3^2$$

$$U_{2'-3} = (m_A - m_B)(g)(0.7 \text{ m}) = (-1 \text{ kg})(9.81 \text{ m/s}^2)(0.7 \text{ m}) = -6.867 \text{ J}$$

$$T_2' + U_{2-3} = T_3$$

$$13.244 - 6.867 = 4.5v_3^2 \qquad v_3^2 = 1.417$$

$$v_A = v_3 = 1.190 \text{ m/s}$$

$v_A = 1.190$ m/s ◀

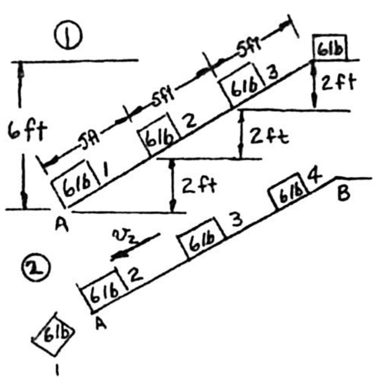
PROBLEM 13.25

Four packages, each weighing 6 lb, are held in place by friction on a conveyor which is disengaged from its drive motor. When the system is released from rest, package 1 leaves the belt at A just as package 4 comes onto the inclined portion of the belt at B. Determine (a) the speed of package 2 as it leaves the belt at A, (b) the speed of package 3 as it leaves the belt at A. Neglect the mass of the belt and rollers.

SOLUTION

Slope angle: $\sin\ \beta = \dfrac{6\ \text{ft}}{15\ \text{ft}} \qquad \beta = 23.6°$

(a) Package falls off the belt and 2, 3, 4 move down



$$\frac{6}{3} = 2\ \text{ft.}$$

$$T_2 = 3\left[\frac{1}{2}mv_2^2\right] = \frac{3}{2}\left(\frac{6\ \text{lb}}{32.2\ \text{ft/s}^2}\right)v_2^2 = 0.2795v_2^2$$

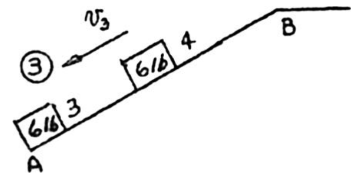
$$U_{1-2} = (3)(W)(R) = (3)(6\ \text{lb})(2\ \text{ft}) = 36\ \text{lb}\cdot\text{ft}$$

$$T_1 + U_{1-2} = T_2$$

$$0 + 36 = 0.2795v_2^2 \qquad v_2^2 = 128.8$$

$\mathbf{v}_2 = 11.35\ \text{ft/s} \swarrow 23.6°$ ◀

(b) Package 2 falls off the belt and its energy is lost to the system and 3 and 4 move down 2 ft.



$$T_2' = (2)\left[\frac{1}{2}mv_2^2\right] = \left(\frac{6\ \text{lb}}{32\ \text{ft/s}^2}\right)(128.8)$$

$$T_2' = 24\ \text{lb}\cdot\text{ft}$$

$$T_3 = (2)\left[\frac{1}{2}mv_3^2\right] = \left(\frac{6\ \text{lb}}{32.2\ \text{ft/s}^2}\right)(v_3^2) = 0.18634v_3^2$$

$$U_{2-3} = (2)(W)(2) = (2)(6\ \text{lb})(2\ \text{ft}) = 24\ \text{lb}\cdot\text{ft}$$

$$T_2 + U_{2-3} = T_3$$

$$24 + 24 = 0.18634v_3^2 \qquad v_3^2 = 257.6$$

$\mathbf{v}_3 = 16.05\ \text{ft/s} \swarrow 23.6°$ ◀

PROBLEM 13.26

A 3-kg block rests on top of a 2-kg block supported by, but not attached to, a spring of constant 40 N/m. The upper block is suddenly removed. Determine (*a*) the maximum speed reached by the 2-kg block, (*b*) the maximum height reached by the 2-kg block.

SOLUTION

Call blocks *A* and *B*. $m_A = 2 \text{ kg}, \quad m_B = 3 \text{ kg}$

(*a*) Position 1: Block *B* has just been removed.

Spring force: $F_S = -(m_A + m_B)g = -kx \uparrow$

Spring stretch: $x_1 = -\dfrac{(m_A + m_B)g}{k} = -\dfrac{(5 \text{ kg})(9.81 \text{ m/s}^2)}{40 \text{ N/m}} = -1.22625 \text{ m}$

Let position 2 be a later position while the spring still contacts block *A*.

Work of the force exerted by the spring: $(U_{1\to 2})_e = -\int_{x_1}^{x_2} kx\,dx$

$$= -\frac{1}{2}kx^2\Big|_{x_1}^{x_2} = \frac{1}{2}kx_1^2 - \frac{1}{2}kx_2^2$$

$$= \frac{1}{2}(40)(-1.22625)^2 - \frac{1}{2}(40)x_2^2 = 30.074 - 20x_2^2$$

Work of the gravitational force: $(U_{1\to 2})_g = -m_A g(x_2 - x_1)$

$$= -(2)(9.81)(x_2 + 1.22625) = -19.62x_2 - 24.059$$

Total work: $U_{1\to 2} = -20x_2^2 + 19.62x_2 + 6.015$

Kinetic energies: $T_1 = 0$

$$T_2 = \frac{1}{2}m_A v_2^2 = \frac{1}{2}(2)v_2^2 = v_2^2$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$0 + 20x_2^2 - 19.62x_2 + 6.015 = v_2^2$$

Speed squared: $v_2^2 = -20x_2^2 - 19.62x_2 + 6.015$ (1)

At maximum speed, $\dfrac{dv_2}{dx_2} = 0$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.28

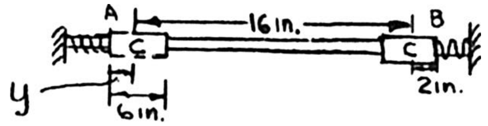
An 8-lb collar C slides on a horizontal rod between springs A and B. If the collar is pushed to the right until spring B is compressed 2 in. and released, determine the distance through which the collar will travel assuming (*a*) no friction between the collar and the rod, (*b*) a coefficient of friction $\mu_k = 0.35$.

SOLUTION

(*a*)



$$k_B = 144 \text{ lb/ft}$$
$$k_A = 216 \text{ lb/ft}$$

Since the collar C leaves the spring at B and there is no friction, it must engage the spring at A.

$$T_A = 0 \qquad T_B = 0$$

$$U_{A-B} = \int_0^{2/12} k_B x dx - \int_0^{y} k_A x dx$$

$$U_{A-B} = \left(\frac{144 \text{ lb/ft}}{2}\right)\left(\frac{2}{12}\text{ ft}\right)^2 - \left(\frac{216 \text{ lb/ft}}{2}\right)(y)^2$$

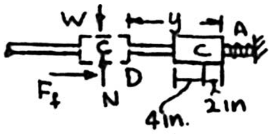
$$T_A + U_{A-B} = T_B: \qquad 0 + 2 - 108y^2 = 0$$
$$y = 0.1361 \text{ ft} = 1.633 \text{ in.}$$

Total distance $\qquad d = 2 + 16 - (6 - 1.633)$

$$d = 13.63 \text{ in.} \blacktriangleleft$$

(*b*) Assume that C does not reach the spring at B because of friction.

$$N = W = 6 \text{ lb}$$
$$F_f = (0.35)(8 \text{ lb}) = 2.80 \text{ lb}$$
$$T_A = T_D = 0$$



$$U_{A-D} = \int_0^{2/12} 144 \times dx - F_f(y) = 2 - 2.80y$$

$$T_A + U_{A-D} = T_D \quad 0 + 2 - 2.80y = 0$$
$$y = 0.714 \text{ ft} = 8.57 \text{ in.}$$

The collar must travel $16 - 6 + 2 = 12$ in. before it engages the spring at B. Since $y = 8.57$ in., it stops before engaging the spring at B.

Total distance $$d = 8.57 \text{ in.} \blacktriangleleft$$

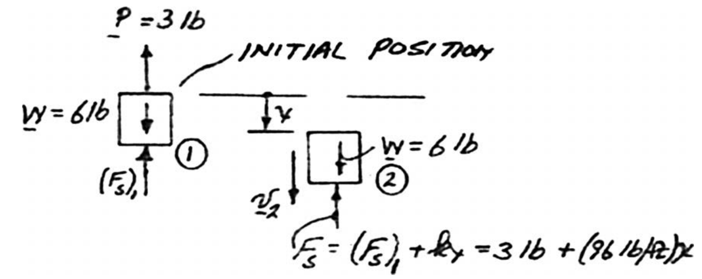
PROBLEM 13.29

A 6-lb block is attached to a cable and to a spring as shown. The constant of the spring is $k = 8$ lb/in. and the tension in the cable is 3 lb. If the cable is cut, determine (*a*) the maximum displacement of the block, (*b*) the maximum speed of the block.

SOLUTION

$$k = 8 \text{ lb/in.} = 96 \text{ lb/ft}$$



$$\Sigma F_y = 0: \quad (F_s)_1 = 6 - 3 = 3 \text{ lb } C$$

$$v_1 = 0 \quad T_1 = 0: \quad T_2 = \frac{1}{2}\left(\frac{6 \text{ lb}}{32.2}\right)v_2^2 = 0.09317 v_2^2$$

For weight: $U_{1-2} = (6 \text{ lb})x = 6x$

For spring: $U_{1-2} = -\int_0^x (3 + 96x)dx = -3x - 48x^2$

$$T_1 + U_{1-2} = T_2: \quad 0 + 6x - 3x - 48x^2 = 0.09317 v_2^2$$

$$3x - 48x^2 = 0.09317 v_2^2 \qquad (1)$$

(*a*) For x_m, $v_2 = 0$: $3x - 48x^2 = 0$

$$x = 0, \quad x_m = \frac{3}{48} = \frac{1}{16} \text{ ft}$$

$\mathbf{x}_m = 0.75$ in.↓ ◀

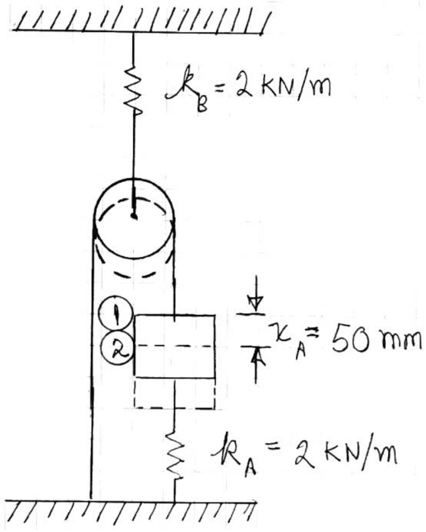
PROBLEM 13.30

A 10-kg block is attached to spring *A* and connected to spring *B* by a cord and pulley. The block is held in the position shown with both springs unstretched when the support is removed and the block is released with no initial velocity. Knowing that the constant of each spring is 2 kN/m, determine (*a*) the velocity of the block after it has moved down 50 mm, (*b*) the maximum velocity achieved by the block.

SOLUTION



(*a*) W = weight of the block $= 10\,(9.81) = 98.1$ N

$$x_B = \frac{1}{2}x_A$$

$$U_{1-2} = W(x_A) - \frac{1}{2}k_A(x_A)^2 - \frac{1}{2}k_B(x_B)^2$$

(Gravity) (Spring *A*) (Spring *B*)

$$U_{1-2} = (98.1\text{ N})(0.05\text{ m}) - \frac{1}{2}(2000\text{ N/m})(0.05\text{ m})^2$$

$$-\frac{1}{2}(2000\text{ N/m})(0.025\text{ m})^2$$

$$U_{1-2} = \frac{1}{2}(m)v^2 = \frac{1}{2}(10\text{ kg})v^2$$

$$4.905 - 2.5 - 0.625 = \frac{1}{2}(10)v^2$$

$v = 0.597$ m/s ◀

(*b*) Let x = distance moved down by the 10 kg block

$$U_{1-2} = W(x) - \frac{1}{2}k_A(x)^2 - \frac{1}{2}k_B\left(\frac{x}{2}\right)^2 = \frac{1}{2}(m)v^2$$

$$\frac{d}{dx}\left[\frac{1}{2}(m)v^2\right] = 0 = W - k_A(x) - \frac{k_B}{8}(2x)$$

PROBLEM 13.31

A 5-kg collar *A* is at rest on top of, but not attached to, a spring with stiffness k_1 = 400 N/m; when a constant 150-N force is applied to the cable. Knowing *A* has a speed of 1 m/s when the upper spring is compressed 75 mm, determine the spring stiffness k_2. Ignore friction and the mass of the pulley.

SOLUTION

Use the method of work and energy applied to the collar *A*.

$$T_1 + U_{1\to 2} = T_2$$

Since collar is initially at rest, $T_1 = 0.$

In position 2, where the upper spring is compressed 75 mm and $v_2 = 1.00$ m/s, the kinetic energy is

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(5\text{ kg})(1.00\text{ m/s})^2 = 2.5\text{ J}$$

As the collar is raised from level *A* to level *B*, the work of the weight force is

$$(U_{1\to 2})_g = -mgh$$

where $m = 5$ kg, $g = 9.81$ m/s^2 and $h = 450$ mm $= 0.450$ m

Thus, $(U_{1\to 2})_g = -(5)(9.81)(0.450) = -22.0725$ J

In position 1, the force exerted by the lower spring is equal to the weight of collar *A*.

$$F_1 = mg = -(5\text{ kg})(9.81\text{ m/s}) = -49.05\text{ N}$$

As the collar moves up a distance x_1, the spring force is

$$F = F_1 - k_1 x_2$$

until the collar separates from the spring at

$$x_f = \frac{F_1}{k_1} = \frac{49.05\text{ N}}{400\text{ N/m}} = 0.122625\text{ m} = 122.625\text{ mm}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Work of the force exerted by the lower spring:

$$(U_{1\to 2})_1 = \int_0^{x_f} (F_1 - k_1 x)dx$$

$$= F_1 x_f - \frac{1}{2}kx_f^2 = k_1 x_f^2 - \frac{1}{2}k_1 x_f^2 = \frac{1}{2}k_1 x_f^2$$

$$= \frac{1}{2}(400 \text{ N/m})(0.122625)^2 = 3.0074 \text{ J}$$

In position 2, the upper spring is compressed by $y = 75 \text{ mm} = 0.075 \text{ m}$. The work of the force exerted by this spring is

$$(U_{1\to 2})_2 = -\frac{1}{2}k_2 y^2 = -\frac{1}{2}k_2 (0.075)^2 = -0.0028125 \text{ k}_2$$

Finally, we must calculate the work of the 150 N force applied to the cable. In position 1, the length *AB* is

$$(l_{AB})_1 = \sqrt{(450)^2 + (400)^2} = 602.08 \text{ mm}$$

In position 2, the length *AB* is $(l_{AB})_2 = 400 \text{ mm}$.

The displacement *d* of the 150 N force is

$$d = (l_{AB})_1 - (l_{AB})_2 = 202.08 \text{ mm} = 0.20208 \text{ m}$$

The work of the 150 N force *P* is

$$(U_{1\to 2})_P = Pd = (150 \text{ N})(0.20208 \text{ m}) = 30.312 \text{ J}$$

Total work:

$$U_{1\to 2} = -22.0725 + 3.0074 - 0.0028125k_2 + 30.312$$

$$= 11.247 - 0.0028125k_2$$

Principle of work and energy:

$$T_1 + U_{1\to 2} = T_2$$

$$0 + 11.247 - 0.0028125k_2 = 2.5$$

$$k_2 = 3110 \text{ N/m}$$

$k_2 = 3110 \text{ N/m}$ ◀

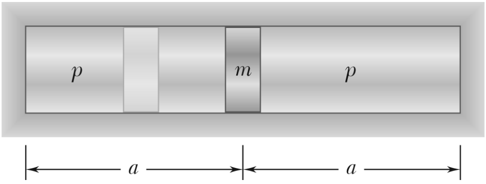
PROBLEM 13.32



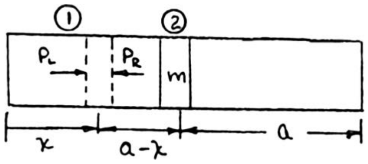
A piston of mass m and cross-sectional area A is equilibrium under the pressure p at the center of a cylinder closed at both ends. Assuming that the piston is moved to the left a distance $a/2$ and released, and knowing that the pressure on each side of the piston varies inversely with the volume, determine the velocity of the piston as it again reaches the center of the cylinder. Neglect friction between the piston and the cylinder and express your answer in terms of m, a, p, and A.

SOLUTION

Pressures vary inversely as the volume

$$\frac{p_L}{P} = \frac{Aa}{Ax} \qquad p_L = \frac{pa}{x}$$

$$\frac{p_R}{P} = \frac{Aa}{A(2a-x)} \qquad p_R = \frac{pa}{(2a-x)}$$



Initially at ①, $\quad v = 0 \quad x = \dfrac{a}{2}$

$$T_1 = 0$$

At ②, $\quad x = a, \quad T_2 = \dfrac{1}{2}mv^2$

$$U_{1-2} = \int_{a/2}^{a} (p_L - p_R)A\,dx = \int_{a/2}^{a} paA\left[\frac{1}{x} - \frac{1}{2a-x}\right]dx$$

$$U_{1-2} = paA[\ln x + \ln(2a-x)]_{a/2}^{a}$$

$$U_{1-2} = paA\left[\ln a + \ln a - \ln\left(\frac{a}{2}\right) - \ln\left(\frac{3a}{2}\right)\right]$$

$$U_{1-2} = paA\left[\ln a^2 - \ln\frac{3a^2}{4}\right] = paA\ln\left(\frac{4}{3}\right)$$

$$T_1 + U_{1-2} = T_2 \qquad 0 + paA\ln\left(\frac{4}{3}\right) = \frac{1}{2}mv^2$$

$$v^2 = \frac{2paA\ln\left(\frac{4}{3}\right)}{m} = 0.5754\frac{paA}{m} \qquad v = 0.759\sqrt{\frac{paA}{m}} \blacktriangleleft$$

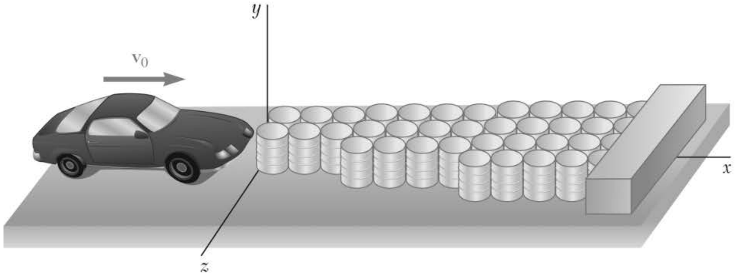
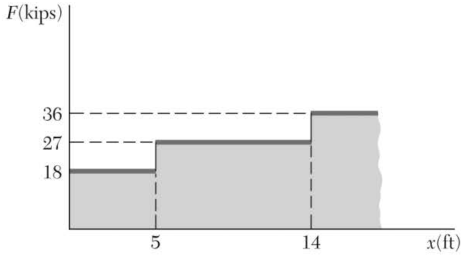
PROBLEM 13.33

An uncontrolled automobile traveling at 65 mph strikes squarely a highway crash cushion of the type shown in which the automobile is brought to rest by successively crushing steel barrels. The magnitude F of the force required to crush the barrels is shown as a function of the distance x the automobile has moved into the cushion. Knowing that the weight of the automobile is 2250 lb and neglecting the effect of friction, determine (a) the distance the automobile will move into the cushion before it comes to rest, (b) the maximum deceleration of the automobile.

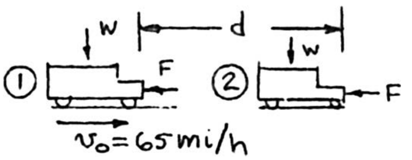




SOLUTION

(a) 65 mi/h = 95.3 ft/s

Assume auto stops in $5 \leq d \leq 14$ ft.

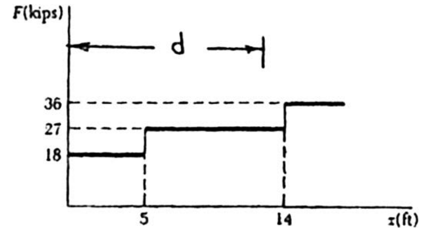


$$v_1 = 95.33 \text{ ft/s}$$

$$T_1 = \frac{1}{2}mv_1^2 \frac{1}{2}\left(\frac{2250 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(95.3 \text{ ft/s})^2$$

$$T_1 = 317{,}530 \text{ lb} \cdot \text{ft}$$

$$= 317.63 \text{ k} \cdot \text{ft}$$



$$v_2 = 0$$

$$T_2 = 0$$

$$U_{1-2} = (18 \text{ k})(5 \text{ ft}) + (27 \text{ k})(d - 5)$$

$$= 90 + 27d - 135$$

$$= 27d - 45 \text{ k} \cdot \text{ft}$$

$$T_1 + U_{1-2} = T_2$$

$$317.53 = 27d - 45$$

$d = 13.43$ ft ◀

Assumption that $d \leq 14$ ft is ok.

(b) Maximum deceleration occurs when F is largest. For $d = 13.43$ ft, $F = 27$ k. Thus, $F = ma_D$

$$(27{,}000 \text{ lb}) = \left(\frac{2250 \text{ lb}}{32.2 \text{ ft/s}^2}\right)(a_D)$$

$a_D = 386 \text{ ft/s}^2$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.34

Two types of energy-absorbing fenders designed to be used on a pier are statically loaded. The force-deflection curve for each type of fender is given in the graph. Determine the maximum deflection of each fender when a 90-ton ship moving at 1 mi/h strikes the fender and is brought to rest.

SOLUTION

Weight: $W_1 = (90 \text{ ton})(2000 \text{ lb/ton}) = 180\times 10^3 \text{ lb}$

Mass: $m = \dfrac{W}{g} = \dfrac{180\times 10^3}{32.2} = 5590 \text{ lb}\cdot\text{s}^2/\text{ft}$

Speed: $v_1 = 1 \text{ mi/h} = \dfrac{5280 \text{ ft}}{3600 \text{ s}} = 1.4667 \text{ ft/s}$

Kinetic energy: $T_1 = \dfrac{1}{2}mv_1^2 = \dfrac{1}{2}(5590)(1.4667)^2$

$= 6012 \text{ ft}\cdot\text{lb}$

$T_2 = 0 \quad \text{(rest)}$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$6012 + U_{1\to 2} = 0$

$U_{1\to 2} = -6012 \text{ ft}\cdot\text{lb} = -72.15 \text{ kip}\cdot\text{in.}$

The area under the force-deflection curve up to the maximum deflection is equal to $72.15 \text{ kip}\cdot\text{in.}$

Fender *A*: From the force-deflection curve $F = kx$ $\quad k = \dfrac{F_{max}}{x_{max}} = \dfrac{60}{12} = 5 \text{ kip/in.}$

$$\text{Area} = \int_0^x f dx = \int_0^x kx\, dx = \frac{1}{2}kx^2$$

$\dfrac{1}{2}(5)x^2 = 72.51$

$x^2 = 28.86 \text{ in.}^2 \qquad\qquad x = 5.37 \text{ in.}$ ◀

Fender *B*: We divide area under curve *B* into trapezoids

		Partial area	Total Area
From $x = 0$	to $x = 2$ in.:	$\dfrac{1}{2}(2 \text{ in.})(4 \text{ kips}) = 4 \text{ kip}\cdot\text{in.}$	$4 \text{ kip}\cdot\text{in.}$
From $x = 2$ in.	to $x = 4$ in.:	$\dfrac{1}{2}(2 \text{ in.})(4+10) = 14 \text{ kip}\cdot\text{in.}$	$18 \text{ kip}\cdot\text{in.}$
From $x = 4$ in.	to $x = 6$ in.:	$\dfrac{1}{2}(2 \text{ in.})(10+18) = 28 \text{ kip}\cdot\text{in.}$	$46 \text{ kip}\cdot\text{in.}$

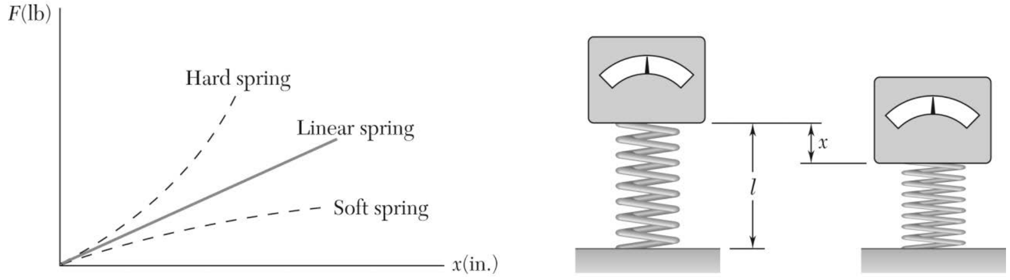
PROBLEM 13.35

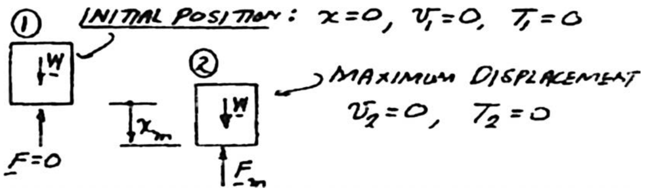
Nonlinear springs are classified as hard or soft, depending upon the curvature of their force-deflection curve (see figure). If a delicate instrument having a mass of 5 kg is placed on a spring of length l so that its base is just touching the undeformed spring and then inadvertently released from that position, determine the maximum deflection x_m of the spring and the maximum force F_m exerted by the spring, assuming (*a*) a linear spring of constant $k = 3$ kN/m, (*b*) a hard, nonlinear spring, for which $F = (3 \text{ kN/m})(x + 160x^2)$.



SOLUTION

$W = mg = (5 \text{ kg})g$

$W = 49.05$ N



Since $T_1 = T_2 = 0, \quad T_1 + U_{1-2} = T_2$ yields $U_{1-2} = 0$

$$U_{1-2} = Wx_m - \int_0^{x_m} F dx = 49.05x_m - \int_0^{x_m} F dx = 0 \tag{1}$$

(*a*) For $F = kx = (300 \text{ N/m})x$

Eq. (1): $$49.05x_m - \int_0^{x_m} 3000x\, dx = 0$$

$$49.05x_m - 1500x_m^2 = 0 \qquad x_m = 32.7 \times 10^{-3} \text{ m} = 32.7 \text{ mm} \blacktriangleleft$$

$$F_m = 3000x_m = 3000(32.7 \times 10^{-3}) \qquad \mathbf{F}_m = 98.1 \text{ N} \uparrow \blacktriangleleft$$

(*b*) For $$F = (3000 \text{ N/m})x(1 + 160x^2)$$

Eq. (1) $$49.05x_m - \int_0^{x_m} 3000(x + 160x^3)dx = 0$$

$$49.05x_m - 3000\left(\frac{1}{2}x_m^2 + 40x_m^4\right) = 0 \tag{2}$$

Solve by trial: $x_m = 30.44 \times 10^{-3}$ m $\qquad x_m = 30.4 \text{ mm} \blacktriangleleft$

$$F_m = (3000)(30.44 \times 10^{-3})[1 + 160(30.44 \times 10^{-3})^2] \qquad \mathbf{F}_m = 104.9 \text{ N} \uparrow \blacktriangleleft$$

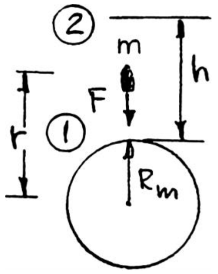
PROBLEM 13.36

A rocket is fired vertically from the surface of the moon with a speed v_0. Derive a formula for the ratio h_n/h_u of heights reached with a speed v, if Newton's law of gravitation is used to calculate h_n and a uniform gravitational field is used to calculate h_u. Express your answer in terms of the acceleration of gravity g_m on the surface of the moon, the radius R_m of the moon, and the speeds v and v_0.

SOLUTION

Newton's law of gravitation



$$T_1 = \frac{1}{2}mv_0^2 \qquad T_2 = \frac{1}{2}mv^2$$

$$U_{1-2} = \int_{R_m}^{R_m+h_n} (-F_n)dr \qquad F_n = \frac{mg_mR_m^2}{r^2}$$

$$U_{1-2} = -mg_mR_m^2\int_{R_m}^{R_m+h_n} \frac{dr}{r^2}$$

$$U_{1-2} = mg_mR_m^2\left(\frac{1}{R_m} - \frac{1}{R_m+h_n}\right)$$

$$T_1 + U_{1-2} = T_2$$

$$\frac{1}{2}mv_0^2 + mg_m\left(R_m - \frac{R_m}{R_m+h_n}\right) = \frac{1}{2}mv^2$$

$$h_n = \frac{\left(v_0^2 - v^2\right)}{2g_m}\left[\frac{R_m}{R_m - \frac{\left(v_0^2-v^2\right)}{2_{gm}}}\right] \qquad (1)$$

Uniform gravitational field

$$T_1 = \frac{1}{2}mv_0^2 \quad T_2 = mv^2$$

$$U_{1-2} = \int_{R_m}^{R_m+h_n} (-F_u)dr = -mg_m(R_m + h_u - R_m) = -mgh_u$$

$$T_1 + U_{1-2} = T_2 \quad \frac{1}{2}mv_0^2 - mg_mh_u = \frac{1}{2}mv^2$$

$$h_u = \frac{\left(v_0^2 - v^2\right)}{2g_m} \qquad (2)$$

Dividing (1) *by* (2)

$$\frac{h_n}{h_u} = \frac{1}{1 - \frac{\left(v_0^2-v^2\right)}{(2g_mR_m)}} \blacktriangleleft$$

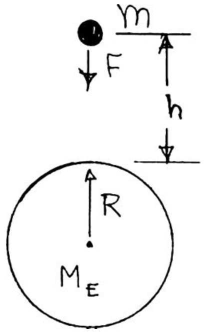
PROBLEM 13.37

Express the acceleration of gravity g_h at an altitude h above the surface of the earth in terms of the acceleration of gravity g_0 at the surface of the earth, the altitude h and the radius R of the earth. Determine the percent error if the weight that an object has on the surface of earth is used as its weight at an altitude of (*a*) 1 km, (*b*) 1000 km.

SOLUTION

$$F = \frac{GM_E m}{(h+R)^2} = \frac{GM_E m/R^2}{\left(\frac{h}{R}+1\right)^2} mg_h$$



At earth's surface, ($h = 0$) $\quad \dfrac{GM_E m}{R^2} = mg_0$

$$\frac{GM_E}{R^2} = g_0 \quad g_h = \frac{\frac{GM_E}{R^2}}{\left(\frac{h}{R}+1\right)^2}$$

Thus, $\quad g_h = \dfrac{g_0}{\left(\frac{h}{R}+1\right)^2}$

$$R = 6370 \text{ km}$$

At altitude h, "true" weight $\quad F = mg_h = W_T$

Assumed weight $\quad W_0 = mg_0$

$$\text{Error} = E = \frac{W_0 - W_T}{W_0} = \frac{mg_0 - mg_h}{mg_0} = \frac{g_0 - g_h}{g_0}$$

$$g_h = \frac{g_0}{\left(\frac{h}{R}+1\right)^2} \quad E = \frac{g_0 - \frac{g_0}{\left(1+\frac{h}{R}\right)^2}}{g_0} = \left[1 - \frac{1}{\left(1+\frac{h}{R}\right)^2}\right]$$

(*a*) $h = 1$ km: $\quad P = 100E = 100\left[1 - \dfrac{1}{\left(1+\frac{1}{6370}\right)^2}\right]$ $\quad P = 0.0314\%$ ◀

(*b*) $h = 1000$ km: $\quad P = 100E = 100\left[1 - \dfrac{1}{\left(1+\frac{1000}{6370}\right)^2}\right]$ $\quad P = 25.3\%$ ◀

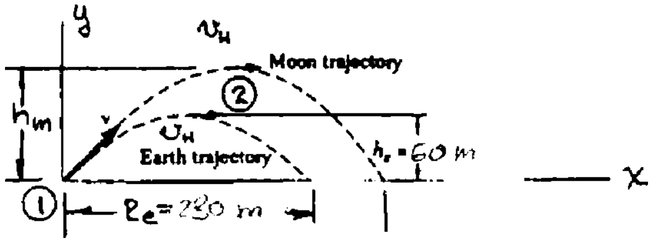
PROBLEM 13.38

A golf ball struck on earth rises to a maximum height of 60 m and hits the ground 230 m away. How high will the same golf ball travel on the moon if the magnitude and direction of its velocity are the same as they were on earth immediately after the ball was hit? Assume that the ball is hit and lands at the same elevation in both cases and that the effect of the atmosphere on the earth is neglected, so that the trajectory in both cases is a parabola. The acceleration of gravity on the moon is 0.165 times that on earth.

SOLUTION



Solve for h_m.

At maximum height, the total velocity is the horizontal component of the velocity, which is constant and the same in both cases.

$$T_1 = \frac{1}{2}mv^2 \qquad T_2 = \frac{1}{2}mv_H^2$$

$$U_{1-2} = -mg_e h_e \quad \text{Earth}$$

$$U_{1-2} = -mg_m h_m \quad \text{Moon}$$

Earth $$\frac{1}{2}mv^2 - mg_e h_e = \frac{1}{2}mv_H^2$$

Moon $$\frac{1}{2}mv^2 - mg_m h_m = \frac{1}{2}mv_H^2$$

$$-g_e h_e + g_m h_m = 0 \qquad \frac{h_m}{h_e} = \frac{g_e}{g_m}$$

Subtracting $$h_m = (60\text{ m})\left(\frac{g_e}{0.165 g_e}\right)$$ $h_m = 364$ m ◀

PROBLEM 13.39

The sphere at A is given a downward velocity $\mathbf{v}_0$ of magnitude 5 m/s and swings in a vertical plane at the end of a rope of length $l = 2$ m attached to a support at O. Determine the angle θ at which the rope will break, knowing that it can withstand a maximum tension equal to twice the weight of the sphere.

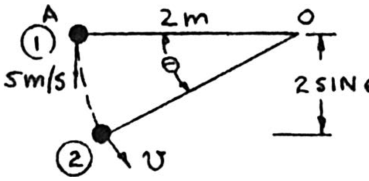
SOLUTION

$$T_1 = \frac{1}{2}mv_0^2 = \frac{1}{2}m\,(5)^2$$

$$T_1 = 12.5 \text{ m}$$

$$T_2 = \frac{1}{2}mv^2$$

$$U_{1-2} = mg(l)\sin\theta$$

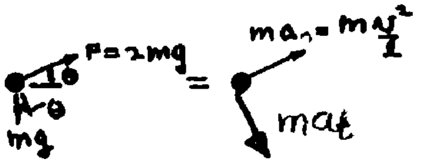


$$T_1 + U_{1-2} = T_2 \qquad 12.5m + 2mg\sin\theta = \frac{1}{2}mv^2$$

$$25 + 4g\sin\theta = v^2 \tag{1}$$

Newton's law at ②.

$$+\nearrow \; 2mg - mg\sin\theta = m\frac{v^2}{\ell} = m\frac{v^2}{2} \tag{2}$$



$$v^2 = 4g - 2g\sin\theta$$

Substitute for v^2 from Eq. (2) into Eq. (1)

$$25 + 4g\sin\theta = 4g - 2g\sin\theta$$

$$\sin\theta = \frac{(4)(9.81) - 25}{(6)(9.81)} = 0.2419$$

$\theta = 14.00°$ ◀

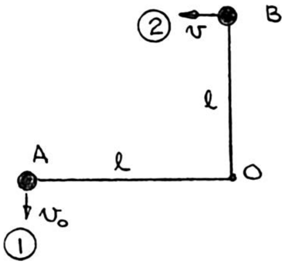
PROBLEM 13.40

The sphere at A is given a downward velocity $\mathbf{v}_0$ and swings in a vertical circle of radius l and center O. Determine the smallest velocity $\mathbf{v}_0$ for which the sphere will reach Point B as it swings about Point O (*a*) if AO is a rope, (*b*) if AO is a slender rod of negligible mass.

SOLUTION



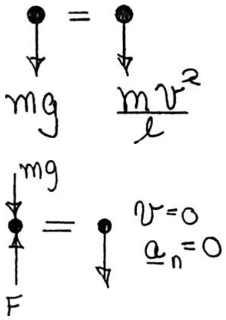
$$T_1 = \frac{1}{2}mv_0^2$$

$$T_2 = \frac{1}{2}mv^2$$

$$U_{1-2} = -mgl$$

$$T_1 + U_{1-2} = T_2 \qquad \frac{1}{2}mv_0^2 - mgl = \frac{1}{2}mv^2$$

$$v_0^2 = v^2 + 2gl$$



Newton's law at ②

(*a*) For minimum v, tension in the cord must be zero.

Thus, $v^2 = gl$

$$v_0^2 = v^2 + 2gl = 3gl \qquad v_0 = \sqrt{3gl} \blacktriangleleft$$

(*b*) Force in the rod can support the weight so that v can be zero.

Thus, $v_0^2 = 0 + 2gl \qquad v_0 = \sqrt{2gl} \blacktriangleleft$

PROBLEM 13.47

It takes 15 s to raise a 1200-kg car and the supporting 300-kg hydraulic car-lift platform to a height of 2.8 m. Determine (*a*) the average output power delivered by the hydraulic pump to lift the system, (*b*) the average power electric required, knowing that the overall conversion efficiency from electric to mechanical power for the system is 82 percent.

SOLUTION

(*a*)

$$(P_P)_A = (F)(v_A) = (m_C + m_L)(g)(v_A)$$

$$v_A = \text{s/t} = (2.8\text{ m})/(15\text{ s}) = 0.18667\text{ m/s}$$

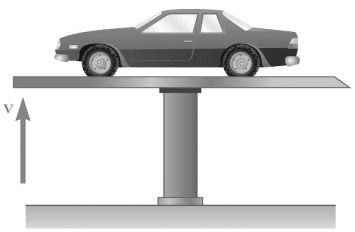
$$(P_P)_A = [(1200\text{ kg}) + (300\text{ kg})](9.81\text{ m/s}^2)(0.18667\text{ m/s})^3$$

$$(P_P)_A = 2.747\text{ kJ/s} \qquad (P_P)_A = 2.75\text{ kW} \blacktriangleleft$$

(*b*)

$$(P_E)_A = (P_P)/\eta = (2.75\text{ kW})/(0.82) \qquad (P_E)_A = 3.35\text{ kW} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



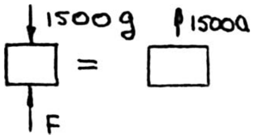
PROBLEM 13.48

The velocity of the lift of Problem 13.47 increases uniformly from zero to its maximum value at mid-height 7.5 s and then decreases uniformly to zero in 7.5 s. Knowing that the peak power output of the hydraulic pump is 6 kW when the velocity is maximum, determine the maximum life force provided by the pump.

PROBLEM 13.47 It takes 15 s to raise a 1200-kg car and the supporting 300-kg hydraulic car-lift platform to a height of 2.8 m. Determine (*a*) the average output power delivered by the hydraulic pump to lift the system, (*b*) the average power electric required, knowing that the overall conversion efficiency from electric to mechanical power for the system is 82 percent.

SOLUTION

Newton's law



$$Mg = (M_C + M_L)g = (1200 + 300)g$$

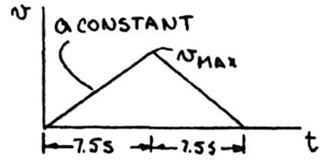
$$Mg = 1500g$$

$$+\uparrow \quad \Sigma F = F - 1500g = 1500a \qquad (1)$$

Since motion is uniformly accelerated, a = constant

Thus, from (1), F is constant and peak power occurs when the velocity is a maximum at 7.5 s.

$$a = \frac{v_{\text{max}}}{7.5 \text{ s}}$$



$$P = (6000 \text{ W}) = (F)(v_{\text{max}})$$

$$v_{\text{max}} = (6000)/F$$

Thus,

$$a = (6000)/(7.5)(F) \qquad (2)$$

Substitute (2) into (1)

$$F - 1500g = (1500)(6000)/(7.5)(F)$$

$$F^2 - (1500 \text{ kg})(9.81 \text{ m/s}^2)F - \frac{(1500 \text{ kg})(6000 \text{ N}\cdot\text{m/s})}{(7.5 \text{ s})} = 0$$

$$F^2 - 14{,}715F - 1.2\times10^6 = 0$$

$$F = 14{,}800 \text{ N}$$

$$F = 14.8 \text{ kN} \blacktriangleleft$$

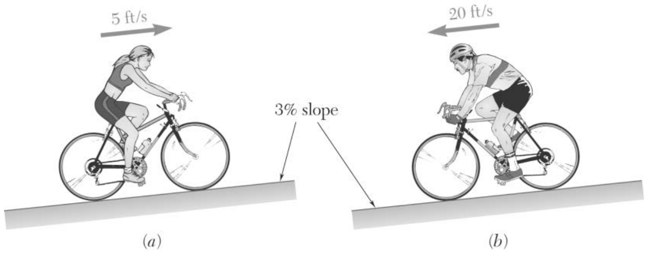
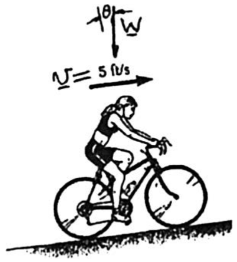
PROBLEM 13.49

(*a*) A 120-lb woman rides a 15-lb bicycle up a 3-percent slope at a constant speed of 5 ft/s. How much power must be developed by the woman? (*b*) A 180-lb man on an 18-lb bicycle starts down the same slope and maintains a constant speed of 20 ft/s by braking. How much power is dissipated by the brakes? Ignore air resistance and rolling resistance.



SOLUTION

$$\tan\theta = \frac{3}{100} \qquad \theta = 1.718^\circ$$



(*a*)

$$W = W_B + W_W = 15 + 120$$

$$W = 135 \text{ lb}$$

$$P_W = \mathbf{W}\cdot\mathbf{v} = (W\sin\theta)(v)$$

$$P_W = (135)(\sin 1.718^\circ)(5)$$

$$P_W = 20.24 \text{ ft}\cdot\text{lb/s}$$

(*a*)

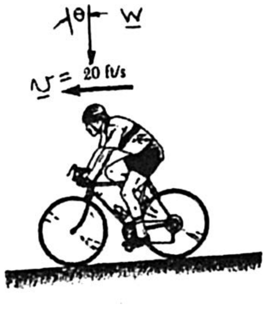
$$P_W = 20.2 \text{ ft}\cdot\text{lb/s} \blacktriangleleft$$

(*b*)

$$W = W_B + W_m = 18 + 180$$

$$W = 198 \text{ lb}$$

Brakes must dissipate the power generated by the bike and the man going down the slope at 20 ft/s.



(*b*)

$$P_B = \mathbf{W}\cdot\mathbf{v} = (W\sin\theta)(v)$$

$$P_B = (198)(\sin 1.718)(20)$$

$$P_B = 118.7 \text{ ft}\cdot\text{lb/s} \blacktriangleleft$$

PROBLEM 13.50

A power specification formula is to be derived for electric motors which drive conveyor belts moving solid material at different rates to different heights and distances. Denoting the efficiency of the motors by η and neglecting the power needed to drive the belt itself, derive a formula (*a*) in the SI system of units for the power *P* in kW, in terms of the mass flow rate *m* in kg/h, the height *b* and horizontal distance *l* in meters, and (*b*) in U.S. customary units, for the power in hp, in terms of the material flow rate *w* in tons/h, and the height *b* and horizontal distance *l* in feet.

SOLUTION

(*a*) Material is lifted to a height *b* at a rate, $(m\text{ kg/h})(g\text{ m/s}^2) = [mg(\text{N/h})]$

Thus,

$$\frac{\Delta U}{\Delta t} = \frac{[mg(\text{N/h})][b(m)]}{(3600\text{ s/h})} = \left(\frac{mgb}{3600}\right)\text{N}\cdot\text{m/s}$$

$$1000\text{ N}\cdot\text{m/s} = 1\text{ kW}$$

Thus, including motor efficiency, η

$$P(\text{kw}) = \frac{mgb(\text{N}\cdot\text{m/s})}{(3600)\left(\dfrac{1000\text{ N}\cdot\text{m/s}}{\text{kW}}\right)(\eta)}$$

$$P(\text{kW}) = 0.278\times10^{-6}\frac{mgb}{\eta} \blacktriangleleft$$

(*b*)

$$\frac{\Delta U}{\Delta t} = \frac{[W(\text{tons/h})(2000\text{ lb/ton})][b(\text{ft})]}{3600\text{ s/h}}$$

$$= \frac{Wb}{1.8}\text{ ft}\cdot\text{lb/s}; \quad 1\text{hp} = 550\text{ ft}\cdot\text{lb/s}$$

With η,

$$hp = \left[\frac{Wb}{1.8}(\text{ft}\cdot\text{lb/s})\right]\left[\frac{1\text{ hp}}{550\text{ ft}\cdot\text{lb/s}}\right]\left[\frac{1}{\eta}\right]$$

$$hp = \frac{1.010\times10^{-3}Wb}{\eta} \blacktriangleleft$$

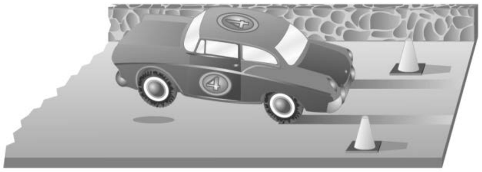
PROBLEM 13.51



In an automobile drag race, the rear (drive) wheels of a 1000 kg car skid for the first 20 m and roll with sliding impending during the remaining 380 m. The front wheels of the car are just off the ground for the first 20 m, and for the remainder of the race 80 percent of the weight is on the rear wheels. Knowing that the coefficients of friction are $\mu_s = 0.90$ and $\mu_k = 0.68$, determine the power developed by the car at the drive wheels (*a*) at the end of the 20-m portion of the race, (*b*) at the end of the race: Give your answer in kW and in hp. Ignore the effect of air resistance and rolling friction.

SOLUTION

(*a*) First 20 m. (Calculate velocity at 20 m.) Force generated by rear wheels $= \mu_k W$, since car skids.

Thus,
$$F_s = (0.68)(1000)(g)$$
$$F_s = (0.68)(1000 \text{ kg})(9.81 \text{ m/s}^2) = 6670.8 \text{ N}$$

Work and energy.
$$T_1 = 0, \quad T_2 = \frac{1}{2}mv_{20}^2 = 500v_{20}^2$$
$$T_1 + U_{1-2} = T_2$$
$$U_{1-2} = (20 \text{ m})(F_s) = (20 \text{ m})(6670.8 \text{ N})$$
$$U_{1-2} = 133{,}420 \text{ J}$$
$$0 + 133{,}420 = 500v_{20}^2$$
$$v_{20}^2 = \frac{133{,}420}{500} = 266.83$$
$$v_{20} = 16.335 \text{ m/s}$$
$$\text{Power} = (F_s)(v_{20}) = (6670.8 \text{ N})(16.335 \text{ m/s})$$
$$\text{Power} = 108{,}970 \text{ J/s} = 108.97 \text{ kJ/s}$$
$$1 \text{ kJ/s} = 1 \text{ kW}$$
$$1 \text{ hp} = 0.7457 \text{ kW} \qquad \text{Power} = 109.0 \text{ kJ/s} = 109.0 \text{ kW} \blacktriangleleft$$
$$\text{Power} = \frac{(109.0 \text{ kW})}{(0.7457 \text{ kW/hp})} = 146.2 \text{ hp} \blacktriangleleft$$

PROBLEM 13.52

The frictional resistance of a ship is known to vary directly as the 1.75 power of the speed v of the ship. A single tugboat at full power can tow the ship at a constant speed of 4.5 km/h by exerting a constant force of 300 kN. Determine (*a*) the power developed by the tugboat, (*b*) the maximum speed at which two tugboats, capable of delivering the same power, can tow the ship.

SOLUTION

(*a*) Power developed by tugboat at 4.5 km/h.

$$v_0 = 4.5 \text{ km/h} = 1.25 \text{ m/s}$$
$$F_0 = 300 \text{ kN}$$

$$P_0 = F_0 v_0 = (300 \text{ kN})(1.25 \text{ m/s}) \qquad P_0 = 375 \text{ kW} \blacktriangleleft$$

(*b*) Maximum speed.

Power required to tow ship at speed v:

$$F = F_0\left(\frac{v}{v_0}\right)^{1.75} \qquad P = Fv = F_0 v\left(\frac{v}{v_0}\right)^{1.75} = F_0 v_0\left(\frac{v}{v_0}\right)^{2.75} \qquad (1)$$

Since we have two tugboats, the available power is twice maximum power $F_0 v_0$ developed by one tugboat.

$$2F_0 v_0 = F_0 v_0\left(\frac{v}{v_0}\right)^{2.75}$$

$$\left(\frac{v}{v_0}\right)^{2.75} = 2 \qquad v = v_0(2)^{1/2.75} = v_0(1.2867)$$

Recalling that $v_0 = 4.5$ km/h

$$v = (4.5 \text{ km/h})(1.2867) = 5.7902 \text{ km/h} \qquad v = 5.79 \text{ km/h} \blacktriangleleft$$

PROBLEM 13.53

A train of total mass equal to 500 Mg starts from rest and accelerates uniformly to a speed of 90 km/h in 50 s. After reaching this speed, the train travels with a constant velocity. The track is horizontal and axle friction and rolling resistance result in a total force of 15 kN in a direction opposite to the direction of motion. Determine the power required as a function of time.

SOLUTION

Let F_P be the driving force and F_R be the resisting force due to axle friction and rolling resistance.

Uniformly accelerated motion. ($t < 50$ s):

$$v = v_0 + at \qquad v_0 = 0$$

At $t = 50s, \qquad v = 90 \text{ km/h} = 25 \text{ m/s}$

$$25 \text{ m/s} = 0 + a(50)$$

$$a = 0.5 \text{ m/s}^2$$

$$v = (0.5 \text{ m/s}^2)t$$

Newton's second law: $F_P - F_R = ma$

where $F_R = 15 \text{ kN} = 15\times10^3 \text{ N}$

$$m = 500 \text{ Mg} = 500\times10^3 \text{ kg}$$

$$a = 0.5 \text{ m/s}^2$$

$$F_P = F_R + ma = 15\times10^3 + (500\times10^3)(0.5)$$

$$= 265\times10^3 \text{ N} = 265 \text{ kN}$$

Power: $F_P v = (265\times10^3)(0.5t)$

$(0 < 50\text{s})$ Power = (132.5 kW/s)t ◀

Uniform motion. ($t > 50$ s): $a = 0$

$$F_P = F_R = 15\times10^3 \text{ N}; \; v = 25 \text{ m/s}$$

Power: $F_P v = (15\times10^3)(25 \text{ m/s}) = 375\times10^3 W$

$(t > 50 \text{ s})$ Power = 375 kW ◀

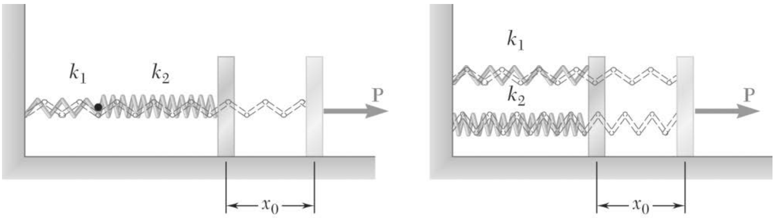
PROBLEM 13.55

A force **P** is slowly applied to a plate that is attached to two springs and causes a deflection x_0. In each of the two cases shown, derive an expression for the constant k_e, in terms of k_1 and k_2, of the single spring equivalent to the given system, that is, of the single spring which will undergo the same deflection x_0 when subjected to the same force **P**.



(*a*) (*b*)

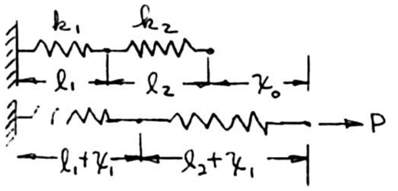
SOLUTION

System is in equilibrium in deflected x_0 position.

Case (*a*) Force in both springs is the same = P

$$x_0 = x_1 + x_2$$

$$x_0 = \frac{P}{k_e}$$



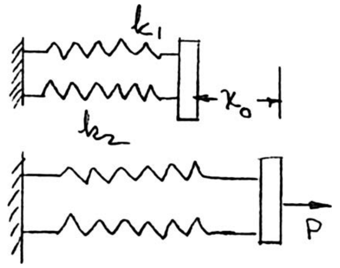
$$x_1 = \frac{P}{k_1} \qquad x_2 = \frac{P}{k_2}$$

Thus,

$$\frac{P}{k_e} = \frac{P}{k_1} + \frac{P}{k_2}$$

$$\frac{1}{k_e} = \frac{1}{k_1} + \frac{1}{k_2}$$

$$k_e = \frac{k_1 k_2}{k_1 + k_2} \blacktriangleleft$$



Case (*b*) Deflection in both springs is the same = x_0

$$P = k_1 x_0 + k_2 x_0$$

$$P = (k_1 + k_2) x_0$$

$$P = k_e x_0$$

Equating the two expressions for

$$P = (k_1 + k_2) x_0 = k_e x_0$$

$$k_e = k_1 + k_2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.56

A loaded railroad car of mass m is rolling at a constant velocity $\mathbf{v_0}$ when it couples with a massless bumper system. Determine the maximum deflection of the bumper assuming the two springs are (*a*) in series (as shown), (*b*) in parallel.

SOLUTION

Let position A be at the beginning of contact and position B be at maximum deflection.

$$T_A = \frac{1}{2}mv_0^2$$

$$V_A = 0 \qquad \text{(zero force in springs)}$$

$$T_B = 0 \qquad (v = 0 \text{ at maximum deflection})$$

$$V_B = \frac{1}{2}k_1x_1^2 + \frac{1}{2}k_2x_2^2$$

where x_1 is deflection of spring k_1 and x_2 is that of spring k_2.

Conservation of energy: $T_A + V_A = T_B + V_B$

$$\frac{1}{2}mv_0^2 + 0 = 0 + \frac{1}{2}k_1x_1^2 + \frac{1}{2}k_2x_2^2$$

$$k_1x_1^2 + k_2x_2^2 = mv_0^2 \qquad (1)$$

(*a*) *Springs are in series.*

Let F be the force carried by the two springs.

Then, $x_1 = \dfrac{F}{k_1}$ and $x_2 = \dfrac{F}{k_2}$

Eq. (1) becomes $F^2\left(\dfrac{1}{k_1} + \dfrac{1}{k_2}\right) = mv_0^2$

so that $F = v_0\sqrt{m\Big/\left(\dfrac{1}{k_1} + \dfrac{1}{k_2}\right)}$

The maximum deflection is $\delta = x_1 + x_2 = \left(\dfrac{1}{k_1} + \dfrac{1}{k_2}\right)F$

$$= \left(\frac{1}{k_1} + \frac{1}{k_2}\right)v_0\sqrt{m\Big/\left(\frac{1}{k_1} + \frac{1}{k_2}\right)}$$

$$= v_0\sqrt{m\left(\frac{1}{k_1} + \frac{1}{k_2}\right)} \qquad \delta = v_0\sqrt{m(k_1 + k_2)/k_1k_2} \blacktriangleleft$$

PROBLEM 13.57

A 600-g collar C may slide along a horizontal, semicircular rod ABD. The spring CE has an undeformed length of 250 mm and a spring constant of 135 N/m. Knowing that the collar is released from rest at A and neglecting friction, determine the speed of the collar (*a*) at B, (*b*) at D.

SOLUTION

First calculate the lengths of the spring when the collar is at positions A, B, and D.

$$l_A = \sqrt{440^2 + 300^2 + 180^2} = 562.14 \text{ mm}$$

$$l_B = \sqrt{240^2 + 300^2 + 20^2} = 384.71 \text{ mm}$$

$$l_D = \sqrt{40^2 + 300^2 + 180^2} = 352.14 \text{ mm}$$

The elongations of springs are given by $e = l - l_0$.

$$e_A = 562.14 - 250 = 312.14 \text{ mm} = 0.31214 \text{ m}$$

$$e_B = 384.71 - 250 = 134.71 \text{ mm} = 0.13471 \text{ m}$$

$$e_D = 352.14 - 250 = 102.14 \text{ mm} = 0.10214 \text{ m}$$

Potential energies: $V = \frac{1}{2}ke^2$

$$V_A = \frac{1}{2}(135 \text{ N/m})(0.31214 \text{ m})^2 = 6.5767 \text{ J}$$

$$V_B = \frac{1}{2}(135 \text{ N/m})(0.13471 \text{ m})^2 = 1.2249 \text{ J}$$

$$V_D = \frac{1}{2}(135 \text{ N/m})(0.10214 \text{ m})^2 = 0.7042 \text{ J}$$

Since the semicircular rod ABC is horizontal, there is no change in gravitational potential energy.

Mass of collar: $m = 600 \text{ g} = 0.600 \text{ kg}$

Kinetic energies:

$$T_A = \frac{1}{2}mv_A^2 = 0.300\,v_A^2 = 0$$

$$T_B = \frac{1}{2}mv_B^2 = 0.300\,v_B^2$$

$$T_D = \frac{1}{2}mv_D^2 = 0.300\,v_D^2$$

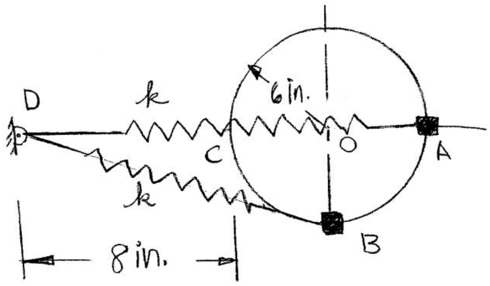
PROBLEM 13.58

A 3-lb collar is attached to a spring and slides without friction along a circular rod in a *horizontal* plane. The spring has an undeformed length of 7 in. and a constant $k = 1.5$ lb/in. Knowing that the collar is in equilibrium at A and is given a slight push to get it moving, determine the velocity of the collar (a) as it passes through B, (b) as it passes through C.

SOLUTION



$$L_0 = 7 \text{ in.}, L_{DA} = 20 \text{ in.}$$

$$L_{DB} = \sqrt{(8+6)^2 + 6^2} = 15.23 \text{ in.}$$

$$L_{DC} = 8 \text{ in.}$$

$$\Delta L_{DA} = 20 - 7 = 13 \text{ in.}$$

$$\Delta L_{DB} = 15.23 - 7 = 8.23 \text{ in.}$$

$$\Delta L_{DC} = 8 - 7 = 1 \text{ in.}$$

(a)

$$T_A = 0, \; V_A = \frac{1}{2}k(\Delta L_{DA})^2 = \frac{1}{2}(1.5)(13)^2 = 126.75 \text{ lb}\cdot\text{in.}$$

$$= 10.5625 \text{ lb}\cdot\text{ft}$$

$$T_B = \frac{1}{2}mv_B^2 = \frac{1.5}{g}\,v_B^2$$

$$V_B = \frac{1}{2}(1.5)(8.23)^2 = 50.8 \text{ lb}\cdot\text{in.} = 4.233 \text{ lb}\cdot\text{ft}$$

$$T_A + V_A = T_B + V_B: \quad 0 + 10.5625 = \frac{1.5v_B^2}{32.2} + 4.233$$

$v_B = 11.66$ ft/s ◀

PROBLEM 13.59

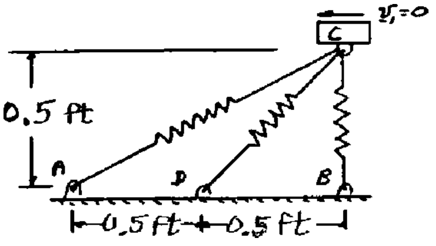
A 3-lb collar C may slide without friction along a horizontal rod. It is attached to three springs, each of constant $k = 2$ lb/in. and 6 in. undeformed length. Knowing that the collar is released from rest in the position shown, determine the maximum speed it will reach in the ensuing motion.

SOLUTION

Maximum velocity occurs at E where collar is passing through position of equilibrium.

Position ①

$$T_1 = 0$$



Note: Undeformed length of springs is 6 in. = 0.5 ft.

Spring AC: $L = \sqrt{(1\text{ ft})^2 + (0.5\text{ ft})^2} = 1.1180$ ft

$\Delta = 1.1180 - 0.50 = 0.6180$ ft

Spring CD: $L = \sqrt{(0.5\text{ ft})^2 + (0.5\text{ ft})^2} = 0.70711$ ft

$\Delta = 0.70711 - 0.50 = 0.20711$ ft

Spring BD: $L = 0.50$ ft, $\Delta = 0$

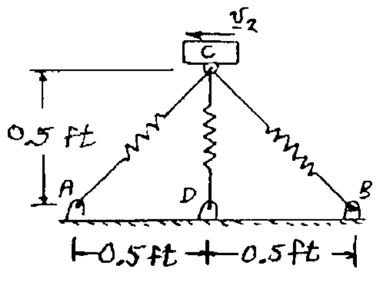
Potential energy. ($k = 2$ lb/in. = 24 lb/ft for each spring)

$$V_1 = \Sigma \frac{1}{2} k\Delta^2 = \frac{1}{2} k \Sigma\Delta^2 = \frac{1}{2}(24\text{ lb/ft})[(0.6180\text{ ft})^2 + (0.20711\text{ ft})^2 + 0]$$

$$V_1 = 5.0983\text{ lb}\cdot\text{ft}$$

Position ②

$$m = \frac{3.0\text{ lb}}{32.2\text{ ft/s}^2} = 0.093168\text{ slug}; \quad T_2 = \frac{1}{2} m v_2^2 = \frac{1}{2}(0.093168\text{ slug})\, v_2^2$$



Spring AC: $L = \sqrt{(0.5\text{ ft})^2 + (0.5\text{ ft})^2} = 0.7071067$ ft

$\Delta = 0.70711 - 0.50 = 0.20711$ ft

Spring CD: $L = 0.50$ ft

$\Delta = 0$

Spring BC: $L = \sqrt{(0.5\text{ ft})^2 + (0.5\text{ ft})^2} = 0.7071067$ ft

$\Delta = 0.70711 - 0.50 = 0.20711$ ft

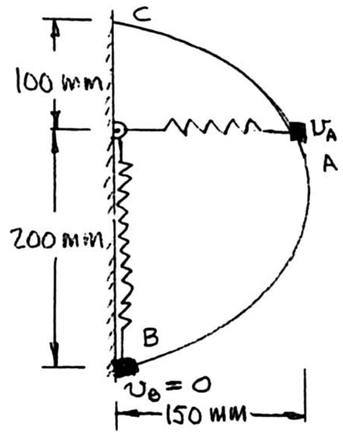
PROBLEM 13.60

A 500-g collar can slide without friction on the curved rod BC in a *horizontal* plane. Knowing that the undeformed length of the spring is 80 mm and that $k = 400$ kN/m, determine (*a*) the velocity that the collar should be given at A to reach B with zero velocity, (*b*) the velocity of the collar when it eventually reaches C.

SOLUTION

(*a*) Velocity at A:



$$T_A = \frac{1}{2}mv_A^2 = \left(\frac{0.5}{2}\text{ kg}\right)v_A^2$$

$$T_A = (0.25)v_A^2$$

$$\Delta L_A = 0.150\text{ m} - 0.080\text{ m}$$

$$\Delta L_A = 0.070\text{ m}$$

$$V_A = \frac{1}{2}k(\Delta L_A)^2$$

$$V_A = \frac{1}{2}(400\times 10^3\text{ N/m})(0.070\text{ m})^2$$

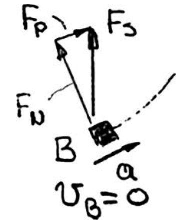
$$V_A = 980\text{ J}$$

$$v_B = 0 \qquad T_B = 0$$

$$\Delta L_B = 0.200\text{ m} - 0.080\text{ m} = 0.120\text{ m}$$

$$V_B = \frac{1}{2}k(\Delta L_B)^2 = \frac{1}{2}(400\times 10^3\text{ N/m})(0.120\text{ m})^2$$

$$V_B = 2880\text{ J}$$



Substitute into conservation of energy.

$$T_A + V_A = T_B + V_B \qquad 0.25v_A^2 + 980 = 0 + 2880$$

$$v_A^2 = \frac{(2880 - 980)}{(0.25)}$$

$$v_A^2 = 7600\text{ m}^2/\text{s}^2$$

$v_A = 87.2$ m/s ◀

PROBLEM 13.61

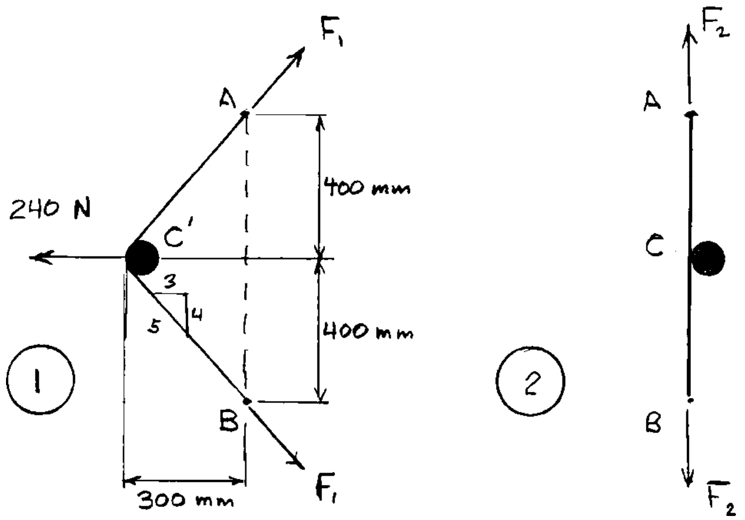
An elastic cord is stretched between two Points A and B, located 800 mm apart in the same horizontal plane. When stretched directly between A and B, the tension is 40 N. The cord is then stretched as shown until its midpoint C has moved through 300 mm to C'; a force of 240 N is required to hold the cord at C'. A 0.1 kg pellet is placed at C', and the cord is released. Determine the speed of the pellet as it passes through C.

SOLUTION

Let ℓ = undeformed length of cord.

Position 1. Length $AC'B = 1.0$ m; Elongation $= x_1 = 1.0 - \ell$

$$\Sigma F_x = 0:\quad 2\left(\frac{3}{5}F_1\right) - 240\text{ N} = 0 \quad F_1 = 200\text{ N}$$



Position 2. Length $ACB = 0.8$ m; Elongation $= x_2 = 0.8 - \ell$

Given $F_2 = 40$ N

$$F_1 = kx,\quad F_2 = kx_2$$

$$F_1 - F_2 = k(x_1 - x_2)$$

$$200 - 40 = k[(1.0 - \ell) - (0.8 - \ell)] = 0.2k$$

$$k = \frac{160}{0.2} = 800\text{ N/m}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$x_1 = \frac{F_1}{k} = \frac{200 \text{ N}}{800 \text{ N/m}} = 0.25 \text{ m}$$

$$x_2 = \frac{F_2}{k} = \frac{40 \text{ N}}{800 \text{ N/m}} = 0.05 \text{ m}$$

Position ①: $T_1 = 0 \qquad V_1 = \frac{1}{2}kx_1^2 = \frac{1}{2}(800 \text{ N/m})(0.25 \text{ m})^2 = 25.0 \text{ N} \cdot \text{m}$

Position②: $m = 0.10 \text{ kg}$

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(0.1 \text{ kg})v_2^2 = 0.05v_2^2$$

$$V_2 = \frac{1}{2}kx_2^2 = \frac{1}{2}(800 \text{ N/m})(0.05 \text{ m})^2 = 1 \text{ N} \cdot \text{m}$$

Conservation of energy:

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 25.0 \text{ N} \cdot \text{m} = 0.05v_2^2 + 1.0 \text{ N} \cdot \text{m}$$

$$24.0 = 0.05v_2^2 \qquad v_2 = 21.909 \text{ m/s} \qquad v_2 = 21.9 \text{ m/s} \blacktriangleleft$$

Note: The horizontal force applied at the midpoint of the cord is not proportional to the horizontal distance $C'C$. A solution based on the work of the horizontal force would be rather involved.

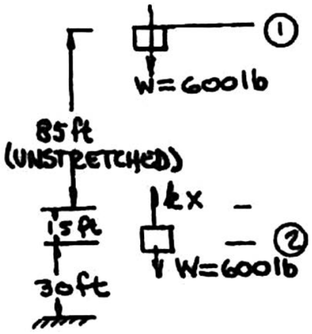
PROBLEM 13.62

An elastic cable is to be designed for bungee jumping from a tower 130 ft high. The specifications call for the cable to be 85 ft long when unstretched, and to stretch to a total length of 100 ft when a 600-lb weight is attached to it and dropped from the tower. Determine (*a*) the required spring constant k of the cable, (*b*) how close to the ground a 186-lb man will come if he uses this cable to jump from the tower.

SOLUTION

(*a*) Conservation of energy:

$$V_1 = 0 \quad T_1 = 0 \quad V_1 = 100\,W$$



Datum at ②:

$$V_1 = (100 \text{ ft})(600 \text{ lb})$$
$$= 6\times 10^4 \text{ ft}\cdot\text{lb}$$

$$V_2 = 0 \quad T_2 = 0$$

$$V_2 = V_g + V_e = 0 + \frac{1}{2}k\,(15 \text{ ft})^2$$

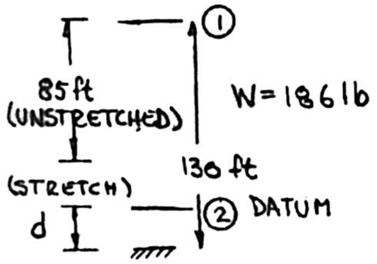
$$T_1 + V_1 = T_2 + V_2$$

$$0 + 6\times 10^4 = 0 + (112.5)k$$

$$k = 533 \text{ lb/ft} \;◀$$

(*b*) From (*a*), $k = 533$ lb/ft

$$T_1 = 0$$
$$W = 186 \text{ lb}$$
$$V_1 = (186)(130 - d)$$
$$T_2 = 0$$



Datum:

$$V_2 = V_g + V_e = 0 + \frac{1}{2}(533)(130 - 85 - d)^2$$

$$V_2 = (266.67)(45 - d)^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.62 (Continued)

$d =$ distance from the ground $\qquad T_1 + V_1 = T_2 + V_2$

$$0 + (186)(130 - d) = 0 + (266.67)(45 - d)^2$$

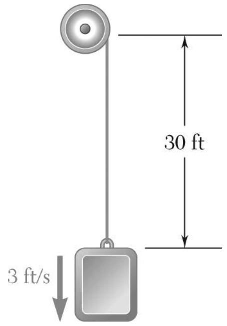
$$266.7d^2 - 23815d + 515827 = 0$$

$$d = \frac{23815 \mp \sqrt{(23815)^2 - 4(266.7)(515827)}}{(2)(266.7)} = \begin{matrix} 36.99 \text{ ft} \\ 52.3 \text{ ft} \end{matrix}$$

Discard 52.3 ft (since the cord acts in compression when rebound occurs).

$d = 37.0$ ft ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.63

It is shown in mechanics of materials that the stiffness of an elastic cable is $k = AE/L$ where A is the cross sectional area of the cable, E is the modulus of elasticity and L is the length of the cable. A winch is lowering a 4000-lb piece of machinery using at a constant speed of 3ft/s when the winch suddenly stops. Knowing that the steel cable has a diameter of 0.4 in., $E = 29 \times 10^6$ lb/in^2, and when the winch stops $L = 30$ ft, determine the maximum downward displacement of the piece of machinery from the point it was when the winch stopped.

SOLUTION

Mass of machinery: $m = \frac{W}{g} = \frac{4000}{32.2} = 124.22 \text{ lb} \cdot \text{s}^2/\text{ft}$

Let position 1 be the state just before the winch stops and the gravitational potential V_g be equal to zero at this state.

For the cable, $A = \frac{\pi}{4}(\text{diameter})^2 = \frac{\pi}{4}(0.4 \text{ in.})^2 = 0.12566 \text{ in}^2$

$$AE = (0.12556 \text{ in.}^2)(29 \times 10^6 \text{ lb/in}^2) = 3.6442 \times 10^6 \text{ lb}$$

For $L = 30$ ft, $k = \frac{AE}{L} = \frac{3.6442 \times 10^6 \text{ lb}}{30 \text{ ft}} = 121.47 \times 10^3 \text{ lb/ft}$

Initial force in cable (equilibrium): $F_1 = W = 4000$ lb.

Elongation in position 1: $x_1 = \frac{F_1}{k} = \frac{4000}{121.47 \times 10^3} = 0.03293 \text{ ft}$

Potential energy: $V_1 = \frac{1}{2}kx_1^2 = \frac{F_1^2}{2k}$

$$V_1 = \frac{(4000 \text{ lb})^2}{(2)(121.47 \times 10^3 \text{ lb/ft})} = 65.860 \text{ ft} \cdot \text{lb}$$

Kinetic energy: $T_1 = \frac{1}{2}mv_1^2$

$$T_1 = \frac{1}{2}(124.22 \text{ lb} \cdot \text{s}^2/\text{ft})(3 \text{ ft/s}^2) = 558.99 \text{ ft} \cdot \text{lb}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.63 (Continued)

Let position 2 be the position of maximum downward displacement. Let x_2 be the elongation in this position.

Potential energy: $$V_2 = \frac{1}{2}kx_2^2 - W(x_2 - x_1)$$

$$V_2 = \frac{1}{2}(121.47\times 10^3)x_2^2 - (4000)(x_2 - 0.03293)$$
$$= 60.735\times 10^3 x^2 - 4000x_2 + 131.72$$

Kinetic energy: $T_2 = 0$ (since $v_2 = 0$)

Principle of work and energy: $T_1 + V_1 = T_2 + V_2$

$$558.99 + 65.860 = 60.735\times 10^3 x_2^2 - 4000x_2 + 131.72$$
$$60.735\times 10^3 x_2^2 - 4000x_2 - 493.13 = 0$$
$$x_2 = 0.12887 \text{ ft}$$

Maximum displacement: $\delta = x_2 - x_1 = 0.09594$ ft $\qquad \delta = 1.151$ in.

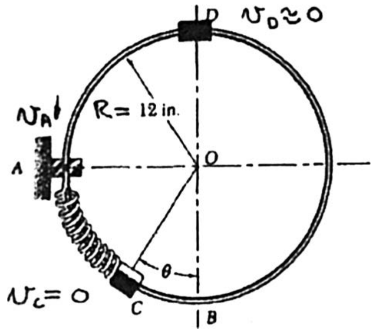
PROBLEM 13.66

A thin circular rod is supported in a *vertical plane* by a bracket at *A*. Attached to the bracket and loosely wound around the rod is a spring of constant $k = 3$ lb/ft and undeformed length equal to the arc of circle *AB*. An 8-oz collar *C*, not attached to the spring, can slide without friction along the rod. Knowing that the collar is released from rest at an angle θ with the vertical, determine (*a*) the smallest value of θ for which the collar will pass through *D* and reach Point *A*, (*b*) the velocity of the collar as it reaches Point *A*.

SOLUTION

(*a*) Smallest angle θ occurs when the velocity at *D* is close to zero.



$$v_C = 0 \qquad v_D = 0$$
$$T_C = 0 \qquad T_D = 0$$
$$V = V_e + V_g$$

Point *C*:

$$R = 12 \text{ in.} = 1 \text{ ft}$$

$$\Delta L_{BC} = (1 \text{ ft})(\theta) = \theta \text{ ft}$$
$$(V_C)_e = \frac{1}{2}k(\Delta L_{BC})^2$$
$$(V_C)_e = \frac{3}{2}\theta^2$$
$$(V_C)_g = WR(1-\cos\theta)$$
$$(V_C)_g = \left(\frac{8 \text{ oz}}{16 \text{ oz/lb}}\right)(1 \text{ ft})(1-\cos\theta)$$
$$(V_C)_g = \frac{1}{2}(1-\cos\theta)$$
$$V_C = (V_C)_e + (V_C)_g = \frac{3}{2}\theta^2 + \frac{1}{2}(1-\cos\theta)$$

Point *D*:

$$(V_D)_e = 0 \quad \text{(spring is unattached)}$$
$$(V_D)_g = W(2R) = (2)(0.5 \text{ lb})(1 \text{ ft}) = 1 \text{ lb}\cdot\text{ft}$$
$$T_C + V_C = T_D + V_D \qquad 0 + \frac{3}{2}\theta^2 + \frac{1}{2}(1-\cos\theta) = 1$$
$$(1.5)\theta^2 - (0.5)\cos\theta = 0.5$$

By trial, $\theta = 0.7592$ rad $\qquad \theta = 43.5°$ ◀

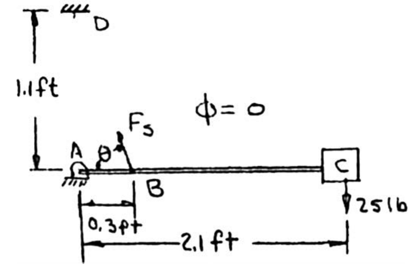
PROBLEM 13.67

The system shown is in equilibrium when $\phi = 0$. Knowing that initially $\phi = 90°$ and that block C is given a slight nudge when the system is in that position, determine the velocity of the block as it passes through the equilibrium position $\phi = 0$. Neglect the weight of the rod.

SOLUTION

Find the unstretched length of the spring.



$$\theta = \tan^{-1}\frac{1.1}{0.3}$$
$$= 1.3045 \text{ rad}$$
$$\theta = 74.745°$$
$$L_{BD} = \sqrt{(1.1)^2 + .3^2}$$
$$L_{BD} = 1.140 \text{ ft}$$

Equilibrium
$$\Sigma M_A = (0.3)(F_s \sin\theta) - (25)(2.1) = 0$$
$$F_s = \frac{(25 \text{ lb})(2.1 \text{ ft})}{(0.3 \text{ ft})(\sin 74.745°)}$$
$$= 181.39 \text{ lb}$$
$$F_s = k\Delta L_{BD}$$

$$181.39 \text{ lb} = (600 \text{ lb/ft})(\Delta L_{BD})$$
$$\Delta L_{BD} = 0.30232 \text{ ft}$$

Unstretched length
$$L_0 = L_{BD} - \Delta L_{BD}$$
$$L_0 = 1.140 - 0.3023$$
$$= 0.83768 \text{ ft}$$

Spring elongation, $\Delta L'_{BD}$, when $\phi = 90°$.

$$\Delta L'_{BD} = (1.1 \text{ ft} + 0.3 \text{ ft}) - L_0$$
$$\Delta L'_{BD} = 1.4 \text{ ft} - 0.8377 \text{ ft}$$
$$= 0.56232 \text{ ft}$$

PROBLEM 13.68

A spring is used to stop a 50-kg package which is moving down a 20º incline. The spring has a constant $k = 30$ kN/m and is held by cables so that it is initially compressed 50 mm. Knowing that the velocity of the package is 2 m/s when it is 8 m from the spring and neglecting friction, determine the maximum additional deformation of the spring in bringing the package to rest.

SOLUTION

Let position 1 be the starting position 8 m from the end of the spring when it is compressed 50 mm by the cable. Let position 2 be the position of maximum compression. Let x be the additional compression of the spring. Use the principle of conservation of energy. $T_1 + V_1 = T_2 + V_2$.

Position 1:
$$T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}(50)(2)^2 = 100 \text{ J}$$
$$V_{1g} = mgh_1 = (50)(9.81)(8\sin 20°) = 1342.09 \text{ J}$$
$$V_{1e} = \frac{1}{2}ke_1^2 = \frac{1}{2}(30\times 10^3)(0.050)^2 = 37.5 \text{ J}$$

Position 2:
$$T_2 = \frac{1}{2}mv_2^2 = 0 \quad \text{since} \quad v_2 = 0.$$
$$V_{2g} = mgh_2 = (50)(9.81)(-x\sin 20°) = -167.76x$$
$$V_{2e} = \frac{1}{2}ke_2^2 = \frac{1}{2}(30\times 10^3)(0.05+x)^2 = 37.5 + 1500x + 15000x^2$$

Principle of conservation of energy:
$$100 + 1342.09 + 37.5 = -167.61x + 37.5 + 1500x + 15000x^2$$
$$15,000x^2 + 1332.24x - 1442.09 = 0$$

Solving for x,
$$x = 0.26882 \quad \text{and} \quad -0.357\,64$$

$x = 0.269$ m ◀

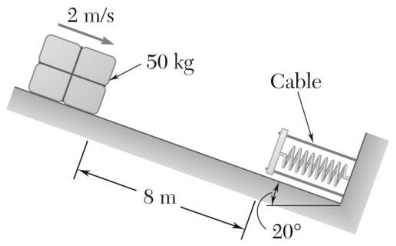
PROBLEM 13.69



Solve Problem 13.68 assuming the kinetic coefficient of friction between the package and the incline is 0.2.

PROBLEM 13.68 A spring is used to stop a 50-kg package which is moving down a 20° incline. The spring has a constant $k = 30$ kN/m and is held by cables so that it is initially compressed 50 mm. Knowing that the velocity of the package is 2 m/s when it is 8 m from the spring and neglecting friction, determine the maximum additional deformation of the spring in bringing the package to rest.

SOLUTION

Let position 1 be the starting position 8 m from the end of the spring when it is compressed 50 mm by the cable. Let position 2 be the position of maximum compression. Let x be the additional compression of the spring. Use the principle of work and energy. $T_1 + V_1 + U_{1\to 2} = T_2 + V_2$

Position 1.
$$T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}(50)(2)^2 = 100\text{ J}$$
$$V_{1g} = mgh_1 = (50)(9.81)(8\sin 20°) = 1342.09\text{ J}$$
$$V_{1e} = \frac{1}{2}ke_1^2 = \frac{1}{2}(30\times 10^3)(0.05)^2 = 37.5\text{ J}$$

Position 2.
$$T_2 = \frac{1}{2}mv_2^2 = 0 \quad \text{since} \quad v_2 = 0.$$
$$V_{2g} = mgh_2 = (50)(9.81)(-x\sin 20°) = -167.76x$$
$$V_{2e} = \frac{1}{2}ke_2^2 = \frac{1}{2}(30\times 10^3)(0.05 + x)^2 = 37.5 + 1500x + 15{,}000x^2$$

Work of the friction force.
$$+\nearrow \ \Sigma F_n = 0$$
$$N - mg\cos 20° = 0$$
$$N = mg\cos 20°$$
$$= (50)(9.81)\cos 20°$$
$$= 460.92\text{ N}$$
$$F_f = \mu_k N$$
$$= (0.2)(460.92)$$
$$= 92.184$$
$$U_{1\to 2} = -F_f d$$
$$= -92.184(8 + x)$$
$$= -737.47 - 92.184x$$

PROBLEM 13.70

A section of track for a roller coaster consists of two circular arcs *AB* and *CD* joined by a straight portion *BC*. The radius of *AB* is 27 m and the radius of *CD* is 72 m. The car and its occupants, of total mass 250 kg, reach Point *A* with practically no velocity and then drop freely along the track. Determine the normal force exerted by the track on the car as the car reaches point *B*. Ignore air resistance and rolling resistance.

SOLUTION

Calculate the speed of the car as it reaches Point *B* using the principle of conservation of energy as the car travels from position *A* to position *B*.

Position *A*: $v_A = 0, \quad T_A = \frac{1}{2}mv_A^2 = 0, \quad V_A = 0$ (datum)

Position *B*: $V_B = -mgh$

where h is the decrease in elevation between *A* and *B*.

$$T_B = \frac{1}{2}mv_B^2$$

Conservation of energy: $T_A + V_A = T_B + V_B$:

$$0 + 0 = \frac{1}{2}mv_B^2 - mgh$$

$$v_B^2 = 2gh$$

$$= (2)(9.81 \text{ m/s}^2)(27 \text{ m})(1 - \cos 40°)$$

$$= 123.94 \text{ m}^2/\text{s}^2$$

Normal acceleration at *B*:

$$(a_B)_n = \frac{v_B^2}{\rho} = \frac{123.94 \text{ m}^2/\text{s}^2}{27 \text{ m}} = 4.59 \text{ m/s}^2$$

$$(\mathbf{a}_B)_n = 4.59 \text{ m/s}^2 \nearrow 50°$$

Apply Newton's second law to the car at *B*.

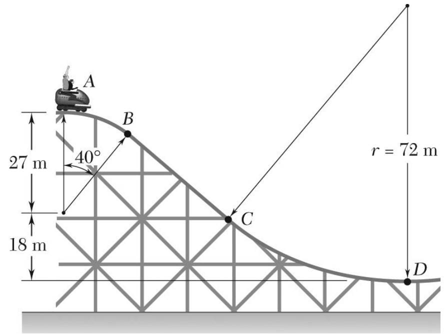
PROBLEM 13.71



A section of track for a roller coaster consists of two circular arcs *AB* and *CD* joined by a straight portion *BC*. The radius of *AB* is 27 m and the radius of *CD* is 72 m. The car and its occupants, of total mass 250 kg, reach Point *A* with practically no velocity and then drop freely along the track. Determine the maximum and minimum values of the normal force exerted by the track on the car as the car travels from *A* to *D*. Ignore air resistance and rolling resistance.

SOLUTION

Calculate the speed of the car as it reaches Point *P*, any point on the roller coaster track. Apply the principle of conservation of energy.

Position *A*: $v_A = 0, \quad T_A = \frac{1}{2}mv_A^2 = 0, \quad V_A = 0$ (datum)

Position *P*: $V_P = -mgh$

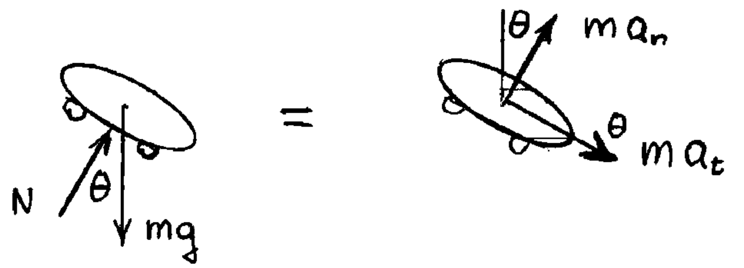
where *h* is the decrease in elevation along the track.

$$T_P = \frac{1}{2}mv^2$$

Conservation of energy: $T_A + V_A = T_P + V_P$

$$0 + 0 = \frac{1}{2}mv^2 - mgh \qquad v^2 = 2gh \qquad (1)$$

Calculate the normal force using Newton's second law. Let θ be the slope angle of the track.



$$\Sigma F_n = ma_n: \quad N - mg\cos\theta = ma_n$$

$$N = mg\cos\theta + ma_n \qquad (2)$$

Over portion *AB* of the track, $h = \rho(1 - \cos\theta)$

and $a_n = -\dfrac{mv^2}{\rho}$

PROBLEM 13.73

A 10-lb collar is attached to a spring and slides without friction along a fixed rod in a vertical plane. The spring has an undeformed length of 14 in. and a constant $k = 4$ lb/in. Knowing that the collar is released from rest in the position shown, determine the force exerted by the rod on the collar at (*a*) Point *A*, (*b*) Point *B*. Both these points are on the curved portion of the rod.

SOLUTION

Mass of collar: $$m = \frac{W}{g} = \frac{10}{32.2} = 0.31056 \text{ lb} \cdot \text{s}^2/\text{ft}$$

Let position 1 be the initial position shown, and calculate the potential energies of the spring for positions 1, *A*, and *B*. $l_0 = 14$ in.

$$l_1 = \sqrt{(14+14)^2 + (14)^2} = 31.305 \text{ in.}$$
$$x_1 = l_1 - l_0 = 31.305 - 14 = 17.305 \text{ in.}$$
$$(V_1)_e = \frac{1}{2}kx_1^2 = \frac{1}{2}(4)(17.305)^2 = 598.92 \text{ in} \cdot \text{lb} = 49.910 \text{ ft} \cdot \text{lb}$$

$$l_A = \sqrt{(14)^2 + (14)^2} = 19.799 \text{ in.}$$
$$x_A = l_A - l_0 = 19.799 - 14 = 5.799 \text{ in.}$$
$$(V_A)_e = \frac{1}{2}kx_A^2 = \frac{1}{2}(4)(5.799)^2 = 67.257 \text{ in} \cdot \text{lb} = 5.605 \text{ ft} \cdot \text{lb}$$

$$l_B = 14 + 14 = 28 \text{ in.}$$
$$x_B = l_B - l_0 = 28 - 14 = 14 \text{ in.}$$
$$(V_B)_e = \frac{1}{2}kx_B^2 = \frac{1}{2}(4)(14)^2 = 392 \text{ in} \cdot \text{lb} = 32.667 \text{ ft} \cdot \text{lb}$$

Gravitational potential energies: Datum at level *A*.

$$(V_1)_g = 0 \quad (V_A)_g = 0$$

$$(V_B)g = Wy = (10 \text{ lb})(-14 \text{ in.}) = -140 \text{ in} \cdot \text{lb} = -11.667 \text{ ft} \cdot \text{lb}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Total potential energies: $V = V_e + V_g$

$V_1 = 49.910 \text{ ft} \cdot \text{lb}, \;\; V_A = 5.605 \text{ ft} \cdot \text{lb}, \;\; V_B = 21.0 \text{ ft} \cdot \text{lb}$

Kinetic energies: $T_1 = 0$

$$T_A = \frac{1}{2} m v_A^2 = \frac{1}{2}(0.31056) v_A^2 = 0.15528 v_A^2$$

$$T_B = \frac{1}{2} m v_B^2 = \frac{1}{2}(0.31056) v_B^2 = 0.15528 v_B^2$$

Conservation of energy: $T_1 + V_1 = T_A + V_A$:

$$0 + 49.910 = 0.15528 v_A^2 + 5.605 \qquad v_A^2 = 285.32 \text{ ft}^2/\text{s}^2$$

Conservation of energy: $T_1 + V_1 = T_B + V_B$

$$0 + 49.910 = 0.15528 v_B^2 + 21.0 \qquad v_B^2 = 186.18 \text{ ft}^2/\text{s}^2$$

Normal accelerations at *A* and *B*. $a_n = v^2/\rho$

$$\rho = 14 \text{ in.} = 1.16667 \text{ ft}$$

$$(a_A)_n = \frac{285.32 \text{ ft}^2/\text{s}^2}{1.16667 \text{ ft}} \qquad (\mathbf{a}_A)_n = 244.56 \text{ ft/s}^2 \downarrow$$

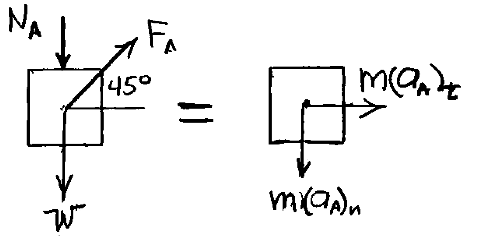
$$(a_B)_n = \frac{189.10 \text{ ft}^2/\text{s}^2}{1.16667 \text{ ft}} \qquad (\mathbf{a}_B)_n = 159.58 \text{ ft/s}^2 \longleftarrow$$

Spring forces at *A* and *B*: $F = kx$

$$F_A = (4 \text{ lb/in.})(5.799 \text{ in.}) \qquad \mathbf{F}_A = 23.196 \text{ lb} \;\angle 45^\circ$$

$$F_B = (4 \text{ lb/in.})(14 \text{ in.}) \qquad \mathbf{F}_B = 56.0 \text{ lb} \uparrow$$

To determine the forces ($\mathbf{N}_A$ and $\mathbf{N}_B$) exerted by the rod on the collar, apply Newton's second law.



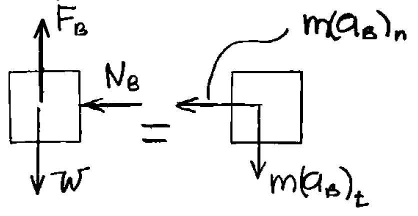
(*a*) At Point *A*:

$\downarrow \Sigma F = m(a_A)_n$:

$$W + N_A - F_A \sin 45^\circ = m(a_A)_n$$

$$10 + N_A - 23.196 \sin 45^\circ = (0.31056)(244.56)$$

$$\mathbf{N}_A = 82.4 \text{ lb} \downarrow \blacktriangleleft$$



(*b*) At Point *B:*

$\overset{+}{\longleftarrow} \Sigma F = m(a_B)_n$:

$$N_B = (0.31056)(159.58) \qquad \mathbf{N}_B = 49.6 \text{ lb} \longleftarrow \blacktriangleleft$$

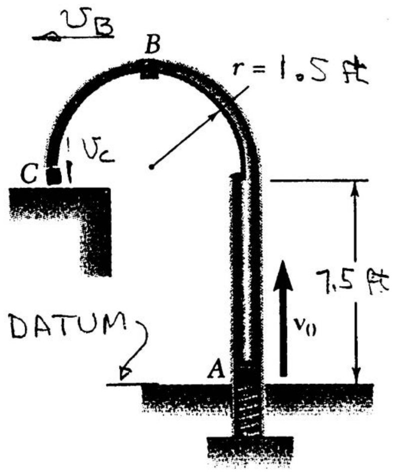
PROBLEM 13.74

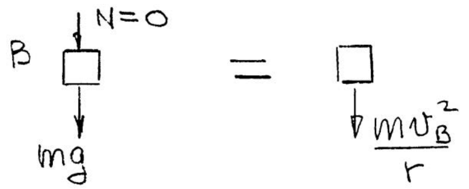
An 8-oz package is projected upward with a velocity $\mathbf{v}_0$ by a spring at A; it moves around a frictionless loop and is deposited at C. For each of the two loops shown, determine (*a*) the smallest velocity $\mathbf{v}_0$ for which the package will reach C, (*b*) the corresponding force exerted by the package on the loop just before the package leaves the loop at C.

SOLUTION

Loop 1



(*a*) The smallest velocity at B will occur when the force exerted by the tube on the package is zero.



$$+\downarrow \Sigma F = 0 + mg = \frac{mv_B^2}{r}$$

$$v_B^2 = rg = 1.5 \text{ ft}(32.2 \text{ ft/s}^2)$$

$$v_B^2 = 48.30$$

At A

$$T_A = \frac{1}{2}mv_0^2$$

$$V_A = 0 \quad \left(8 \text{ oz} = 0.5 \text{ lb} \Rightarrow = \frac{0.5}{32.2} = 0.01553\right)$$

At B

$$T_B = \frac{1}{2}mv_B^2 = \frac{1}{2}m(48.30) = 24.15 \text{ m}$$

$$V_B = mg(7.5 + 1.5) = 9mg = 9(0.5) = 4.5 \text{ lb}\cdot\text{ft}$$

$$T_A + V_A = T_B + V_B: \quad \frac{1}{2}(0.01553)v_0^2 = 24.15(0.01553) + 4.5$$

$$v_0^2 = 627.82 \qquad v_0 = 25.056 \qquad v_0 = 25.1 \text{ ft/s} \blacktriangleleft$$

At C

$$T_C = \frac{1}{2}mv_C^2 = 0.007765v_C^2 \qquad V_C = 7.5mg = 7.5(0.5) = 3.75$$

$$T_A + V_A = T_C + V_C: \quad 0.007765v_0^2 = 0.007765v_C^2 + 3.75$$

$$0.007765(25.056)^2 - 3.75 = 0.007765v_C^2$$

$$v_C^2 = 144.87$$

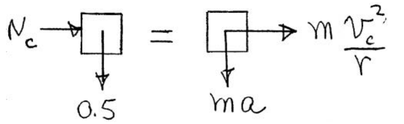
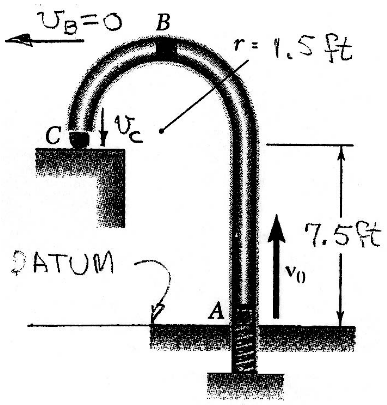
(*b*)



$$\xrightarrow{+} \Sigma F = ma_n: \quad N = 0.01553\frac{(144.87)}{1.5}$$

$$N = 1.49989$$

Loop 2



(2)

{Package in tube} $N_C = 1.500 \text{ lb} \longleftarrow$ ◀

(*a*) At *B*, tube supports the package so,

$$v_B \approx 0$$

$$v_B = 0, \; T_B = 0 \qquad V_B = mg(7.5 + 1.5)$$

$$= 4.5 \text{ lb}\cdot\text{ft}$$

$$T_A + V_A = T_B + V_B$$

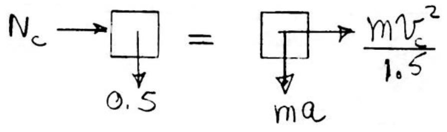
$$\frac{1}{2}(0.01553)v_A^2 = 4.5 \Rightarrow v_A = 24.073$$

$v_A = 24.1 \text{ ft/s}$ ◀

(*b*) At *C* $\qquad T_C = 0.007765v_C^2, \; V_C = 7.5mg = 3.75$

$$T_A + V_A = T_C + V_C: \quad 0.007765(24.073)^2 = 0.007765v_C^2 + 3.75$$

$$v_C^2 = 96.573$$



$$N_C = 0.01553\left(\frac{96.573}{1.5}\right) = 0.99985$$

{Package on tube} $N_C = 1.000$ lb ◀

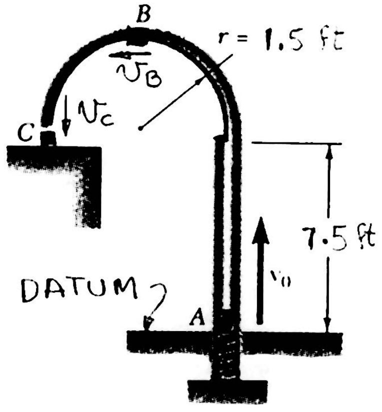
PROBLEM 13.75

If the package of Problem 13.74 is not to hit the horizontal surface at C with a speed greater than 10 ft/s, (a) show that this requirement can be satisfied only by the second loop, (b) determine the largest allowable initial velocity $\mathbf{v}_0$ when the second loop is used.

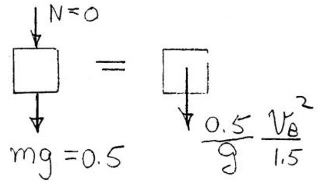
SOLUTION



(1)

(a) Loop 1

From Problem 13.74, at B



$$v_B^2 = gr = 48.3 \text{ ft}^2/\text{s}^2 \Rightarrow v_B = 6.9498 \text{ ft/s}$$

$$T_B = \frac{1}{2}mv_B^2 = \frac{1}{2}(0.01553)(48.3) = 0.37505$$

$$V_B = mg(7.5 + 1.5) = (0.5)(9) = 4.5 \text{ lb}\cdot\text{ft}$$

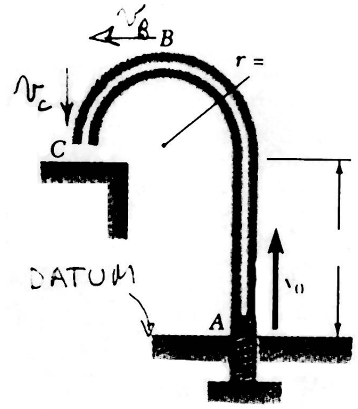
$$T_C = \frac{1}{2}mv_C^2 = \frac{1}{2}(0.01553)v_C^2 = 0.007765v_C^2$$

$$V_C = 7.5(0.5) = 3.75 \text{ lb}\cdot\text{ft}$$

$$T_B + V_B = T_C + V_C: \quad 0.37505 + 4.5 = 0.007765v_C^2 + 3.75$$

$$v_C^2 = 144.887 \Rightarrow v_C = 12.039 \text{ ft/s}$$

12.04 ft/s > 10 ft/s ⇒ Loop (1) does not work ◀



(2)

(b) Loop 2 at A $\quad T_A = \frac{1}{2}mv_0^2 = 0.007765v_0^2$

$$V_A = 0$$

At C assume $\quad v_C = 10$ ft/s

$$T_C = \frac{1}{2}mv_C^2 = 0.007765(10)^2 = 0.7765$$

$$v_C = 7.5(0.5) = 3.75$$

$$T_A + V_A = T_C + V_C: \quad 0.007765v_0^2 = 0.7765 + 3.75$$

$$v_0 = 24.144 \qquad v_0 = 24.1 \text{ ft/s} ◀$$

PROBLEM 13.77

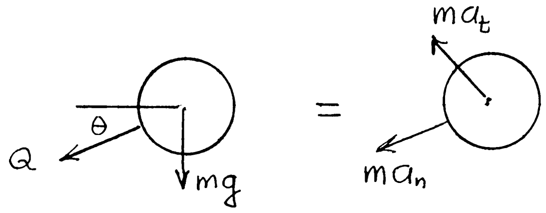
The 1 kg ball at A is suspended by an inextensible cord and given an initial horizontal velocity of 5 m/s. If $l = 0.6$ m and $x_B = 0$, determine y_B so that the ball will enter the basket.

SOLUTION

Let position 1 be at A. $\qquad v_1 = v_0$

Let position 2 be the point described by the angle where the path of the ball changes from circular to parabolic. At position 2, the tension Q in the cord is zero.

Relationship between v_2 and θ based on $Q = 0$. Draw the free body diagram.



$$+\swarrow \Sigma F = 0: \quad Q + mg\sin\theta = ma_n = \frac{mv_2^2}{l}$$

With $\quad Q = 0, \quad v_2^2 = gl\sin\theta \quad$ or $\quad v_2 = \sqrt{gl\sin\theta} \qquad (1)$

Relationship among v_0, v_2 and θ based on conservation of energy.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_0^2 - mgl = \frac{1}{2}mv_2^2 + mgl\sin\theta$$

$$v_0^2 - v_2^2 = 2gl(1 + \sin\theta) \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Eliminating v_2 from Eqs. (1) and (2),

$$v_0^2 - gl\sin\theta = 2gl(1+\sin\theta)$$

$$\sin\theta = \frac{1}{3}\left[\frac{v_0^2}{gl} - 2\right] = \frac{1}{3}\left[\frac{(5)^2}{(9.81)(0.6)} - 2\right] = 0.74912$$

$$\theta = 48.514°$$

From Eq. (1), $$v_2^2 = (9.81)(0.6)\sin 48.514° = 4.4093 \text{ m}^2/\text{s}^2$$

$$v_2 = 2.0998 \text{ m/s}$$

x and y coordinates at position 2.

$$x_2 = l\cos\theta = 0.6\cos 48.514° = 0.39746 \text{ m}$$

$$y_2 = l\sin\theta = 0.6\sin 48.514° = 0.44947 \text{ m}$$

Let t_2 be the time when the ball is a position 2.

Motion on the parabolic path. The horizontal motion is

$$\dot{x} = -v_2\sin\theta = -2.0998\sin 48.514° = -1.5730 \text{ m/s}$$

$$x = x_2 - 1.5730(t - t_2)$$

At Point B, $$x_B = 0$$

$$0 = 0.39746 - 1.5730(t_B - t_2) \quad t_B - t_2 = 0.25267 \text{ s}$$

The vertical motion is

$$y = y_2 + v_2\cos\theta(t - t_2) - \frac{1}{2}g(t - t_2)^2$$

At Point B, $$y_B = y_2 + v_2\cos\theta(t_B - t_2) - \frac{1}{2}g(t_B - t_2)^2$$

$$y_B = 0.44947 + (2.0998\cos 48.514°)(0.25267) - \frac{1}{2}(9.81)(0.25267)^2$$

$$= 0.48779 \text{ m}$$

$y_B = 0.448$ m ◀

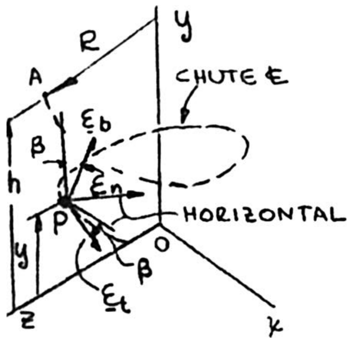
PROBLEM 13.78*

Packages are moved from Point *A* on the upper floor of a warehouse to Point *B* on the lower floor, 12 ft directly below *A*, by means of a chute, the centerline of which is in the shape of a helix of vertical axis *y* and radius *R* = 8 ft. The cross section of the chute is to be banked in such a way that each package, after being released at *A* with no velocity, will slide along the centerline of the chute without ever touching its edges. Neglecting friction, (*a*) express as a function of the elevation *y* of a given Point *P* of the centerline the angle ϕ formed by the normal to the surface of the chute at *P* and the principal normal of the centerline at that point, (*b*) determine the magnitude and direction of the force exerted by the chute on a 20-lb package as it reaches Point *B*. *Hint:* The principal normal to the helix at any Point *P* is horizontal and directed toward the *y* axis, and the radius of curvature of the helix is $\rho = R[1 - (h/2\pi R)^2]$.

SOLUTION

(*a*) At Point *A*: $v_A = 0 \quad T_A = 0$

$$V_A = mgh$$



At any Point *P*: $T_P = \frac{1}{2}mv^2$

$$V_P = Wy = mgy$$

$$T_A + V_A = T_P + V_P$$

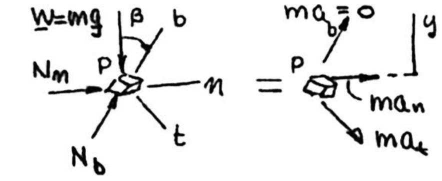
$$0 + mgh = \frac{1}{2}mv^2 + mgy$$

$$v^2 = 2g(h - y)$$

$\mathbf{e}_n$ along principal normal, horizontal and directed toward *y* axis

$\mathbf{e}_t$ tangent to centerline of the chute

$\mathbf{e}_D$ along binormal



$$\beta = \tan^{-1}\frac{h}{2\pi R} = \tan^{-1}\frac{(12\text{ ft})}{2\pi(8\text{ ft})} = 13.427°$$

$$ma_b = 0$$

since $a_b = 0$

Note: Friction is zero,

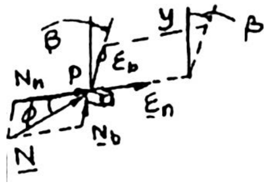
$$\Sigma F_t = ma_t: \quad mg\sin\beta = ma_t \quad a_t = g\sin\beta$$

$$\Sigma F_b = ma_b: \quad N_b - W\cos\beta = 0 \quad N_B = W\cos\beta$$

$$\Sigma F_n = ma_n: \quad N_n = \frac{mv^2}{e} = \frac{m2g(h-y)}{e} = 2W\frac{(h-y)}{e}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

The total normal force is the resultant of $\mathbf{N}_b$ and $\mathbf{N}_m$, it lies in the b–m plane, and forms angle ϕ with m axis.



$$\tan\phi = N_b / N_n$$

$$\tan\phi = W\cos\beta \Big/ \frac{2(w(h-y)}{e}$$

$$\tan\phi = (e/2(h-y))\cos\beta$$

Given: $$e = R\left[1+\left(\frac{h}{2\pi R}\right)^2\right] = R(1+\tan^2\beta) = \frac{R}{\cos^2\beta}$$

Thus, $$\tan\phi = \frac{e}{2(h-y)}\cos\beta = \frac{R}{2(h-y)\cos\beta}$$

$$\tan\phi = \frac{8\text{ ft}}{2(12-y)\cos 13.427°} = \frac{4.112}{12-y}$$

or $\cot\phi = 0.243(12-y)$ ◀

(*b*) At Point *B*: $y = 0$ for *x*, *y*, *z* axes, we write, with $W = 20$ lb,

$$N_x = N_b\sin\beta = W\cos\beta\sin\beta = (20\text{ lb})\cos 13.427°\sin 13.427° \quad N_x = 4.517\text{ lb}$$

$$N_y = N_b\cos\beta = W\cos^2\beta = (20\text{ lb})\cos^2 13.427° \quad N_y = 18.922\text{ lb}$$

$$N_z = -N_n = -2w\frac{h-y}{e} = -2W\frac{h-y}{R/\cos^2\beta}$$

$$N_z = -2(20\text{ lb})\frac{(12\text{ ft-}0)}{8\text{ ft}}\cos^2 13.427° \quad N_z = -56.765\text{ lb}$$

$$N = \sqrt{(4.517)^2 + (18.922)^2 + (-56.765)^2}$$ $N = 60.0$ lb ◀

$$\cos\theta_x = \frac{N_x}{N} = \frac{4.517}{60}$$ $\theta_x = 85.7°$ ◀

$$\cos\theta_y = \frac{N_y}{N} = \frac{18.922}{60}$$ $\theta_y = 71.6°$ ◀

$$\cos\theta_z = \frac{N_z}{N} = -\frac{56.742}{60}$$ $\theta_z = 161.1°$ ◀

PROBLEM 13.79*

Prove that a force $F(x, y, z)$ is conservative if, and only if, the following relations are satisfied:

$$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x} \quad \frac{\partial F_y}{\partial z} = \frac{\partial F_z}{\partial y} \quad \frac{\partial F_z}{\partial x} = \frac{\partial F_x}{\partial z}$$

SOLUTION

For a conservative force, Equation (13.22) must be satisfied.

$$F_x = -\frac{\partial V}{\partial x} \quad F_y = -\frac{\partial V}{\partial y} \quad F_z = -\frac{\partial V}{\partial z}$$

We now write $\quad \dfrac{\partial F_x}{\partial y} = -\dfrac{\partial^2 V}{\partial x \partial y} \quad \dfrac{\partial F_y}{\partial x} = -\dfrac{\partial^2 V}{\partial y \partial x}$

Since $\dfrac{\partial^2 V}{\partial x \partial y} = \dfrac{\partial^2 V}{\partial y \partial x}$: $\quad \dfrac{\partial F_x}{\partial y} = \dfrac{\partial F_y}{\partial x}$ ◀

We obtain in a similar way

$$\frac{\partial F_y}{\partial z} = \frac{\partial F_z}{\partial y} \quad \frac{\partial F_z}{\partial x} = \frac{\partial F_x}{\partial z} \quad ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.80

The force $\mathbf{F} = (yz\mathbf{i} + zx\mathbf{j} + xy\mathbf{k})/xyz$ acts on the particle $P(x, y, z)$ which moves in space. (*a*) Using the relation derived in Problem 13.79, show that this force is a conservative force. (*b*) Determine the potential function associated with $\mathbf{F}$.

SOLUTION

(*a*)

$$F_x = \frac{yz}{xyz} \quad F_y = \frac{zx}{xyz} \quad F_z = \frac{xy}{xyz}$$

$$\frac{\partial F_x}{\partial y} = \frac{\partial\left(\frac{1}{x}\right)}{\partial y} = 0 \quad \frac{\partial F_y}{\partial x} = \frac{\partial\left(\frac{1}{y}\right)}{\partial x} = 0$$

Thus,

$$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x}$$

The other two equations derived in Problem 13.79 are checked in a similar way.

(*b*) Recall that

$$F_x = -\frac{\partial V}{\partial x}, \qquad F_y = -\frac{\partial V}{\partial y}, \qquad F_z = -\frac{\partial V}{\partial z}$$

$$F_x = \frac{1}{x} = -\frac{\partial V}{\partial x} \qquad V = -\ln x + f(y,z) \tag{1}$$

$$F_y = \frac{1}{y} = -\frac{\partial V}{\partial y} \qquad V = -\ln y + g(z,x) \tag{2}$$

$$F_z = \frac{1}{z} = -\frac{\partial V}{\partial z} \qquad V = -\ln z + h(x,y) \tag{3}$$

Equating (1) and (2)

$$-\ln x + f(y,z) = -\ln y + g(z,x)$$

Thus,

$$f(y,z) = -\ln y + k(z) \tag{4}$$

$$g(z,x) = -\ln x + k(z) \tag{5}$$

Equating (2) and (3)

$$-\ln z + h(x,y) = -\ln y + g(z,x)$$

$$g(z,x) = -\ln z + l(x)$$

From (5),

$$g(z,x) = -\ln x + k(z)$$

PROBLEM 13.81*

A force **F** acts on a particle $P(x, y)$ which moves in the xy plane. Determine whether **F** is a conservative force and compute the work of **F** when P describes in a clockwise sense the path A, B, C, A including the quarter circle $x^2 + y^2 = a^2$, if (a) $\mathbf{F} = ky\mathbf{i}$, ($b$) $\mathbf{F} = k(y\mathbf{i} + x\mathbf{j})$.

SOLUTION

(a) $F_x = ky \quad F_y = 0 \quad \dfrac{\partial F_x}{\partial y} = k \quad \dfrac{\partial F_y}{\partial x} = 0$

Thus, $\dfrac{\partial F_x}{\partial y} \neq \dfrac{\partial F_y}{\partial x}$ **F** is not conservative.

$$U_{ABCA} = \oint_{ABCA} \mathbf{F}\cdot d\mathbf{r} = \int_A^B ky\mathbf{i}\cdot dy\mathbf{j} + \int_B^C ky\mathbf{i}\cdot(dx\mathbf{i} + dy\mathbf{j}) + \int_B^A ky\mathbf{i}\cdot dx\mathbf{j}$$

$\int_A^B = 0,$ **F** is perpendicular to the path.

$$\int_B^C ky\mathbf{i}\cdot(dx\mathbf{i} + dy\mathbf{j}) = \int_B^C ky\,dx$$

From B to C, the path is a quarter circle with origin at A.

Thus, $x^2 + y^2 = a^2$

$$y = \sqrt{a^2 - x^2}$$

Along BC, $\displaystyle\int_B^C kydx = \int_0^a k\sqrt{a^2 - x^2}\,dx = \frac{\pi ka^2}{4}$

$$\int_C^A ky\mathbf{i}\cdot dx\mathbf{j} = 0 \quad (y = 0 \text{ on } CA)$$

$$U_{ABCA} = \int_A^B + \int_B^C + \int_C^A = 0 + \frac{\pi ka^2}{4} + 0$$

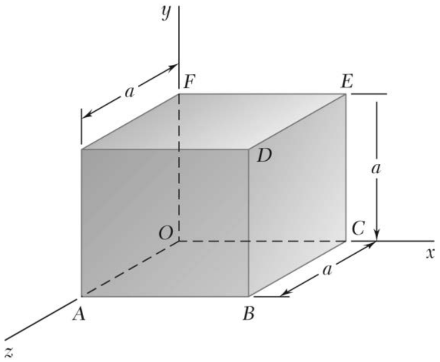
$U_{ABCA} = \dfrac{\pi ka^2}{4}$ ◀

(b) $F_x = ky \quad F_y = kx \quad \dfrac{\partial F_x}{\partial y} = k \quad \dfrac{\partial F_y}{\partial x} = k$

$\dfrac{\partial F_x}{\partial y} = \dfrac{\partial F_y}{\partial x},$ **F** is conservative.

Since $ABCA$ is a closed loop and **F** is conservative, $U_{ABCA} = 0$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.82*

The potential function associated with a force **P** in space is known to be $V(x, y, z) = -(x^2 + y^2 + z^2)^{1/2}$. (*a*) Determine the *x*, *y*, and *z* components of **P**. (*b*) Calculate the work done by **P** from *O* to *D* by integrating along the path *OABD*, and show that it is equal to the negative of the change in potential from *O* to *D*.

SOLUTION

(*a*) $$P_x = -\frac{\partial V}{\partial x} = -\frac{\partial[-(x^2 + y^2 + z^2)^{1/2}]}{\partial x} = x(x^2 + y^2 + z^2)^{-1/2} \quad ◀$$

$$P_y = -\frac{\partial V}{\partial y} = -\frac{\partial[-(x^2 + y^2 + z^2)^{1/2}]}{\partial y} = y(x^2 + y^2 + z^2)^{-1/2} \quad ◀$$

$$P_z = -\frac{\partial V}{\partial z} = -\frac{\partial[-(x^2 + y^2 + z^2)^{1/2}]}{\partial z} = z(x^2 + y^2 + z^2)^{-1/2} \quad ◀$$

(*b*) $U_{OABD} = U_{OA} + U_{AB} + U_{BD}$

O–A: P_y and P_x are perpendicular to *O–A* and do no work.

Also, on *O–A* $\quad x = y = 0$ and $P_z = 1$

Thus, $\quad U_{O-A} = \int_0^a P_z dz = \int_0^a dz = a$

A–B: P_z and P_y are perpendicular to *A–B* and do no work.

Also, on *A–B* $\quad y = 0, \quad z = a$ and $P_x = \dfrac{x}{(x^2 + a^2)^{1/2}}$

Thus, $$U_{A-B} = \int_0^a \frac{x\,dx}{(x^2 + a^2)^{1/2}}$$
$$= a(\sqrt{2} - 1)$$

B–D: P_x and P_z are perpendicular to *B–D* and do no work.

On *B–D*, $\quad k = a$

$z = a$

$$P_y = \frac{y}{(y^2 + 2a^2)^{1/2}}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.83*

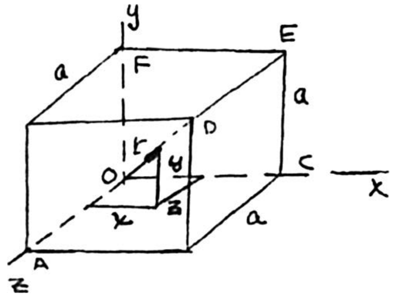
(a) Calculate the work done from D to O by the force $\mathbf{P}$ of Problem 13.82 by integrating along the diagonal of the cube. (b) Using the result obtained and the answer to part b of Problem 13.82, verify that the work done by a conservative force around the closed path $OABDO$ is zero.

PROBLEM 13.82 The potential function associated with a force $\mathbf{P}$ in space is known to be $V(x, y, z) = -(x^2 + y^2 + z^2)^{1/2}$. ($a$) Determine the x, y, and z components of $\mathbf{P}$. (b) Calculate the work done by $\mathbf{P}$ from O to D by integrating along the path $OABD$, and show that it is equal to the negative of the change in potential from O to D.

SOLUTION



From solution to (a) of Problem 13.82

$$\mathbf{P} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{1/2}}$$

(a) $\quad U_{OD} = \int_O^D \mathbf{P} \cdot d\mathbf{r}$

$$\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$$

$$d\mathbf{r} = dx\mathbf{i} + dy\mathbf{j} + dz\mathbf{k}$$

$$\mathbf{P} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{1/2}}$$

Along the diagonal. $\quad x = y = z$

Thus, $\quad \mathbf{P} \cdot dr = \dfrac{3x}{(3x^2)^{1/2}} = \sqrt{3}$

$$U_{O-D} = \int_0^a \sqrt{3}\, dx = \sqrt{3}a$$

$U_{OD} = \sqrt{3}a$ ◀

(b) $\quad U_{OABDO} = U_{OABD} + U_{DO}$

From Problem 13.82

$$U_{OABD} = \sqrt{3}a \quad \text{at left}$$

The work done from D to O along the diagonal is the negative of the work done from O to D.

$$U_{DO} = -U_{OD} = -\sqrt{3}a \qquad \text{[see part (}a\text{)]}$$

Thus,

$$U_{OABDO} = \sqrt{3}a - \sqrt{3}a = 0$$ ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.84*

The force $\mathbf{F} = (x\mathbf{i} + y\mathbf{j} + z\mathbf{k})/(x^2 + y^2 + z^2)^{3/2}$ acts on the particle $P(x, y, z)$ which moves in space. (*a*) Using the relations derived in Problem 13.79, prove that $\mathbf{F}$ is a conservative force. (*b*) Determine the potential function $V(x, y, z)$ associated with $\mathbf{F}$.

SOLUTION

(*a*)

$$F_x = \frac{x}{(x^2 + y^2 + z^2)^{3/2}}$$

$$F_y = \frac{y}{(x^2 + y^2 + z^2)^{1/2}}$$

$$\frac{\partial F_x}{\partial y} = \frac{x\left(-\frac{3}{2}\right)(2y)}{(x^2 + y^2 + z^2)^{5/2}}$$

$$\frac{\partial F_y}{\partial x} = \frac{y\left(-\frac{3}{2}\right)2y}{(x^2 + y^2 + z^2)^{5/2}}$$

Thus, $$\frac{\partial F_x}{\partial y} = \frac{\partial F_y}{\partial x}$$

The other two equations derived in Problem 13.79 are checked in a similar fashion.

(*b*) Recalling that $$F_x = -\frac{\partial V}{\partial x}, \quad F_y = -\frac{\partial V}{\partial y}, \quad F_z = -\frac{\partial V}{\partial z}$$

$$F_x = -\frac{\partial V}{\partial x} \quad V = -\int \frac{x}{(x^2 + y^2 + z^2)^{3/2}} dx$$

$$V = (x^2 + y^2 + z^2)^{-1/2} + f(y, z)$$

Similarly integrating $\partial V/\partial y$ and $\partial V/\partial z$ shows that the unknown function $f(x, y)$ is a constant.

$$V = \frac{1}{(x^2 + y^2 + z^2)^{1/2}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.85

(*a*) Determine the kinetic energy per unit mass which a missile must have after being fired from the surface of the earth if it is to to reach an infinite distance from the earth. (*b*) What is the initial velocity of the missile (called the *escape velocity*)? Give your answers in SI units and show that the answer to part *b* is independent of the firing angle.

SOLUTION

At the surface of the earth, $g = 9.81 \text{ m/s}^2$

$$r_1 = R = 6370 \text{ km} = 6.37 \times 10^6 \text{ m}$$

Centric force at the surface of the earth,

$$F = mg = \frac{GMm}{R^2}$$

$$GM = gR^2 = (9.81)(6.37 \times 10^6)^2 = 398.06 \times 10^{12} \text{ m}^3/\text{s}^2$$

Let position 1 be on the surface of the earth $(r_1 = R)$ and position 2 be at $r_2 = OD.$ Apply the conservation of energy principle.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_1^2 - \frac{GMm}{r_1} = \frac{1}{2}mv_2^2 + \frac{GMm}{r_2}$$

$$T_1 = T_2 + \frac{GMm}{R} - \frac{GMm}{\infty}$$

$$\frac{T_1}{m} = \frac{T_2}{m} + \frac{GM}{R} = \frac{T_2}{m} + gR$$

For the escape condition set $\frac{T_2}{m} = 0$

$$\frac{T_1}{m} = gR = (9.81 \text{ m/s}^2)(6.37 \times 10^6 \text{ m}) = 62.49 \times 10^6 \text{ m}^2/\text{s}^2$$

(*a*) $\frac{T_1}{m} = 62.5 \text{ MJ/kg}$ ◀

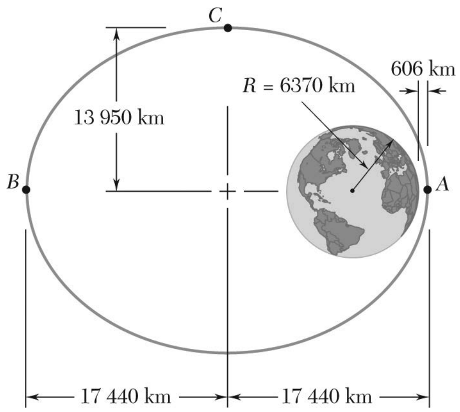
$$\frac{1}{2}mv_{\text{esc}}^2 = gr$$

$$v_{\text{esc}} = \sqrt{2gR}$$

(*b*) $v_{\text{esc}} = \sqrt{(2)(9.81)(6.37 \times 10^6)} = 11.18 \times 10^3 \text{ m/s}$ $v_{\text{esc}} = 11.18 \text{ km/s}$ ◀

Note that the escape condition depends only on the speed in position 1 and is independent of the direction of the velocity (firing angle).

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.86

A satellite describes an elliptic orbit of minimum altitude 606 km above the surface of the earth. The semimajor and semiminor axes are 17,440 km and 13,950 km, respectively. Knowing that the speed of the satellite at Point C is 4.78 km/s, determine (a) the speed at Point A, the perigee, (b) the speed at Point B, the apogee.

SOLUTION

$$r_A = 6370 + 606 = 6976 \text{ km} = 6.976\times 10^6 \text{ m}$$

$$r_C = \sqrt{(17440 - 6976)^2 + (13950)^2} = 17438.4 \text{ km} = 17.4384\times 10^6 \text{ m}$$

$$r_B = (2)(17440) - 6976 = 27904 \text{ km} = 27.904\times 10^6 \text{ m}$$

For earth,

$$R = 6370 \text{ km} = 6.37\times 10^6 \text{ m}$$

$$GM = gR^2 = (9.81 \text{ m/s}^2)(6.370\times 10^6)^2 = 398.06\times 10^{12} \text{ m}^3/\text{s}^2$$

$$v_C = 4.78 \text{ km/s} = 4780 \text{ m/s}$$

(a) *Speed at Point A*: Use conservation of energy.

$$T_A + V_A = T_C + V_C$$

$$\frac{1}{2}mv_A^2 - \frac{GMm}{r_A} = \frac{1}{2}mv_C^2 - \frac{GMm}{r_C}$$

$$v_A^2 = v_C^2 + 2GM\left(\frac{1}{r_A} - \frac{1}{r_C}\right)$$

$$= (4780)^2 + (2)(398.06\times 10^{12})\left[\frac{1}{6.976\times 10^6} - \frac{1}{17.4384\times 10^6}\right]$$

$$= 91.318\times 10^6 \text{ m}^2/\text{s}^2$$

$$V_A = 9.556\times 10^3 \text{ m/s}$$

$$v_A = 9.56 \text{ km/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

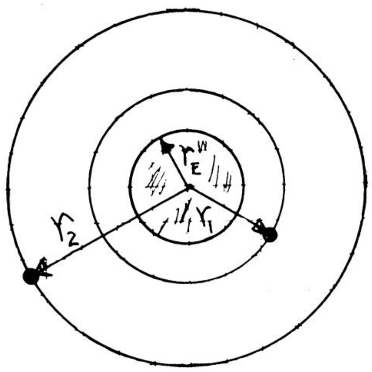
PROBLEM 13.87

While describing a circular orbit 200 mi above the earth a space vehicle launches a 6000-lb communications satellite. Determine (*a*) the additional energy required to place the satellite in a geosynchronous orbit at an altitude of 22,000 mi above the surface of the earth, (*b*) the energy required to place the satellite in the same orbit by launching it from the surface of the earth, excluding the energy needed to overcome air resistance. (A *geosynchronous orbit* is a circular orbit in which the satellite appears stationary with respect to the ground).

SOLUTION



Geosynchronous orbit

$$r_1 = 3960 + 200 = 4160 \text{ mi} = 21.965 \times 10^6 \text{ ft}$$

$$r_2 = 3960 + 22{,}000 = 25{,}960 \text{ mi} = 137.07 \times 10^6 \text{ ft}$$

Total energy $\quad E = T + V = \frac{1}{2}mv^2 - \frac{GMm}{r}$

$$M = \text{mass of earth}$$

$$m = \text{mass of satellite}$$

Newton's second law $\quad F = ma_n: \quad \frac{GMm}{r^2} = \frac{mv^2}{r} \Rightarrow v^2 = \frac{GM}{r}$

$$T = \frac{1}{2}mv^2 = m\frac{GM}{2r} \qquad V = -\frac{GMm}{r}$$

$$E = T + V = \frac{1}{2}\frac{GMm}{r} - \frac{GMm}{r} = -\frac{1}{2}\frac{GMm}{r}$$

$$GM = gR_E^2 \qquad E = -\frac{1}{2}\frac{gR_E^2 m}{r} = -\frac{1}{2}\frac{R_E^2 W}{r} \text{ where } (W = mg)$$

$$E = -\frac{1}{2}\frac{(6000)(20.9088 \times 10^6 \text{ ft})^2}{r} = -\frac{1.3115 \times 10^{18}}{r} \text{ ft} \cdot \text{lb}$$

Geosynchronous orbit at $r_2 = 137.07 \times 10^6$ ft

$$E_{Gs} = \frac{-1.3115 \times 10^{18}}{137.07 \times 10^6} = -9.5681 \times 10^9 \text{ ft} \cdot \text{lb}$$

(*a*) At 200 mi, $\quad r_1 = 21.965 \times 10^6$ ft

$$E_{200} = -\frac{1.3115 \times 10^{18}}{21.965 \times 10^6} = -5.9709 \times 10^{10}$$

$$\Delta E_{300} = E_{Gs} - E_{200} = 5.0141 \times 10^{10}$$

$$\Delta E_{300} = 50.1 \times 10^9 \text{ ft} \cdot \text{lb} \blacktriangleleft$$

PROBLEM 13.88

A lunar excursion module (LEM) was used in the Apollo moon-landing missions to save fuel by making it unnecessary to launch the entire Apollo spacecraft from the moon's surface on its return trip to earth. Check the effectiveness of this approach by computing the energy per pound required for a spacecraft (as weighed on the earth) to escape the moon's gravitational field if the spacecraft starts from (*a*) the moon's surface, (*b*) a circular orbit 50 mi above the moon's surface. Neglect the effect of the earth's gravitational field. (The radius of the moon is 1081 mi and its mass is 0.0123 times the mass of the earth.)

SOLUTION

Note: $GM_{\text{moon}} = 0.0123\, GM_{\text{earth}}$

By Eq. 12.30, $GM_{\text{moon}} = 0.0123\, gR_E^2$

At ∞ distance from moon: $r_2 = \infty$, Assume $v_2 = 0$

$$\begin{aligned} E_2 &= T_2 + V_2 \\ &= 0 - \frac{GM_M m}{\infty} \\ &= 0 - 0 \\ &= 0 \end{aligned}$$

(*a*) On surface of moon: $R_M = 1081 \text{ mi} = 5.7077\times10^6 \text{ ft}$

$v_1 = 0 \quad T_1 = 0$ $\qquad R_E = 3960 \text{ mi} = 20.909\times10^6 \text{ ft}$

$V_1 = -\dfrac{GM_M m}{R_M}$ $\qquad E_1 = T_1 + V_1 = 0 - \dfrac{0.0123\, gR_E^2 m}{R_M}$

$$E_1 = -\frac{(0.0123)(32.2 \text{ ft/s}^2)(20.909\times10^6 \text{ ft})^2 m}{(5.7077\times10^6 \text{ ft})}$$

W_E = Weight of LEM on the earth

$$E_1 = (-30.336\times10^6 \text{ ft}^2/\text{s}^2)m \qquad m = \frac{W_E}{g}$$

$$E_1 = \left(-\frac{30.336\times10^6}{32.2 \text{ ft/s}^2}\text{ft}^2/\text{s}^2\right)W_E$$

$$\begin{aligned} \Delta E &= E_2 - E_1 \\ &= 0 + (942.1\times10^3 \text{ ft}\cdot\text{lb/lb})W_E \end{aligned}$$

Energy per pound: $\dfrac{\Delta E}{W_E} = 942\times10^3 \text{ ft}\cdot\text{lb/lb}$ ◀

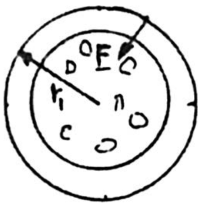
PROBLEM 13.88 (Continued)

(*b*) $r_1 = R_M + 50 \text{ mi}$



$r_1 = (1081 \text{ mi} + 50 \text{ mi}) = 1131 \text{ mi} = 5.9717 \times 10^6 \text{ ft}$

Newton's second law:

$$F = ma_n: \quad \frac{GM_M m}{r_1^2} = m\frac{v_1^2}{r_1}$$

$$v_1^2 = \frac{GMm}{r_1} \qquad T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}m\frac{GM_M}{r_1}$$

$$V_1 = -\frac{GM_M m}{r_1}$$

$$E_1 = T_1 + V_1 = \frac{1}{2}\frac{GM_M m}{r_1} - \frac{GM_M m}{r_1}$$

$$E_1 = -\frac{1}{2}\frac{GM_M m}{r_1} = -\frac{1}{2}\frac{0.0123\, gR_E^2 m}{r_1}$$

$$E_1 = -\frac{1}{2}\frac{(0.0123)(32.2 \text{ ft/s}^2)(20.909 \times 10^6 \text{ ft})^2 m}{5.9717 \times 10^6 \text{ ft}}$$

$$E_1 = \frac{(14.498 \times 10^6 \text{ ft}^2/\text{s}^2) W_E}{(32.2 \text{ ft/s}^2)} = 450.2 \times 10^3 \text{ ft} \cdot \text{lb/lb}\, W_E$$

$$\Delta E = E_2 - E_1 = 0 + 450.2 \times 10^3 \text{ ft} \cdot \text{lb/lb}\, W_E$$

Energy per pound: $\dfrac{\Delta E}{W_E} = 450 \times 10^3 \text{ ft} \cdot \text{lb/lb}$ ◀

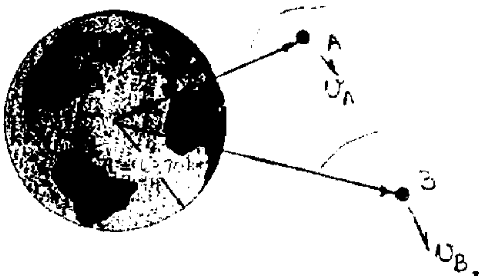
PROBLEM 13.89

Knowing that the velocity of an experimental space probe fired from the earth has a magnitude $v_A = 32.5$ Mm/h at Point A, determine the speed of the probe as it passes through Point B.

SOLUTION



$$r_A = R + h_A = 6370 + 4300 = 10740 \text{ km} = 10.670\times10^6 \text{ m}$$

$$r_B = 6370 + 12700 = 19070 \text{ km} = 19.070\times10^6 \text{ m}$$

$$GM = gR^2 = (9.81)(6.370\times10^6)^2 = 398.06\times10^{12} \text{ m}^3/\text{s}^2$$

$$v_A = 32.5 \text{ Mm/h} = 9.0278\times10^3 \text{ m/s}$$

Use conservation of energy.

$$T_B + V_B = T_A + V_A$$

$$\frac{1}{2}mv_B^2 - \frac{GMm}{r_B} = \frac{1}{2}mv_A^2 - \frac{GMm}{r_A}$$

$$v_B^2 = v_A^2 + 2GM\left(\frac{1}{r_B} - \frac{1}{r_A}\right)$$

$$= (9.0278\times10^3)^2 + (2)(398.06\times10^{12})\left[\frac{1}{19.070\times10^6} - \frac{1}{10.670\times10^6}\right]$$

$$= 48.635\times10^6 \text{ m}^2/\text{s}^2$$

$$v_B = 6.97\times10^3 \text{ m/s} \qquad v_B = 25.1 \text{ Mm/h} ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.90

A spacecraft is describing a circular orbit at an altitude of 1500 km above the surface of the earth. As it passes through Point A, its speed is reduced by 40 percent and it enters an elliptic crash trajectory with the apogee at Point A. Neglecting air resistance, determine the speed of the spacecraft when it reaches the earth's surface at Point B.

SOLUTION

Circular orbit velocity

$$\frac{v_C^2}{r} = \frac{GM}{r^2}, \; GM = gR^2$$

$$v_C^2 = \frac{GM}{r} = \frac{gR^2}{r} = \frac{(9.81\text{ m/s}^2)(6.370\times 10^6\text{ m})^2}{(6.370\times 10^6\text{ m} + 1.500\times 10^6\text{ m})}$$

$$v_C^2 = 50.579\times 10^6\text{ m}^2/\text{s}^2$$

$$v_C = 7112\text{ m/s}$$

Velocity reduced to 60% of v_C gives $v_A = 4267$ m/s.

Conservation of energy:

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}\cancel{m}v_A^2 - \frac{GM\cancel{m}}{r_A} = \frac{1}{2}\cancel{m}v_B^2 - \frac{GM\cancel{m}}{r_B}$$

$$\frac{1}{2}(4.267\times 10^3)^2 - \frac{9.81(6.370\times 10^6)^2}{(7.870\times 10^6)} = \frac{v_B^2}{2} - \frac{9.81(6.370\times 10^6)^2}{(6.370\times 10^6)}$$

$$v_B = 6.48\times 10^3\text{ m/s} \qquad v_B = 6.48\text{ km/s} \blacktriangleleft$$

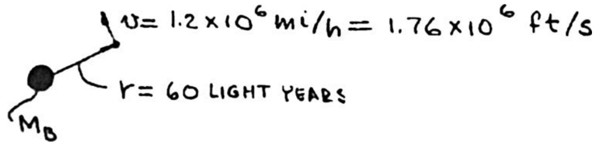
PROBLEM 13.91

Observations show that a celestial body traveling at 1.2×10^6 mi/h appears to be describing about Point B a circle of radius equal to 60 light years. Point B is suspected of being a very dense concentration of mass called a black hole. Determine the ratio M_B/M_S of the mass at B to the mass of the sun. (The mass of the sun is 330,000 times the mass of the earth, and a light year is the distance traveled by light in one year at a velocity of 186,300 mi/s.)

SOLUTION



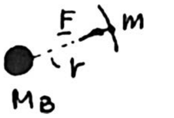
One light year is the distance traveled by light in one year.

Speed of light = 186,300 mi/s

$$r = (60\text{ yr})(186{,}300\text{ mi/s})(5280\text{ ft/mi})(365\text{ days/yr})(24\text{ h/day})(3600\text{ s/h})$$

$$r = 1.8612\times10^{18}\text{ ft}$$

Newton's second law



$$F = \frac{GM_B m}{r^2} = m\frac{v^2}{r}$$

$$M_B = \frac{rv^2}{G}$$

$$GM_{\text{earth}} = gR_{\text{earth}}^2$$

$$= (32.2\text{ ft/s}^2)(3960\text{ mi}\times5280\text{ ft/mi})^2$$

$$= 14.077\times10^{15}(\text{ft}^3/\text{s}^2)$$

$$M_{\text{sun}} = 330{,}000M_E:\quad GM_{\text{sun}} = 330{,}000\,GM_{\text{earth}}$$

$$GM_{\text{sun}} = (330{,}000)(14.077\times10^{15})$$

$$= 4.645\times10^{21}\text{ ft}^3/\text{s}^2$$

$$G = \frac{4.645\times10^{21}}{M_{\text{sun}}}$$

$$M_B = \frac{rv^2}{G} = \frac{rv^2M_{\text{sun}}}{4.645\times10^{21}}$$

$$\frac{M_B}{M_{\text{sun}}} = \frac{(1.8612\times10^{18})(1.76\times10^6)^2}{4.645\times10^{21}}\qquad \frac{M_B}{M_{\text{sun}}} = 1.241\times10^9 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.92

(*a*) Show that, by setting $r = R + y$ in the right-hand member of Eq. (13.17′) and expanding that member in a power series in *y/R*, the expression in Eq. (13.16) for the potential energy V_g due to gravity is a first-order approximation for the expression given in Eq. (13.17′). (*b*) Using the same expansion, derive a second-order approximation for V_g.

SOLUTION

$$V_g = -\frac{WR^2}{r} \quad \text{setting } r = R + y: \quad V_g = -\frac{WR^2}{R+y} = -\frac{WR}{1+\frac{y}{R}}$$

$$V_g = -WR\left(1+\frac{y}{R}\right)^{-1} = -WR\left[1+\frac{(-1)}{1}\frac{y}{R}+\frac{(-1)(-2)}{1\cdot 2}\left(\frac{y}{R}\right)^2+\cdots\right]$$

We add the constant *WR*, which is equivalent to changing the datum from $r = \infty$ to $r = R$:

$$V_g = WR\left[\frac{y}{R}-\left(\frac{y}{R}\right)^2+\cdots\right]$$

(*a*) First order approximation:

$$V_g = WR\left(\frac{y}{R}\right) = Wy \quad \blacktriangleleft$$

[Equation 13.16]

(*b*) Second order approximation: $$V_g = WR\left[\frac{y}{R}-\left(\frac{y}{R}\right)^2\right]$$

$$V_g = Wy - \frac{Wy^2}{R} \quad \blacktriangleleft$$

PROBLEM 13.93

Collar A has a mass of 3 kg and is attached to a spring of constant 1200 N/m and of undeformed length equal to 0.5 m. The system is set in motion with r = 0.3 m, v_θ= 2 m/s, and v_r = 0. Neglecting the mass of the rod and the effect of friction, determine the radial and transverse components of the velocity of the collar when r = 0.6 m.

SOLUTION

Let position 1 be the initial position.

$$r_1 = 0.3 \text{ m}$$

$$(v_r)_1 = 0, \qquad (v_\theta)_1 = 2 \text{ m/s}, \qquad v_1 = 2 \text{ m/s}$$

$$x_1 = r_1 - l_0 = (0.3 - 0.5) = -0.2 \text{ m}$$

Let position 2 be when $r = 0.6$ m.

$$r_2 = 0.6 \text{ m}$$

$$(v_r)_2 = ?, \qquad (v_\theta)_2 = ?, \qquad v_2 = ?$$

$$x_2 = r_2 - l_0 = (0.6 - 0.5) = 0.1 \text{ m}$$

Conservation of angular momentum: $\quad r_1 m(v_\theta)_1 = v_2 m(v_\theta)_2$

$$(v_\theta)_2 = \frac{r_1(v_\theta)_1}{r_2} = \frac{(0.3)(2)}{0.6} = 1.000 \text{ m/s}$$

Conservation of energy: $\quad T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2}mv_1^2 + \frac{1}{2}kx_1^2 = \frac{1}{2}mv_2^2 + \frac{1}{2}kx_2^2$$

$$v_2^2 = v_1^2 + \frac{k}{m}\left(x_1^2 - x_2^2\right)$$

$$= (2)^2 + \frac{1200}{3}\left[(0.2)^2 - (0.1)^2\right] = 16 \text{ m}^2/\text{s}^2$$

$$(v_r)_2^2 = v_2^2 - (v_\theta)^2 = 16 - 1 = 15 \text{ m}^2/\text{s}^2$$

$$v_r = \pm 3.87 \text{ m/s}$$

$v_r = \pm 3.87$ m/s ◀

$v_\theta = 1.000$ m/s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.94

Collar A has a mass of 3 kg and is attached to a spring of constant 1200 N/m and of undeformed length equal to 0.5 m. The system is set in motion with $r = 0.3$ m, $v_\theta = 2$ m/s, and $v_r = 0$. Neglecting the mass of the rod and the effect of friction, determine (*a*) the maximum distance between the origin and the collar, (*b*) the corresponding speed. (*Hint:* Solve the equation obtained for r by trial and error.)

SOLUTION

Let position 1 be the initial position.

$$r_1 = 0.3 \text{ m}$$

$$(v_r)_1 = 0, \qquad (v_\theta)_1 = 2 \text{ m/s}, \qquad v_1 = 2 \text{ m/s}$$

$$x_1 = r_1 - l_0 = 0.3 - 0.5 = -0.2 \text{ m}$$

$$T_1 = \frac{1}{2}mv^2 = \frac{1}{2}(3)(2)^2 = 6 \text{ J}$$

$$V_1 = \frac{1}{2}kx_1^2 = \frac{1}{2}(1200)(-0.2)^2 = 24 \text{ J}$$

Let position 2 be when r is maximum. $(v_r)_2 = 0$

$$r_2 = r_m$$

$$x_2 = (r_m - 0.5)$$

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(3)(v_\theta)_2^2 = 1.5(v_\theta)_2^2$$

$$V_2 = \frac{1}{2}kx_2^2 = \frac{1}{2}(1200)(r_m - 0.5)^2$$

$$= 600(r_m - 0.5)^2$$

Conservation of angular momentum: $\quad r_1 m(v_\theta)_1 = v_2 m(v_\theta)_2$

$$(v_\theta)_2 = \frac{r_1}{r_2}(v_\theta)_1 = \frac{(0.3)}{r_m}(2) = \frac{0.6}{r_m}$$

Conservation of energy: $\quad T_1 + V_1 = T_2 + V_2$

$$6 + 24 = 1.5(v_\theta)_2^2 + 600(r_m - 0.5)^2$$

$$30 = (1.5)\left(\frac{0.6}{r_m}\right)^2 + 600(r_m - 0.5)^2$$

$$f(r_m) = \frac{0.54}{r_m^2} + 600(r_m - 0.5)^2 - 30 = 0$$

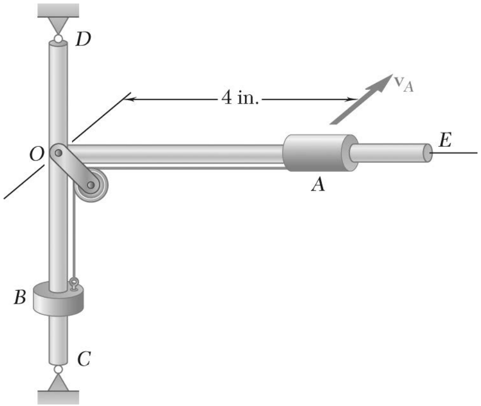
PROBLEM 13.95



A 4-lb collar *A* and a 1.5-lb collar *B* can slide without friction on a frame, consisting of the horizontal rod *OE* and the vertical rod *CD*, which is free to rotate about *CD*. The two collars are connected by a cord running over a pulley that is attached to the frame at *O*. At the instant shown, the velocity $\mathbf{v}_A$ of collar *A* has a magnitude of 6 ft/s and a stop prevents collar *B* from moving. If the stop is suddenly removed, determine (*a*) the velocity of collar *A* when it is 8 in. from *O*, (*b*) the velocity of collar *A* when collar *B* comes to rest. (Assume that collar *B* does not hit *O*, that collar *A* does not come off rod *OE*, and that the mass of the frame is negligible.)

SOLUTION

Masses:
$$m_A = \frac{4}{32.2} = 0.12422 \text{ lb}\cdot\text{s}^2/\text{ft}$$
$$m_B = \frac{1.5}{32.2} = 0.04658 \text{ lb}\cdot\text{s}^2/\text{ft}$$

Constraint of the cord. Let *r* be the radial distance to the center of collar *A* and *y* be the distance that collar *B* moves up from its initial level. $y = \Delta r;\quad \dot{y} = v_r$

(*a*) Let position 1 be the initial position just after the stop at *B* is removed and position 2 be when the collar is 8 in. (0.66667 ft) from *O*.

$$r_1 = 4 \text{ in.} = 0.33333 \text{ ft} \qquad (v_r)_1 = 0$$
$$r_2 = 8 \text{ in.} = 0.66667 \text{ ft}$$
$$\Delta r = y_2 = 8 - 4 = 4 \text{ in.} = 0.33333 \text{ ft}$$

Potential energy: $V_1 = 0,$

$$V_2 = W_B y_2 = (1.5)(0.33333) = 0.5 \text{ ft}\cdot\text{lb}$$

Conservation of angular momentum of collar *A*:

$$m_A r_1 (v_\theta)_1 = m_A r_2 (v_\theta)_2$$
$$(v_\theta)_2 = \frac{r_1 (v_\theta)_1}{r_2} = \frac{(0.33333)(6)}{0.66667} = 3 \text{ ft/s}$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2} m_A [(v_r)_1^2 + (v_\theta)_1^2] + \frac{1}{2} m_B \dot{y}_1^2 = \frac{1}{2} m_A [(v_r)_2^2 + (v_\theta)_2^2] + \frac{1}{2} m_B \dot{y}^2 + V_2$$

$$\frac{1}{2} m_A [0 + (v_\theta)_1^2] + 0 + 0 = \frac{1}{2} m_A [(v_r)_2^2 + (v_\theta)_2^2] + \frac{1}{2} m_B (v_r)_2^2 + 0.5$$

PROBLEM 13.96

A 1.5-lb ball that can slide on a *horizontal* frictionless surface is attached to a fixed Point O by means of an elastic cord of constant $k = 1$ lb/in. and undeformed length 2 ft. The ball is placed at Point A, 3 ft from O, and given an initial velocity $\mathbf{v}_0$ perpendicular to OA. Determine (a) the smallest allowable value of the initial speed v_0 if the cord is not to become slack, (b) the closest distance d that the ball will come to Point O if it is given half the initial speed found in part a.

SOLUTION

Let L_1 be the initial stretched length of the cord and L_2 the length of the closest approach to Point O if the cord does not become slack. Let position 1 be the initial state and position 2 be that of closest approach to Point O. The only horizontal force acting on the ball is the conservative central force due to the elastic cord. At the point of closest approach the velocity of the ball is perpendicular to the cord.

Conservation of angular momentum:
$$r_1 m v_1 = r_2 m v_2$$
$$L_1 m v_0 = L_2 m v_2 \quad \text{or} \quad v_2 = \frac{L_1 v_0}{L_2}$$

Conservation of energy:
$$T_1 + V_1 = T_2 + V_2$$
$$\frac{1}{2} m v_1^2 + \frac{1}{2} k (L_1 - L_0)^2 = \frac{1}{2} m v_2^2 + \frac{1}{2} k (L_2 - L_0)^2$$
$$v_1^2 - v_2^2 = -\frac{k}{m}[(L_1 - L_0)^2 + (L_2 - L_0)^2]$$
$$v_0^2 - \frac{L_1^2}{L_2^2} v_0^2 = -\frac{k}{m}[(L_1 - L_0)^2 + (L_2 - L_0)^2]$$

Data:
$$L_0 = 2 \text{ ft}, \quad L_1 = 3 \text{ ft}$$

$L_2 = L_0 = 2$ ft for zero tension in the cord at the point of closest approach.

$$k = 1 \text{ lb/in.} = 12 \text{ lb/ft}$$
$$m = W/g = 1.5/32.2 = 0.04658 \text{ lb} \cdot \text{s}^2/\text{ft}$$
$$v_0^2 - \frac{(3)^2}{(2)^2} v_0 = -\frac{12}{0.04658}[(3-2)^2 + (2-2)^2]$$
$$-1.25\, v_0^2 = -257.6$$

(a) $\quad v_0^2 = 206.1 \text{ ft}^2/\text{s}^2 \qquad v_0 = 14.36$ ft/s ◀

PROBLEM 13.97

A 1.5-lb ball that can slide on a *horizontal* frictionless surface is attached to a fixed Point *O* by means of an elastic cord of constant $k = 1$ lb/in. and undeformed length 2 ft. The ball is placed at Point *A*, 3 ft from *O*, and given an initial velocity $\mathbf{v}_0$ perpendicular to *OA*, allowing the ball to come within a distance $d = 9$ in. of Point *O* after the cord has become slack. Determine (*a*) the initial speed v_0 of the ball, (*b*) its maximum speed.

SOLUTION

Let L_1 be the initial stretched length of the cord. Let position 1 be the initial position. Let position 2 be the position of closest approach to point after the cord has become slack. While the cord is slack there are no horizontal forces acting on the ball, so the velocity remains constant. While the cord is stretched, the only horizontal force acting on the ball is the conservative central force due to the elastic cord. At the point of closest approach the velocity of the ball is perpendicular to the radius vector.

Conservation of angular momentum: $r_1 m v_1 = r_2 m v_2$

$$L_1 v_0 = d\, v_2 \qquad \text{or} \qquad v_2 = \frac{L_1}{d} v_0$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2} m v_0^2 + \frac{1}{2} k (L_1 - L_0)^2 = \frac{1}{2} m v_2^2 + 0$$

$$v_0^2 - v_2^2 = -\frac{k}{m}(L_1 - L_0)^2$$

$$v_0^2 - \left(\frac{L_1}{d^2} v_0\right)^2 = -\frac{k}{m}(L_1 - L_0)$$

Data: $L_0 = 2$ ft, $L_1 = 3$ ft, $d = 9$ in. $= 0.75$ ft

$k = 1$ lb/in. $= 12$ lb/ft

$m = W/g = 1.5/32.2 = 0.04658$ lb $\cdot$ s^2/ft

$$v_0^2 - \left(\frac{3\, v_0}{0.75}\right)^2 = -\frac{12}{0.04658}(3-2)^2$$

$$-15 v_0^2 = -257.6$$

(*a*) $v_0^2 = 17.17$ ft^2/s^2 $\qquad v_0 = 4.14$ ft/s ◀

(*b*) Maximum speed. $v_m = v_2 = \dfrac{3 v_0}{0.75}$ $\qquad v_m = 16.58$ ft/s ◀

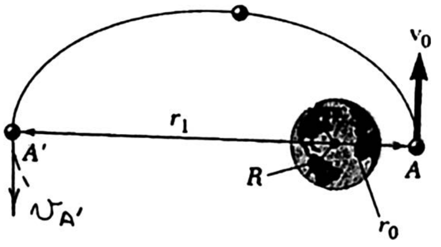
PROBLEM 13.98

Using the principles of conservation of energy and conservation of angular momentum, solve part *a* of Sample Problem 12.9.

SOLUTION



$$R = 6370 \text{ km}$$
$$r_0 = 500 \text{ km} + 6370 \text{ km}$$
$$r_0 = 6870 \text{ km} = 6.87\times10^6 \text{ m}$$
$$v_0 = 36{,}900 \text{ km/h}$$
$$= \frac{36.9\times10^6 \text{ m}}{3.6\times10^3 \text{ s}}$$
$$= 10.25\times10^3 \text{ m/s}$$

Conservation of angular momentum:

$$r_0 m v_0 = r_1 m v_A, \qquad r_0 = r_{\min}, \; r_1 = r_{\max}$$
$$v_{A'} = \left(\frac{r_0}{r_1}\right) v_0 = \left(\frac{6.870\times10^6}{r_1}\right)(10.25\times10^3)$$
$$v_{A'} = \frac{70.418\times10^9}{r_1} \qquad (1)$$

Conservation of energy:

Point A:

$$v_0 = 10.25\times10^3 \text{ m/s}$$
$$T_A = \frac{1}{2} m v_0^2 = \frac{1}{2} m (10.25\times10^3)^2$$
$$T_A = (m)(52.53\times10^6)(\text{J})$$
$$V_A = -\frac{GMm}{r_0}$$
$$GM = gR^2 = (9.81 \text{ m/s}^2)(6.37\times10^6 \text{ m})^2$$
$$GM = 398\times10^{12} \text{ m}^3/\text{s}^2$$
$$r_0 = 6.87\times10^6 \text{ m}$$
$$V_A = -\frac{(398\times10^{12} \text{ m}^3/\text{s}^2)m}{(6.87\times10^6 \text{ m})}$$
$$= -57.93\times10^6 \, m \text{ (J)}$$

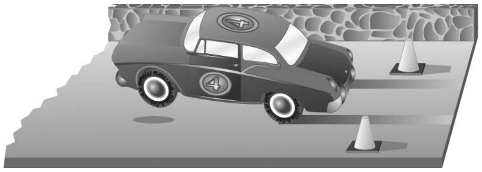
PROBLEM 13.99

Solve sample Problem 13.8, assuming that the elastic cord is replaced by a central force **F** of magnitude $(80/r^2)$ N directed toward O.



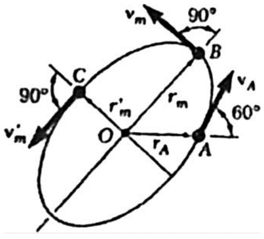
PROBLEM 13.8 Skid marks on a drag racetrack indicate that the rear (drive) wheels of a car slip for the first 20 m of the 400-m track.(*a*) Knowing that the coefficient of kinetic friction is 0.60, determine the speed of the car at the end of the first 20-m portion of the track if it starts from rest and the front wheels are just off the ground. (*b*) What is the maximum theoretical speed for the car at the finish line if, after skidding for 20 m, it is driven without the wheels slipping for the remainder of the race? Assume that while the car is rolling without slipping, 60 percent of the weight of the car is on the rear wheels and the coefficient of static friction is 0.75. Ignore air resistance and rolling resistance.

SOLUTION

(*a*) The force exerted on the sphere passes through O. Angular momentum about O is conserved.

Minimum velocity is at B, where the distance from O is maximum.

Maximum velocity is at C, where distance from O is minimum.



$$r_A m v_A \sin 60° = r_m m v_m$$

$$(0.5 \text{ m})(0.6 \text{ kg})(20 \text{ m/s}) \sin 60° = r_m (0.6 \text{ kg}) v_m$$

$$v_m = \frac{8.66}{r_m} \qquad (1)$$

Conservation of energy:

At Point A,

$$T_A = \frac{1}{2} m v_A^2 = \frac{1}{2}(0.6 \text{ kg})(20 \text{ m/s})^2 = 120 \text{ J}$$

$$V = \int F dr = \int \frac{80}{r^2} dr = \frac{-80}{r},$$

$$V_A = \frac{-80}{0.5} = -160 \text{ J}$$

At Point B,

$$T_B = \frac{1}{2} m v_m^2 = \frac{1}{2}(0.6 \text{ kg}) v_m^2 = 0.3 v_m^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.100

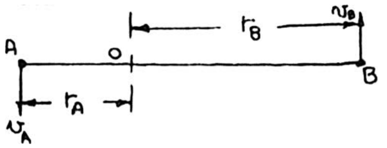
A spacecraft is describing an elliptic orbit of minimum altitude $h_A = 2400$ km and maximum altitude $h_B = 9600$ km above the surface of the earth. Determine the speed of the spacecraft at A.

SOLUTION



$$r_A = 6370 \text{ km} + 2400 \text{ km}$$
$$r_A = 8770 \text{ km}$$
$$r_B = 6370 \text{ km} + 9600 \text{ km}$$
$$= 15,970 \text{ km}$$

Conservation of momentum: $r_A m v_A = r_B m v_B$

$$v_B = \frac{r_A}{r_B} v_A = \frac{8770}{15,970} v_A = 0.5492 v_A \quad (1)$$

Conservation of energy: $T_A = \frac{1}{2} m v_A^2 \quad V_A = \frac{-GMm}{r_A} \quad T_B = \frac{1}{2} m v_B^2 \quad V_B = \frac{-GMm}{r_B}$

$$GM = gR^2 = (9.81 \text{ m/s}^2)(6370 \times 10^3 \text{ m})^2 = 398.1 \times 10^{12} \text{ m}^3/\text{s}^2$$

$$V_A = \frac{-(398.1 \times 10^{12})\,m}{8770 \times 10^3} = -45.39 \times 10^6 \, m$$

$$V_B = \frac{-(398.1 \times 10^{12})\,m}{(15,970 \times 10^3)} = -24.93 \, m$$

$$T_A + V_A = T_B + V_B:$$

$$\frac{1}{2} \not{m} v_A^2 - 45.39 \times 10^6 \not{m} = \frac{1}{2} \not{m} v_B^2 - 24.93 \times 10^6 \, m \quad (2)$$

Substituting for v_B in (2) from (1)

$$v_A^2 [1 - (0.5492)^2] = 40.92 \times 10^6$$
$$v_A^2 = 58.59 \times 10^6 \text{ m}^2/\text{s}^2$$
$$v_A = 7.65 \times 10^3 \text{ m/s}$$

$v_A = 27.6 \times 10^3$ km/h ◀

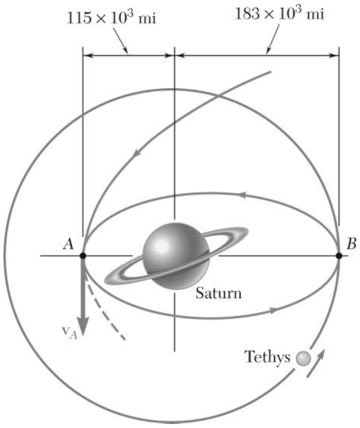
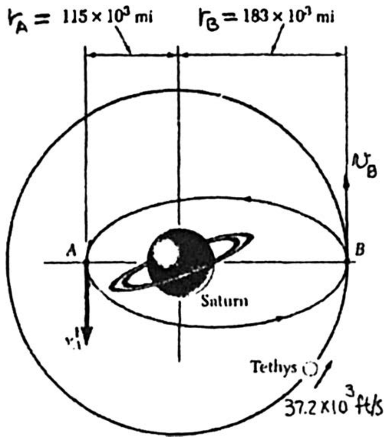
PROBLEM 13.102



A spacecraft approaching the planet Saturn reaches Point A with a velocity $\mathbf{v}_A$ of magnitude 68.8×10^3 ft/s. It is to be placed in an elliptic orbit about Saturn so that it will be able to periodically examine Tethys, one of Saturn's moons. Tethys is in a circular orbit of radius 183×10^3 mi about the center of Saturn, traveling at a speed of 37.2×10^3 ft/s. Determine (*a*) the decrease in speed required by the spacecraft at A to achieve the desired orbit, (*b*) the speed of the spacecraft when it reaches the orbit of Tethys at B.

SOLUTION



(*a*)

$$r_A = 607.2\times10^6 \text{ ft}$$
$$r_B = 966.2\times10^6 \text{ ft}$$

$v'_A =$ speed of spacecraft in the elliptical orbit after its speed has been decreased.

Elliptical orbit between A and B.

Conservation of energy

Point A: $$T_A = \frac{1}{2}mv'^2_A$$

$$V_A = \frac{-GM_{\text{sat}}m}{r_A}$$

$M_{\text{sa}} =$ Mass of Saturn, determine GM_{sa} from the speed of Tethys in its circular orbit.

(Eq. 12.44) $$v_{\text{circ}} = \sqrt{\frac{GM_{\text{sat}}}{r}} \quad GM_{\text{sat}} = r_B v_{\text{circ}}^2$$

$$GM_{\text{sat}} = (966.2\times10^6 \text{ ft}^2)(37.2\times10^3 \text{ ft/s})^2$$
$$= 1.337\times10^{18} \text{ ft}^3/\text{s}^2$$
$$V_A = -\frac{(1.337\times10^{18} \text{ ft}^3/\text{s}^2)\, m}{(607.2\times10^6 \text{ ft})}$$
$$= -2.202\times10^9\, m$$

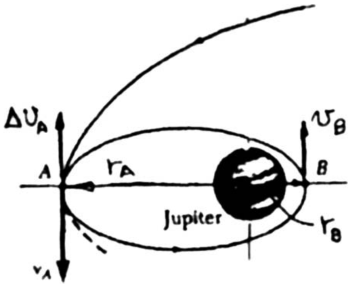
PROBLEM 13.103

A spacecraft traveling along a parabolic path toward the planet Jupiter is expected to reach Point A with a velocity $\mathbf{v}_A$ of magnitude 26.9 km/s. Its engines will then be fired to slow it down, placing it into an elliptic orbit which will bring it to within 100×10^3 km of Jupiter. Determine the decrease in speed Δv at Point A which will place the spacecraft into the required orbit. The mass of Jupiter is 319 times the mass of the earth.

SOLUTION

Conservation of energy.

Point A:



$$T_A = \frac{1}{2}m(v_A - \Delta v_A)^2$$

$$V_A = \frac{-GM_J m}{r_A}$$

$$GM_J = 319 GM_E = 319 g R_E^2$$

$$R_E = 6.37 \times 10^6 \text{ m}$$

$$GM_J = (319)(9.81 \text{ m/s}^2)(6.37 \times 10^6 \text{ m})^2$$

$$GM_J = 126.98 \times 10^{15} \text{ m}^3/\text{s}^2$$

$$r_A = 350 \times 10^6 \text{ m}$$

$$V_A = \frac{-(126.98 \times 10^{15} \text{ m}^3/\text{s}^2)m}{(350 \times 10^6 \text{ m})}$$

$$V_A = -(362.8 \times 10^6)m$$

Point B:

$$T_B = \frac{1}{2}mv_B^2$$

$$V_B = \frac{-GM_J m}{r_B} = \frac{-(126.98 \times 10^{15} \text{ m}^3/\text{s}^2)m}{(100 \times 10^6 m)}$$

$$V_B = -(1269.8 \times 10^6)m$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}m(v_A - \Delta v_A)^2 - 362.8 \times 10^6 m = \frac{1}{2}mv_B^2 - 1269.8 \times 10^6 \text{m}$$

$$(v_A - \Delta v_A)^2 - v_B^2 = -1814 \times 10^6 \quad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.103 (Continued)

Conservation of angular momentum.

$$r_A = 350 \times 10^6 \text{ m}$$

$$r_B = 100 \times 10^6 \text{ m}$$

$$r_A m(v_A - \Delta v_A) = r_B m v_B$$

$$v_B = \left(\frac{r_A}{r_B}\right)(v_A - \Delta v_A)$$

$$= \left(\frac{350}{100}\right)(v_A - \Delta v_A) \qquad (2)$$

Substitute v_B in (2) into (1)

$$(v_A - \Delta v_A)^2[1 - (3.5)^2] = -1814 \times 10^6$$

$$(v_A - \Delta v_A)^2 = 161.24 \times 10^6$$

$$(v_A - \Delta v_A) = \mp 12.698 \times 10^3 \text{ m/s}$$

(Take positive root; negative root reverses flight direction.)

$$v_A = 26.9 \times 10^3 \text{ m/s} \qquad \text{(given)}$$

$$\Delta v_A = (26.9 \times 10^3 \text{ m/s} - 12.698 \times 10^3 \text{ m/s})$$

$$\Delta v_A = 14.20 \text{ km/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.104

As a first approximation to the analysis of a space flight from the earth to Mars, it is assumed that the orbits of the earth and Mars are circular and coplanar. The mean distances from the sun to the earth and to Mars are 149.6×10^6 km and 227.8×10^6 km, respectively. To place the spacecraft into an elliptical transfer orbit at Point *A*, its speed is increased over a short interval of time to v_A which is faster than the earth's orbital speed. When the spacecraft reaches Point *B* on the elliptical transfer orbit, its speed v_B is increased to the orbital speed of Mars. Knowing that the mass of the sun is 332.8×10^3 times the mass of the earth, determine the increase in velocity required (*a*) at *A*, (*b*) at *B*.

SOLUTION

M = mass of the sun

$$GM = 332.8(10)^3(9.81\text{ m/s}^2)(6.37\times 10^6\text{ m})^2 = 1.3247(10)^{20}\text{ m}^3/\text{s}^2$$

Circular orbits

$$\text{Earth } v_E = \sqrt{\frac{GM}{149.6(10)^9}} = 29.758\text{ m/s}$$

$$\text{Mars } v_M = \sqrt{\frac{GM}{227.8(10)^9}} = 24.115\text{ m/s}$$

Conservation of angular momentum

Elliptical orbit

$$v_A(149.6) = v_B(227.8)$$

Conservation of energy

$$\frac{1}{2}v_A^2 - \frac{GM}{149.6(10)^9} = \frac{1}{2}v_B^2 - \frac{GM}{227.8(10)^9}$$

$$v_A = v_B\frac{(227.8)}{(149.6)} = 1.52273 v_B$$

$$\frac{1}{2}(1.52273)^2 v_B^2 - \frac{1.3247(10)^{20}}{149.6(10)^9} = \frac{1}{2}v_B^2 - \frac{1.3247(10)^{20}}{227.8(10)^9}$$

$$0.65935 v_B^2 = 3.0398(10)^8$$

$$v_B^2 = 4.6102(10)^8$$

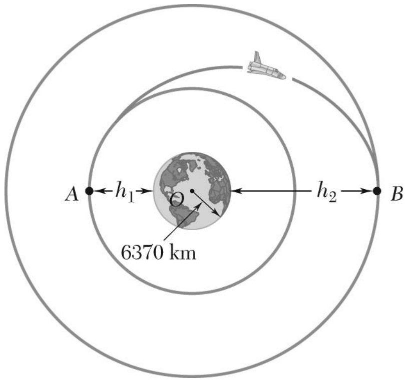
$$v_B = 21{,}471\text{ m/s},\ v_A = 32{,}695\text{ m/s}$$

(*a*) Increase at *A*, $v_A - v_E = 32.695 - 29.758 = 2.94\text{ km/s}$ ◀

(*b*) Increase at *B*, $v_B - v_M = 24.115 - 21.471 = 2.64\text{ km/s}$ ◀

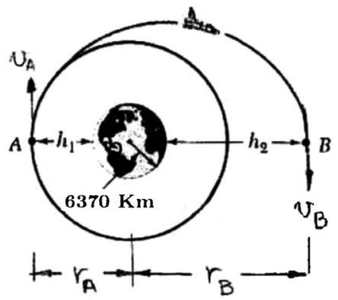
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.105



The optimal way of transferring a space vehicle from an inner circular orbit to an outer coplanar circular orbit is to fire its engines as it passes through A to increase its speed and place it in an elliptic transfer orbit. Another increase in speed as it passes through B will place it in the desired circular orbit. For a vehicle in a circular orbit about the earth at an altitude $h_1 = 200$ mi, which is to be transferred to a circular orbit at an altitude $h_2 = 500$ mi, determine (*a*) the required increases in speed at A and at B, (*b*) the total energy per unit mass required to execute the transfer.

SOLUTION



Elliptical orbit between A and B

Conservation of angular momentum

$$mr_Av_A = mr_Bv_B$$

$$v_A = \frac{r_B}{r_A}v_B = \frac{7.170}{6.690}v_B$$

$$r_A = 6370 \text{ km} + 320 \text{ km} = 6690 \text{ km}, \qquad r_A = 6.690 \times 10^6 \text{ m}$$

$$v_A = 1.0718 v_B \tag{1}$$

$$r_B = 6370 \text{ km} + 800 \text{ km} = 7170 \text{ km}, \qquad r_B = 7.170 \times 10^6 \text{ m}$$

$$R = (6370 \text{ km}) = 6.37 \times 10^6 \text{ m}$$

Conservation of energy

$$GM = gR^2 = (9.81 \text{ m/s}^2)(6.37 \times 10^6 \text{ m})^2 = 398.060 \times 10^{12} \text{ m}^3/\text{s}^2$$

Point A:

$$T_A = \frac{1}{2}mv_A^2 \qquad V_A = -\frac{GMm}{r_A} = -\frac{(398.060 \times 10^{12})m}{(6.690 \times 10^6)}$$

$$V_A = 59.501 \times 10^6 \text{ m}$$

Point B:

$$T_B = \frac{1}{2}mv_B^2 \qquad V_B = -\frac{GMm}{r_B} = -\frac{(398.060 \times 10^{12})m}{(7.170 \times 10^6)}$$

$$V_B = 55.5 \times 10^6 \text{ m}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}mv_A^2 - 59.501\times 10^6\ \text{m} = \frac{1}{2}mv_B^2 - 55.5\times 10^6\ \text{m}$$

$$v_A^2 - v_B^2 = 8.002\times 10^6$$

From (1) $\quad v_A = 1.0718v_B \quad v_B^2[(1.0718)^2 - 1] = 8.002\times 10^6$

$$v_B^2 = 53.79\times 10^6\ \text{m}^2/\text{s}^2, \qquad v_B = 7334\ \text{m/s}$$

$$v_A = (1.0718)(7334\ \text{m/s}) = 7861\ \text{m/s}$$

Circular orbit at A and B

(Equation 12.44)

$$(v_A)_C = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{398.060\times 10^{12}}{6.690\times 10^6}} = 7714\ \text{m/s}$$

$$(v_B)_C = \sqrt{\frac{GM}{r_B}} = \sqrt{\frac{398.060\times 10^{12}}{7.170\times 10^6}} = 7451\ \text{m/s}$$

(*a*) Increases in speed at A and B

$$\Delta v_A = v_A - (v_A)_C = 7861 - 7714 = 147\ \text{m/s} \blacktriangleleft$$

$$\Delta v_B = (v_B)_C - v_B = 7451 - 7334 = 117\ \text{m/s} \blacktriangleleft$$

(*b*) Total energy per unit mass

$$E/m = \frac{1}{2}[(v_A)^2 - (v_A)_C^2 + (v_B)_C^2 - (v_B)^2]$$

$$E/m = \frac{1}{2}[(7861)^2 - (7714)^2 + (7451)^2 - (7334)^2]$$

$$E/m = 2.01\times 10^6\ \text{J/kg} \blacktriangleleft$$

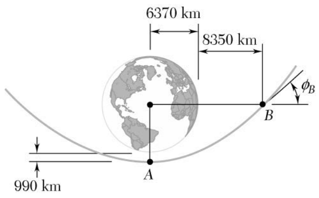
PROBLEM 13.106



During a flyby of the earth, the velocity of a spacecraft is 10.4 km/s as it reaches its minimum altitude of 990 km above the surface at Point A. At Point B the spacecraft is observed to have an altitude of 8350 km. Determine (*a*) the magnitude of the velocity at Point B, (*b*) the angle ϕ_B.

SOLUTION

At A:

$$h_A = vr = [1.04(10)^4 \text{ m/s}][6.37(10)^6 \text{ m} + 0.990(10)^6 \text{ m}]$$

$$h_A = 76.544(10)^9 \text{ m}^2/\text{s}$$

$$\frac{1}{m}(T_A + V_A) = \frac{1}{2}v^2 - \frac{GM}{r}$$

$$= \frac{1}{2}[1.04(10)^4]^2 - \frac{(9.81)[6.37(10)^6]^2}{[6.37(10)^6 + 0.990(10)^6]} \cong 0$$

(Parabolic orbit)

At B:

$$\frac{1}{m}(T_B + V_B) = \frac{1}{2}v_B^2 - \frac{GM}{r_B} = 0$$

$$\frac{1}{2}v_B^2 = \frac{(9.81)[6.37(10^6)]^2}{[6.37(10)^6 + 8.35(10)^6]}$$

$$v_B^2 = 54.084(10)^6$$

(*a*) $v_B = 7.35 \text{ km/s}$ ◀

$$h_B = v_B \sin\phi_B r_B = 76.544(10)^9$$

$$\sin\phi_B = \frac{76.544(10)^9}{7.35(10^6)[6.37(10)^6 + 8.35(10)^6]}$$

$$= 0.707483$$

(*b*) $\phi_B = 45.0°$ ◀

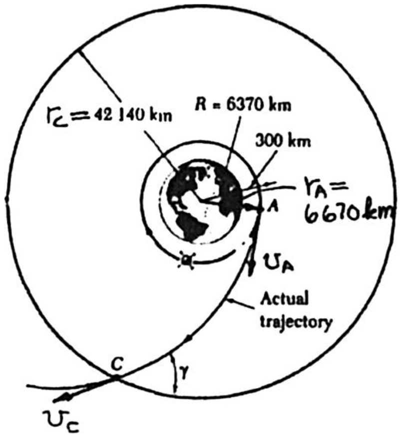
PROBLEM 13.107

A space platform is in a circular orbit about the earth at an altitude of 300 km. As the platform passes through A, a rocket carrying a communications satellite is launched from the platform with a relative velocity of magnitude 3.44 km/s in a direction tangent to the orbit of the platform. This was intended to place the rocket in an elliptic transfer orbit bringing it to Point B, where the rocket would again be fired to place the satellite in a geosynchronous orbit of radius 42,140 km. After launching, it was discovered that the relative velocity imparted to the rocket was too large. Determine the angle γ at which the rocket will cross the intended orbit at Point C.

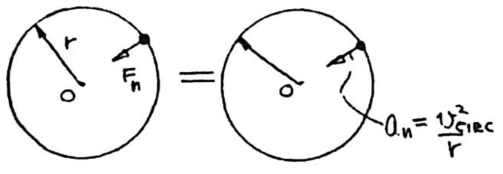
SOLUTION



$$R = 6370 \text{ km}$$
$$r_A = 6370 \text{ km} + 300 \text{ km}$$
$$r_A = 6.67 \times 10^6 \text{ m}$$
$$r_C = 42.14 \times 10^6 \text{ m}$$
$$GM = gR^2$$
$$GM = (9.81 \text{ m/s})(6.37 \times 10^6 \text{ m})^2$$
$$GM = 398.1 \times 10^{12} \text{ m}^3/\text{s}^2$$

For any circular orbit:

$$F_n = ma_n = \frac{mv_{\text{circ}}^2}{r}$$



$$F_n = \frac{GMm}{r^2} = m\frac{v_{\text{circ}}^2}{r}$$
$$v_{\text{circ}} = \sqrt{\frac{GM}{r}}$$

Velocity at A:

$$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{(398.1 \times 10^{12} \text{ m}^3/\text{s}^3)}{(6.67 \times 10^6 \text{ m})}} = 7.726 \times 10^3 \text{ m/s}$$
$$v_A = (v_A)_{\text{circ}} + (v_A)_R = 7.726 \times 10^3 + 3.44 \times 10^3 = 11.165 \times 10^3 \text{ m/s}$$

If you are a student using this Manual, you are using it without permission.*

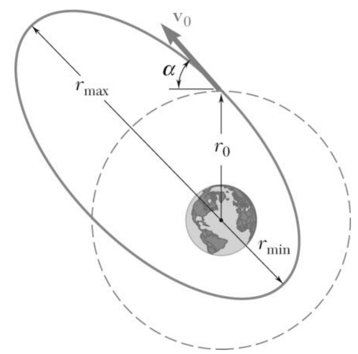
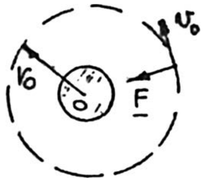
PROBLEM 13.108



A satellite is projected into space with a velocity $\mathbf{v}_0$ at a distance r_0 from the center of the earth by the last stage of its launching rocket. The velocity $\mathbf{v}_0$ was designed to send the satellite into a circular orbit of radius r_0. However, owing to a malfunction of control, the satellite is not projected horizontally but at an angle α with the horizontal and, as a result, is propelled into an elliptic orbit. Determine the maximum and minimum values of the distance from the center of the earth to the satellite.

SOLUTION



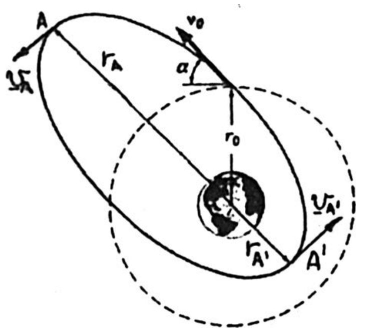
For circular orbit of radius r_0

$$F = ma_n \qquad \frac{GMm}{r_0^2} = m\frac{v_0^2}{r_0}$$

$$v_0^2 = \frac{GM}{r_0}$$

But v_0 forms an angle α with the intended circular path.

For elliptic orbit.



Conservation of angular momentum:

$$r_0 m v_0 \cos\alpha = r_A m v_A$$

$$v_A = \left(\frac{r_0}{r_A}\cos\alpha\right) v_0 \qquad (1)$$

Conservation of energy:

$$\frac{1}{2}mv_0^2 - \frac{GMm}{r_0} = \frac{1}{2}mv_A^2 - \frac{GMm}{r_A}$$

$$v_0^2 - v_A^2 = \frac{2GM}{r_0}\left(1 - \frac{r_0}{r_A}\right)$$

Substitute for v_A from (1)

$$v_0^2\left[1 - \left(\frac{r_0}{r_A}\right)^2 \cos^2\alpha\right] = \frac{2GM}{r_0}\left(1 - \frac{r_0}{r_A}\right)$$

But $\quad v_0^2 = \dfrac{GM}{r_0}, \qquad$ thus $\quad 1 - \left(\dfrac{r_0}{r_A}\right)^2 \cos^2\alpha = 2\left(1 - \dfrac{r_0}{r_A}\right)$

$$\cos^2\alpha\left(\frac{r_0}{r_A}\right)^2 - 2\left(\frac{r_0}{r_A}\right) + 1 = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Solving for $\dfrac{r_0}{r_A}$

$$\frac{r_0}{r_A} = \frac{+2 \pm \sqrt{4 - 4\cos^2\alpha}}{2\cos^2\alpha} = \frac{1 \pm \sin\alpha}{1 - \sin^2\alpha}$$

$$r_A = \frac{(1+\sin\alpha)(1-\sin\alpha)}{1 \pm \sin\alpha} r_0 = (1 \mp \sin\alpha) r_0$$

↖ also valid for Point A'

Thus,

$$r_{\text{max}} = (1+\sin\alpha)r_0 \qquad r_{\text{min}} = (1-\sin\alpha)r_0 \blacktriangleleft$$

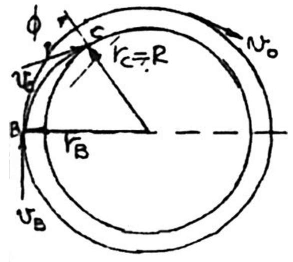
PROBLEM 13.109

Upon the LEM's return to the command module, the Apollo spacecraft of Problem 13.88 was turned around so that the LEM faced to the rear. The LEM was then cast adrift with a velocity of 200 m/s relative to the command module. Determine the magnitude and direction (angle ϕ formed with the vertical OC) of the velocity $\mathbf{v}_C$ of the LEM just before it crashed at C on the moon's surface.

SOLUTION

Command module in circular orbit



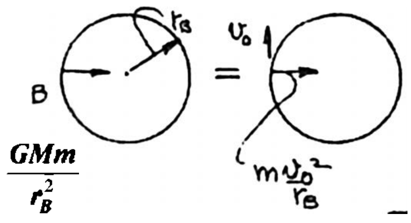
$R = 1740$ km

$$r_B = 1740 + 140 = 1880 \text{ km} = 1.88\times 10^6 \text{ m}$$

$$GM_{\text{moon}} = 0.0123\, GM_{\text{earth}} = 0.0123\, gR^2$$

$$= 0.0123(9.81)(6.37\times 10^6)^2 = 4.896\times 10^{12}\, \text{m}^3/\text{s}^2$$

$$\Sigma F = ma_n \quad \frac{GM_m m}{r_B^2} = \frac{mv_0^2}{r_B}$$



$$v_0 = \sqrt{\frac{GMm}{r_B}} = \sqrt{\frac{4.896\times 10^{12}}{1.88\times 10^6}}$$

$$v_0 = 1614 \text{ m/s} \qquad v_B = 1614 - 200 = 1414 \text{ m/s}$$

Conservation of energy between B and C:

$$\frac{1}{2}mv_B^2 - \frac{GM_m m}{r_B} = \frac{1}{2}mv_C^2 - \frac{GM_m m}{r_C} \qquad r_C = R$$

$$v_C^2 = v_B^2 + \frac{2GMm}{r_B}\left(\frac{r_B}{R} - 1\right)$$

$$v_C^2 = (1414 \text{ m/s})^2 + 2\frac{(4.896\times 10^{12}\, \text{m}^3/\text{s}^2)}{(1.88\times 10^6 \text{m})}\left(\frac{1.88\times 10^6}{1.74\times 10^6} - 1\right)$$

$$v_C^2 = 1.999\times 10^6 + 0.4191\times 10^6 = 2.418\times 10^6\, \text{m}^2/\text{s}^2$$

$v_C = 1555$ m/s ◀

Conservation of angular momentum:

$$r_B m v_B = R m v_C \sin\phi$$

$$\sin\phi = \frac{r_B v_B}{r_C v_C} = \frac{(1.88\times 10^6 \text{ m})(1414 \text{ m/s})}{(1.74\times 10^6 \text{ m})(1555 \text{ m/s})} = 0.98249$$

$$\phi = 79.26°$$

$\phi = 79.3°$ ◀

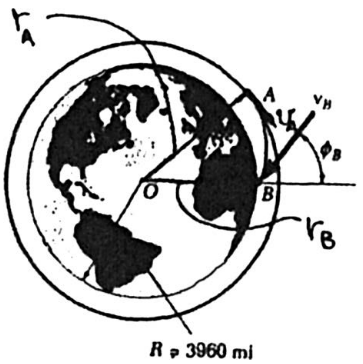
PROBLEM 13.110

A space vehicle is in a circular orbit at an altitude of 225 mi above the earth. To return to earth, it decreases its speed as it passes through A by firing its engine for a short interval of time in a direction opposite to the direction of its motion. Knowing that the velocity of the space vehicle should form an angle $\phi_B = 60°$ with the vertical as it reaches Point B at an altitude of 40 mi, determine (a) the required speed of the vehicle as it leaves its circular orbit at A, (b) its speed at Point B.

SOLUTION



(a)

$$r_A = 3960 \text{ mi} + 225 \text{ mi} = 4185 \text{ mi}$$

$$r_A = 4185 \text{ mi} \times 5280 \text{ ft/mi} = 22{,}097 \times 10^3 \text{ ft}$$

$$r_B = 3960 \text{ mi} + 40 \text{ mi} = 4000 \text{ mi}$$

$$r_B = 4000 \times 5280 = 21{,}120 \times 10^3 \text{ ft}$$

$$R = 3960 \text{ mi} = 20{,}909 \times 10^3 \text{ ft}$$

$$GM = gR^2 = (32.2 \text{ ft/s}^2)(20{,}909 \times 10^3 \text{ ft})^2$$

$$GM = 14.077 \times 10^{15} \text{ ft}^3/\text{s}^2$$

Conservation of energy:

$$T_A = \frac{1}{2} m v_A^2$$

$$V_A = \frac{-GMm}{r_A}$$

$$= \frac{-14.077 \times 10^{15} m}{22{,}097 \times 10^3}$$

$$= -637.1 \times 10^6 m$$

$$T_B = \frac{1}{2} m v_B^2$$

$$V_B = \frac{-GMm}{r_B}$$

$$= \frac{-14.077 \times 10^{15} m}{21{,}120 \times 10^3}$$

$$= -666.5 \times 10^6 m$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2} \not{m} v_A^2 - 637.1 \times 10^6 \not{m} = \frac{1}{2} \not{m} v_B^2 - 666.5 \times 10^6 \not{m}$$

$$v_A^2 = v_B^2 - 58.94 \times 10^6 \qquad (1)$$

PROBLEM 13.110 (Continued)

Conservation of angular momentum:

$$r_A m v_A = r_B m v_B \sin\phi_B$$

$$v_B = \frac{(r_A)v_A}{(r_B)(\sin\phi_B)} = \frac{4185}{4000}\left(\frac{1}{\sin 60°}\right)v_A$$

$$v_B = 1.208\, v_A \qquad (2)$$

Substitute v_B from (2) in (1)

$$v_A^2 = (1.208 v_A)^2 - 58.94\times 10^6$$

$$v_A^2[(1.208)^2 - 1] = 58.94\times 10^6$$

$$v_A^2 = 128.27\times 10^6 \text{ ft}^2/\text{s}^2$$

(*a*) $v_A = 11.32\times 10^3$ ft/s ◀

(*b*) From (2)

$$v_B = 1.208 v_A$$

$$= 1.208(11.32\times 10^6)$$

$$= 13.68\times 10^3 \text{ ft/s}$$

$v_B = 13.68\times 10^3$ ft/s ◀

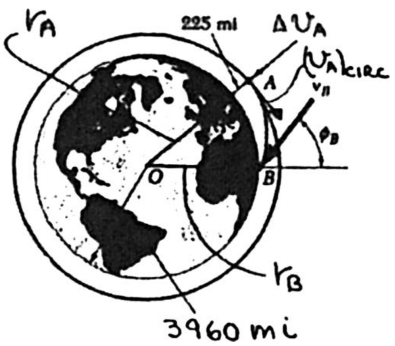
PROBLEM 13.111*

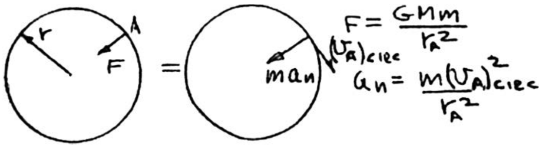
In Problem 13.110, the speed of the space vehicle was decreased as it passed through A by firing its engine in a direction opposite to the direction of motion. An alternative strategy for taking the space vehicle out of its circular orbit would be to turn it around so that its engine would point away from the earth and then give it an incremental velocity $\Delta\mathbf{v}_A$ toward the center O of the earth. This would likely require a smaller expenditure of energy when firing the engine at A, but might result in too fast a descent at B. Assuming this strategy is used with only 50 percent of the energy expenditure used in Problem 13.109, determine the resulting values of ϕ_B and v_B.

SOLUTION



$$r_A = 3960\text{ mi} + 225\text{ mi}$$
$$r_A = 4185\text{ mi} = 22.097\times10^6\text{ ft}$$
$$r_B = 3960\text{ mi} + 40\text{ mi} = 4000\text{ mi}$$
$$r_B = 21.120\times10^6\text{ ft}$$
$$GM = gR^2 = (32.2\text{ ft/s}^2)[(3960)(5280)\text{ ft}^2]$$
$$GM = 14.077\times10^{15}\text{ ft}^3/\text{s}^2$$

Velocity in circular orbit at 225 m altitude:



Newton's second law

$$F = ma_n: \quad \frac{GMm}{r_A^2} = \frac{m(v_A)_{\text{circ}}^2}{r_A}$$

$$(v_A)_{\text{circ}} = \sqrt{\frac{GM}{r_A}} = \sqrt{\frac{14.077\times10^{15}}{22.097\times10^6}}$$
$$= 25.24\times10^3\text{ ft/s}$$

Energy expenditure:

From Problem 13.110, $\quad v_A = 11.32\times10^3\text{ ft/s}$

Energy, $\quad \Delta E_{109} = \frac{1}{2}m(v_A)_{\text{circ}}^2 - \frac{1}{2}mv_A^2$

$$\Delta E_{109} = \frac{1}{2}m(25.24\times10^3)^2 - \frac{1}{2}m(11.32\times10^3)^2$$
$$\Delta E_{109} = 254.46\times10^6\, m\text{ ft}\cdot\text{lb}$$
$$\Delta E_{110} = (0.50)\Delta E_{109} = \frac{(254.46\times10^6\, m)}{2}\text{ft}\cdot\text{lb}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.111* (Continued)

Thus, additional kinetic energy at A is

$$\frac{1}{2}m(\Delta v_A)^2 = \Delta E_{110} = \frac{(254.46\times 10^6 m)}{2}\text{ ft}\cdot\text{lb} \qquad (1)$$

Conservation of energy between A and B:

$$T_A = \frac{1}{2}m[(v_A)^2_{\text{circ}} + (\Delta v_A)^2] \qquad V_A = \frac{-GMm}{r_A}$$

$$T_B = \frac{1}{2}mv_B^2 \qquad V_B = \frac{-GMm}{r_A}$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}m(25.24\times 10^3)^2 + \frac{254.46\times 10^6 m}{2} - \frac{14.077\times 10^{15} m}{22.097\times 10^6} = \frac{1}{2}mv_B^2 - \frac{14.077\times 10^{15} m}{21.120\times 10^6}$$

$$v_B^2 = 637.06\times 10^6 + 254.46\times 10^6 - 1274.1\times 10^6 + 1333\times 10^6$$

$$v_B^2 = 950.4\times 10^3$$

$$v_B = 30.88\times 10^3 \text{ ft/s} \blacktriangleleft$$

Conservation of angular momentum between A and B:

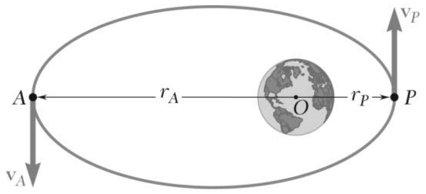
$$r_A m(v_A)_{\text{circ}} = r_B m v_B \sin\phi_B$$

$$\sin\phi_B = \left(\frac{r_A}{r_B}\right)\frac{(v_A)_{\text{circ}}}{(v_B)} = \frac{(4185)}{(4000)}\frac{(25.24\times 10^3)}{(30.88\times 10^3)} = 0.8565$$

$$\phi_B = 58.9° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.112



Show that the values v_A and v_P of the speed of an earth satellite at the apogee A and the perigee P of an elliptic orbit are defined by the relations

$$v_A^2 = \frac{2GM}{r_A + r_P}\frac{r_P}{r_A} \qquad v_P^2 = \frac{2GM}{r_A + r_P}\frac{r_A}{r_P}$$

where M is the mass of the earth, and r_A and r_P represent, respectively, the maximum and minimum distances of the orbit to the center of the earth.

SOLUTION

Conservation of angular momentum:

$$r_A m v_A = r_P m v_P$$

$$v_A = \frac{r_P}{r_A} v_P \qquad (1)$$

Conservation of energy:

$$\frac{1}{2} m v_P^2 - \frac{GMm}{r_P} = \frac{1}{2} m v_A^2 - \frac{GMm}{r_A} \qquad (2)$$

Substituting for v_A from (1) into (2)

$$v_P^2 - \frac{2GM}{r_P} = \left(\frac{r_P}{r_A}\right)^2 v_P^2 - \frac{2GM}{r_A}$$

$$\left(1 - \left(\frac{r_P}{r_A}\right)^2\right) v_P^2 = 2GM\left(\frac{1}{r_P} - \frac{1}{r_A}\right)$$

$$\frac{r_A^2 - r_P^2}{r_A^2} v_P^2 = 2GM\,\frac{r_A - r_P}{r_A r_P}$$

with $\quad r_A^2 - r_P^2 = (r_A - r_P)(r_A + r_P)$

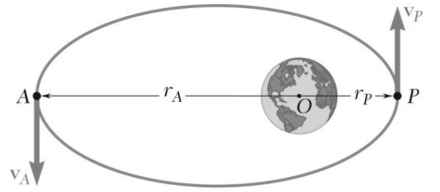
$$v_P^2 = \frac{2GM}{r_A + r_P}\left(\frac{r_A}{r_P}\right) \quad (3) \blacktriangleleft$$

Exchanging subscripts P and A

$$v_A^2 = \frac{2GM}{r_A + r_P}\left(\frac{r_P}{r_A}\right) \qquad \text{Q.E.D.} \qquad \blacktriangleleft$$

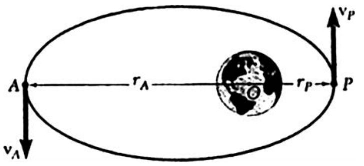
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.113



Show that the total energy E of an earth satellite of mass m describing an elliptic orbit is $E = -GMm/(r_A + r_P)$, where M is the mass of the earth, and r_A and r_P represent, respectively, the maximum and minimum distances of the orbit to the center of the earth. (Recall that the gravitational potential energy of a satellite was defined as being zero at an infinite distance from the earth.)

SOLUTION



See solution to Problem 13.112 (above) for derivation of Equation (3).

$$v_P^2 = \frac{2GM}{(r_A + r_P)} \frac{r_A}{r_P}$$

Total energy at Point P is

$$E = T_P + V_P = \frac{1}{2} m v_P^2 - \frac{GMm}{r_P}$$

$$= \frac{1}{2} \left[\frac{2GMm}{(r_A + r_0)} \frac{r_A}{r_P} \right] - \frac{GMm}{r_P}$$

$$= GMm \left[\frac{r_A}{r_P(r_A + r_P)} - \frac{1}{r_P} \right]$$

$$= GMm \frac{(r_A - r_A - r_P)}{r_P(r_A + r_P)}$$

$$E = -\frac{GMm}{r_A + r_P} \blacktriangleleft$$

Note: Recall that gravitational potential of a satellite is defined as being zero at an infinite distance from the earth.

If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.114*

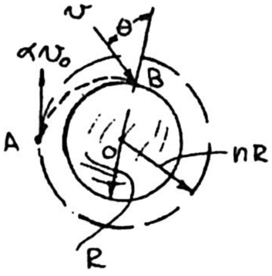
A space probe describes a circular orbit of radius nR with a velocity $\mathbf{v}_0$ about a planet of radius R and center O. Show that (a) in order for the probe to leave its orbit and hit the planet at an angle θ with the vertical, its velocity must be reduced to $\alpha\mathbf{v}_0$, where

$$\alpha = \sin\theta\sqrt{\frac{2(n-1)}{n^2-\sin^2\theta}}$$

(b) the probe will not hit the planet if α is larger than $\sqrt{2/(1+n)}$.

SOLUTION

(a) Conservation of energy:



At A:
$$T_A = \frac{1}{2}m(\alpha v_0)^2$$
$$V_A = -\frac{GMm}{nR}$$

At B:
$$T_B = \frac{1}{2}mv^2$$
$$V_B = -\frac{GMm}{R}$$

M = mass of planet

m = mass of probe

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}\cancel{m}(\alpha v_0)^2 - \frac{GM\cancel{m}}{nR} = \frac{1}{2}\cancel{m}v^2 - \frac{GM\cancel{m}}{R} \quad (1)$$

Conservation of angular momentum:

$$nRm\alpha v_0 = Rmv\sin\theta$$

$$v = \frac{n\alpha v_0}{\sin\theta} \quad (2)$$

Replacing v in (1) by (2)

$$(\alpha v_0)^2 - \frac{2GM}{nR} = \left(\frac{n\alpha v_0}{\sin\theta}\right)^2 - \frac{2GM}{R} \quad (3)$$

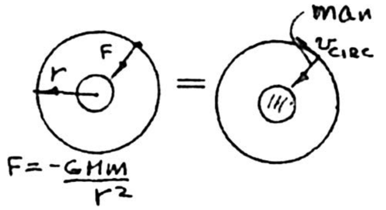
PROBLEM 13.114* (Continued)

For any circular orbit.



$$a_n = \frac{v^2}{r}$$

Newton's second law

$$\frac{-GMm}{r^2} = \frac{m(v)^2_{\text{circ}}}{r}$$

$$v_{\text{circ}} = \sqrt{\frac{GM}{r}}$$

For $r = nR$, $$v_0 = v_{\text{circ}} = \sqrt{\frac{GM}{nR}}$$

Substitute for v_0 in (3)

$$\alpha^2 \frac{GM}{nR} - \frac{2GM}{nR} = \frac{n^2\alpha^2}{\sin^2\theta}\left(\frac{GM}{nR}\right) - \frac{2GM}{R}$$

$$\alpha^2\left[1 - \frac{n^2}{\sin^2\theta}\right] = 2(1-n)$$

$$\alpha^2 = \frac{2(1-n)(\sin^2\theta)}{(\sin^2\theta - n^2)} = \frac{2(n-1)\sin^2\theta}{(n^2 - \sin^2\theta)}$$

$$\alpha = \sin\theta\sqrt{\frac{2(n-1)}{n^2 - \sin^2\theta}} \qquad \text{Q.E.D.}$$ ◀

(*b*) Probe will just miss the planet if $\theta > 90°$,

$$\alpha = \sin 90°\sqrt{\frac{2(n-1)}{n^2 - \sin^2 90°}} = \sqrt{\frac{2}{n+1}}$$ ◀

Note: $$n^2 - 1 = (n-1)(n+1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.115

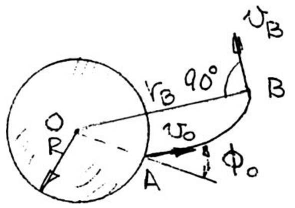
A missile is fired from the ground with an initial velocity $\mathbf{v}_0$ forming an angle ϕ_0 with the vertical. If the missile is to reach a maximum altitude equal to αR, where R is the radius of the earth, (*a*) show that the required angle ϕ_0 is defined by the relation

$$\sin\phi_0 = (1+\alpha)\sqrt{1-\frac{\alpha}{1+\alpha}\left(\frac{v_{\text{esc}}}{v_0}\right)^2}$$

where v_{esc} is the escape velocity, (*b*) determine the range of allowable values of v_0.

SOLUTION

(*a*) $$r_A = R$$



Conservation of angular momentum:

$$Rmv_0\sin\phi_0 = r_B m v_B$$

$$r_B = R + \alpha R = (1+\alpha)R$$

$$v_B = \frac{Rv_0\sin\phi_0}{(1+\alpha)R} = \frac{v_0\sin\phi_0}{(1+\alpha)} \qquad (1)$$

Conservation of energy:

$$T_A + V_A = T_B + V_B \qquad \frac{1}{2}mv_0^2 - \frac{GMm}{R} = \frac{1}{2}mv_B^2 - \frac{GMm}{(1+\alpha)R}$$

$$v_0^2 - v_B^2 = \frac{2GMm}{R}\left(1-\frac{1}{1+\alpha}\right) = \frac{2GMm}{R}\left(\frac{\alpha}{1+\alpha}\right)$$

Substitute for v_B from (1)

$$v_0^2\left(1-\frac{\sin^2\phi_0}{(1+\alpha)^2}\right) = \frac{2GMm}{R}\left(\frac{\alpha}{1+\alpha}\right)$$

From Equation (12.43): $$v_{\text{esc}}^2 = \frac{2GM}{R}$$

$$v_0^2\left(1-\frac{\sin^2\phi_0}{(1+\alpha)^2}\right) = v_{\text{esc}}^2\left(\frac{\alpha}{1+\alpha}\right)$$

$$\frac{\sin^2\phi_0}{(1+\alpha)^2} = 1-\left(\frac{v_{\text{esc}}}{v_0}\right)^2\frac{\alpha}{1+\alpha} \qquad (2)$$

$$\sin\phi_0 = (1+\alpha)\sqrt{1-\frac{\alpha}{1+\alpha}\left(\frac{v_{\text{esc}}}{v_0}\right)^2} \qquad \text{Q.E.D.}$$

If you are a student using this Manual, you are using it without permission.*

(*b*) Allowable values of v_0 (for which maximum altitude = αR)

$$0 < \sin^2 \phi_0 < 1$$

For $\sin \phi_0 = 0,$ from (2)

$$0 = 1 - \left(\frac{v_{\text{esc}}}{v_0} \right)^2 \frac{\alpha}{1+\alpha}$$

$$v_0 = v_{\text{esc}} \sqrt{\frac{\alpha}{1+\alpha}}$$

For $\sin \phi_0 = 1,$ from (2)

$$\frac{1}{(1+\alpha)^2} = 1 - \left(\frac{v_{\text{esc}}}{v_0} \right)^2 \frac{\alpha}{1+\alpha}$$

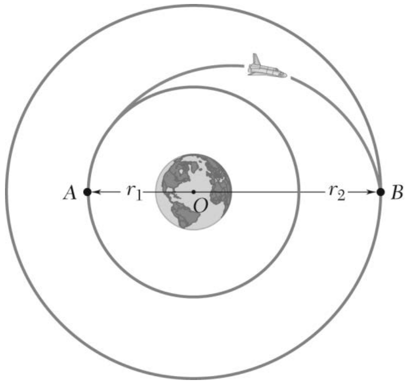
$$\left(\frac{v_{\text{esc}}}{v_0} \right)^2 = \frac{1}{\alpha}\left(1+\alpha - \frac{1}{1+\alpha} \right) = \frac{1+2\alpha+\alpha^2-1}{\alpha(1+\alpha)} = \frac{2+\alpha}{1+\alpha}$$

$$v_0 = v_{\text{esc}} \sqrt{\frac{1+\alpha}{2+\alpha}}$$

$$v_{\text{esc}} \sqrt{\frac{\alpha}{1+\alpha}} < v_0 < v_{\text{esc}} \sqrt{\frac{1+\alpha}{2+\alpha}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.116



A spacecraft of mass m describes a circular orbit of radius r_1 around the earth. (a) Show that the additional energy ΔE which must be imparted to the spacecraft to transfer it to a circular orbit of larger radius r_2 is

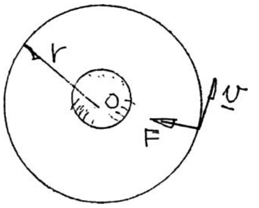
$$\Delta E = \frac{GMm(r_2 - r_1)}{2r_1 r_2}$$

where M is the mass of the earth. (b) Further show that if the transfer from one circular orbit to the other is executed by placing the spacecraft on a transitional semielliptic path AB, the amounts of energy ΔE_A and ΔE_B which must be imparted at A and B are, respectively, proportional to r_2 and r_1:

$$\Delta E_A = \frac{r_2}{r_1 + r_2}\Delta E \qquad \Delta E_B = \frac{r_1}{r_1 + r_2}\Delta E$$

SOLUTION

(a) For a *circular* orbit of radius r



$$F = ma_n: \quad \frac{GMm}{r^2} = m\frac{v^2}{r}$$

$$v^2 = \frac{GM}{r}$$

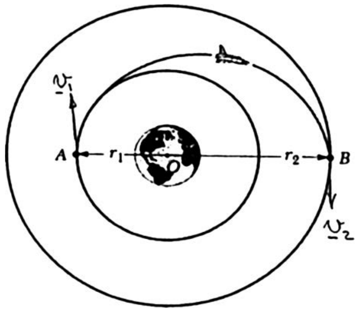
$$E = T + V = \frac{1}{2}mv^2 - \frac{GMm}{r} = -\frac{1}{2}\frac{GMm}{r} \qquad (1)$$

Thus ΔE required to pass from circular orbit of radius r_1 to circular orbit of radius r_2 is

$$\Delta E = E_1 - E_2 = -\frac{1}{2}\frac{GMm}{r_1} + \frac{1}{2}\frac{GMm}{r_2}$$

$$\Delta E = \frac{GMm(r_2 - r_1)}{2r_1 r_2} \qquad \text{Q.E.D.} \qquad (2)$$

(b) For an elliptic orbit, we recall Equation (3) derived in Problem 13.113 (with $v_P = v_1$)



$$v_1^2 = \frac{2Gm}{(r_1 + r_2)}\frac{r_2}{r_1}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.116 (Continued)

At Point A: Initially spacecraft is in a circular orbit of radius r_1.

$$v_{\text{circ}}^2 = \frac{GM}{r_1}$$

$$T_{\text{circ}} = \frac{1}{2}mv_{\text{circ}}^2 = \frac{1}{2}m\frac{GM}{r_1}$$

After the spacecraft engines are fired and it is placed on a semi-elliptic path AB, we recall

$$v_1^2 = \frac{2GM}{(r_1 + r_2)} \cdot \frac{r_2}{r_1}$$

and
$$T_1 = \frac{1}{2}mv_1^2 = \frac{1}{2}m\frac{2GMr_2}{r_1(r_1 + r_2)}$$

At Point A, the increase in energy is

$$\Delta E_A = T_1 - T_{\text{circ}} = \frac{1}{2}m\frac{2GMr_2}{r_1(r_1 + r_2)} - \frac{1}{2}m\frac{GM}{r_1}$$

$$\Delta E_A = \frac{GMm(2r_2 - r_1 - r_2)}{2r_1(r_1 + r_2)} = \frac{GMm(r_2 - r_1)}{2r_1(r_1 + r_2)}$$

$$\Delta E_A = \frac{r_2}{r_1 + r_2}\left[\frac{GMm(r_2 - r_1)}{2r_1r_2}\right]$$

Recall Equation (2):
$$\Delta E_A = \frac{r_2}{(r_1 + r_2)}\Delta E \qquad \text{Q.E.D.}$$

A similar derivation at Point B yields,

$$\Delta E_B = \frac{r_1}{(r_1 + r_2)}\Delta E \qquad \text{Q.E.D.}$$

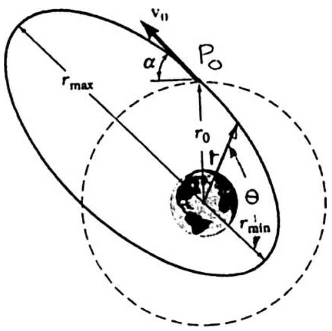
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.117*

Using the answers obtained in Problem 13.108, show that the intended circular orbit and the resulting elliptic orbit intersect at the ends of the minor axis of the elliptic orbit.

PROBLEM 13.108 A satellite is projected into space with a velocity $\mathbf{v}_0$ at a distance r_0 from the center of the earth by the last stage of its launching rocket. The velocity $\mathbf{v}_0$ was designed to send the satellite into a circular orbit of radius r_0. However, owing to a malfunction of control, the satellite is not projected horizontally but at an angle α with the horizontal and, as a result, is propelled into an elliptic orbit. Determine the maximum and minimum values of the distance from the center of the earth to the satellite.

SOLUTION



If the point of intersection P_0 of the circular and elliptic orbits is at an end of the minor axis, then v_0 is parallel to the major axis. This will be the case only if $\alpha + 90° = \theta_0$, that is if $\cos\theta_0 = -\sin\alpha$. We must therefore prove that

$$\cos\theta_0 = -\sin\alpha \quad (1)$$

We recall from Equation (12.39):

$$\frac{1}{r} = \frac{GM}{h^2} + C\cos\theta \quad (2)$$

When $\theta = 0$, $\quad r = r_{min}$ and $r_{min} = r_0(1-\sin\alpha)$

$$\frac{1}{r_0(1-\sin\alpha)} = \frac{GM}{h^2} + C \quad (3)$$

For $\theta = 180°$, $\quad r = r_{max} = r_0(1+\sin\alpha)$

$$\frac{1}{r_0(1+\sin\alpha)} = \frac{GM}{h^2} - C \quad (4)$$

Adding (3) and (4) and dividing by 2:

$$\frac{GM}{h^2} = \frac{1}{2r_0}\left(\frac{1}{1-\sin\alpha} + \frac{1}{1+\sin\alpha}\right)$$

$$= \frac{1}{r_0\cos^2\alpha}$$

Subtracting (4) from (3) and dividing by 2:

$$C = \frac{1}{2r_0}\left(\frac{1}{1-\sin\alpha} - \frac{1}{1+\sin\alpha}\right) = \left(\frac{1}{2r_0}\right)\frac{2\sin\alpha}{1-\sin^2\alpha}$$

$$C = \frac{\sin\alpha}{r_0\cos^2\alpha}$$

PROBLEM 13.117* (Continued)

Substituting for $\frac{GM}{h^2}$ and C into Equation (2)

$$\frac{1}{r} = \frac{1}{r_0 \cos^2 \alpha}(1 + \sin\alpha \cos\theta) \tag{5}$$

Letting $r = r_0$ and $\theta = \theta_0$ in Equation (5), we have

$$\cos^2 \alpha = 1 + \sin\alpha \cos\theta_0$$

$$\cos\theta_0 = \frac{\cos^2\alpha - 1}{\sin\alpha} = -\frac{\sin^2\alpha}{\sin\alpha} = -\sin\alpha$$

This proves the validity of Equation (1) and thus P_0 is an end of the minor axis of the elliptic orbit.

PROBLEM 13.118*

(*a*) Express in terms of $r_{\min}$ and $v_{\max}$ the angular momentum per unit mass, h, and the total energy per unit mass, E/m, of a space vehicle moving under the gravitational attraction of a planet of mass M (Figure 13.15). (*b*) Eliminating $v_{\max}$ between the equations obtained, derive the formula

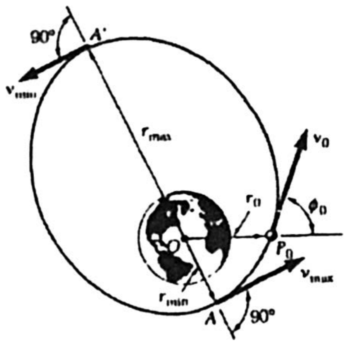
$$\frac{1}{r_{\min}} = \frac{GM}{h^2}\left[1 + \sqrt{1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2}\right]$$

(*c*) Show that the eccentricity ε of the trajectory of the vehicle can be expressed as

$$\varepsilon = \sqrt{1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2}$$

(*d*) Further show that the trajectory of the vehicle is a hyperbola, an ellipse, or a parabola, depending on whether E is positive, negative, or zero.

SOLUTION



(*a*) Point *A*:

Angular momentum per unit mass.

$$h = \frac{H_0}{m}$$

$$= \frac{r_{\min} m v_{\max}}{m}$$

$$h = r_{\min} v_{\max} \qquad (1) \blacktriangleleft$$

Energy per unit mass

$$\frac{E}{m} = \frac{1}{m}(T + V)$$

$$\frac{E}{m} = \frac{1}{m}\left(\frac{1}{2}mv_{\max}^2 - \frac{GMm}{r_{\min}}\right) = \frac{1}{2}v_{\max}^2 - \frac{GM}{r_{\min}} \qquad (2) \blacktriangleleft$$

(*b*) From Eq. (1): $v_{\max} = h/r_{\min}$ substituting into (2)

$$\frac{E}{m} = \frac{1}{2}\frac{h^2}{r_{\min}^2} - \frac{GM}{r_{\min}}$$

$$\left(\frac{1}{r_{\min}}\right)^2 - \frac{2GM}{h^2}\cdot\frac{1}{r_{\min}} - \frac{2\left(\frac{E}{m}\right)}{h^2} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.118* (Continued)

Solving the quadratic: $\dfrac{1}{r_{\min}} = \dfrac{GM}{h^2} + \sqrt{\left(\dfrac{GM}{h^2}\right)^2 + \dfrac{2\left(\frac{E}{m}\right)}{h^2}}$

Rearranging

$$\frac{1}{r_{\min}} = \frac{GM}{h^2}\left[1 + \sqrt{1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2}\right] \qquad (3) \blacktriangleleft$$

(*c*) Eccentricity of the trajectory:

Eq. (12.39′) $\dfrac{1}{r} = \dfrac{GM}{h^2}(1 + \varepsilon\cos\theta)$

When $\theta = 0$, $\cos\theta = 1$ and $r = r_{\min}$

Thus,

$$\frac{1}{r_{\min}} = \frac{GM}{h^2}(1 + \varepsilon) \qquad (4)$$

Comparing (3) and (4), $\varepsilon = \sqrt{1 + \dfrac{2E}{m}\left(\dfrac{h}{GM}\right)^2}$ (5)

(*d*) Recalling discussion in section 12.12 and in view of Eq. (5)

1. Hyperbola if $\varepsilon > 1$, that is, if $E > 0$ ◀
2. Parabola if $\varepsilon = 1$, that is, if $E = 0$ ◀
3. Ellipse if $\varepsilon < 1$, that is, if $E < 0$ ◀

Note: For circular orbit $\varepsilon = 0$ and

$$1 + \frac{2E}{m}\left(\frac{h}{GM}\right)^2 = 0 \qquad \text{or} \qquad E = -\left(\frac{GM}{h}\right)^2 \frac{m}{2},$$

but for circular orbit $v^2 = \dfrac{GM}{r}$ and $h^2 = v^2 r^2 = GMr,$

thus $E = -\dfrac{1}{2} m \dfrac{(GM)^2}{GMr} = -\dfrac{1}{2}\dfrac{GMm}{r}$

PROBLEM 13.CQ4

A large insect impacts the front windshield of a sports car traveling down a road. Which of the following statements is true during the collision?

(*a*) The car exerts a greater force on the insect than the insect exerts on the car.

(*b*) The insect exerts a greater force on the car than the car exerts on the insect.

(*c*) The car exerts a force on the insect, but the insect does not exert a force on the car.

(*d*) The car exerts the same force on the insect as the insect exerts on the car.

(*e*) Neither exerts a force on the other; the insect gets smashed simply because it gets in the way of the car.

SOLUTION

Answer: (*d*) This is Newton's 3rd Law.

PROBLEM 13.CQ5

The expected damages associated with two types of perfectly plastic collisions are to be compared. In the first case, two identical cars traveling at the same speed impact each other head on. In the second case, the car impacts a massive concrete wall. In which case would you expect the car to be more damaged?

(*a*) Case 1

(*b*) Case 2

(*c*) The same damage in each case

SOLUTION

Answer: (*c*) In both cases the car will come to a complete stop, so the applied impulse will be the same.

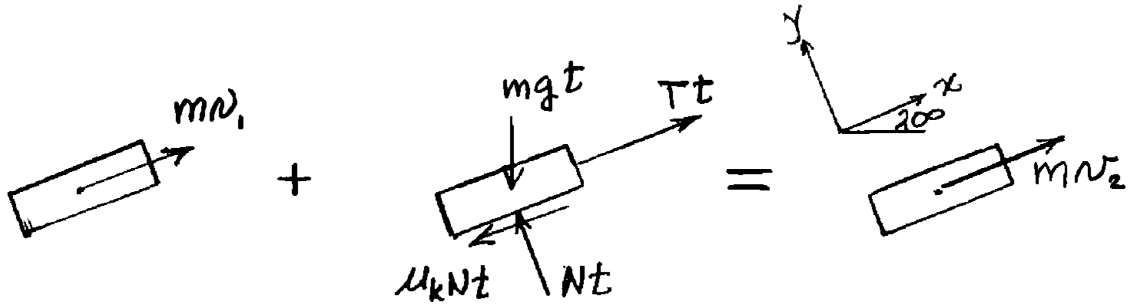
PROBLEM 13.122

A truck is hauling a 300-kg log out of a ditch using a winch attached to the back of the truck. Knowing the winch applies a constant force of 2500 N and the coefficient of kinetic friction between the ground and the log is 0.45, determine the time for the log to reach a speed of 0.5m/s.

SOLUTION

Apply the principle of impulse and momentum to the log.



$$m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$

Components in y-direction:

$$0 + Nt - mgt\cos 20° = 0$$

$$N = mg\cos 20°$$

Components in x-direction:

$$0 + Tt - mgt\sin 20° - \mu_k Nt = mv_2$$

$$(T - mg\sin 20° - \mu_k mg\cos 20°)t = mv_2$$

$$[T - mg(\sin 20° + \mu_k \cos 20°)]t = mv_2$$

Data: $T = 2500$ N, $m = 300$ kg, $\mu_k = 0.45$,

$g = 9.81$ m/s^2, $v_2 = 0.5$ m/s

$$[2500 - (300)(9.81)(\sin 20° + 0.45\cos 20°)]t = (300)(0.5)$$

$$248.95\, t = 150$$

$t = 0.603$ s ◀

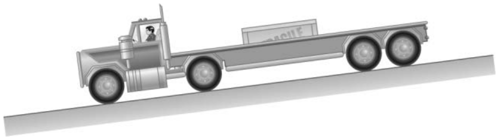
PROBLEM 13.123

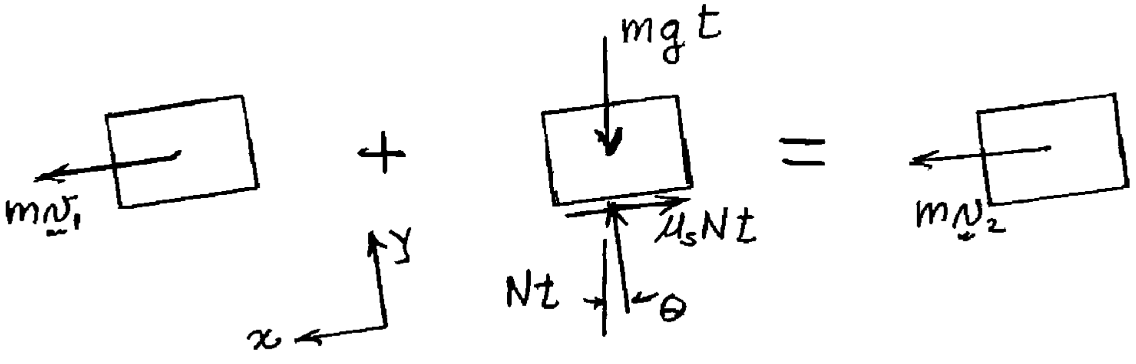


A truck is traveling down a road with a 3-percent grade at a speed of 55 mi/h when the brakes are applied. Knowing the coefficients of friction between the load and the flatbed trailer shown are $\mu_s = 0.40$ and $\mu_k = 0.35$, determine the shortest time in which the rig can be brought to a stop if the load is not to shift.

SOLUTION

Apply the principle impulse-momentum to the crate, knowing that, if the crate does not shift, the velocity of the crate matches that of the truck. For impending slip the friction and normal components of the contact force between the crate and the flatbed trailer satisfy the following equation:

$$F_f = \mu_s N$$



$$m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$

Components in y-direction: $\quad 0 + Nt - mgt\cos\theta = 0$

$$N = mg\cos\theta$$

Components in x-direction: $\quad mv_1 + mgt\sin\theta - \mu_s Nt = mv_2$

$$mv_1 + mgt(\sin\theta - \mu_s\cos\theta) = 0$$

$$t = \frac{v_1}{g(\mu_s\cos\theta - \sin\theta)}$$

Data: $\quad v_1 = 55 \text{ mi/h} = 80.667 \text{ ft/s}, \quad v_2 = 0,$

$$g = 32.2 \text{ ft/s}^2, \quad \mu_s = 0.40, \quad \tan\theta = 3/100$$

$$\theta = 1.71835°$$

$$\mu_s\cos\theta - \sin\theta = 0.36983$$

$$t = \frac{80.667}{(32.2)(0.36983)}$$

$t = 6.77$ s ◀

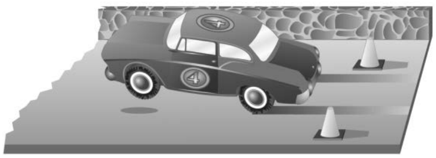
PROBLEM 13.128



Skid marks on a drag race track indicate that the rear (drive) wheels of a car slip for the first 20 m of the 400-m track. (*a*) Knowing that the coefficient of kinetic friction is 0.60, determine the shortest possible time for the car to travel the initial 20-m portion of the track if it starts from rest with its front wheels just off the ground. (*b*) Determine the minimum time for the car to run the whole race if, after skidding for 20 m, the wheels roll without sliding for the remainder of the race. Assume for the rolling portion of the race that 65 percent of the weight is on the rear wheels and that the coefficient of static friction is 0.85. Ignore air resistance and rolling resistance.

SOLUTION

(*a*) First 20 m

Velocity at 20 m. Rear wheels skid to generate the maximum force resulting in maximum velocity and minimum time since all the weight is on the rear wheel: This force is $F = \mu_k N = 0.60W$.

Work and energy. $T_0 + U_{0-20} = T_{20}$

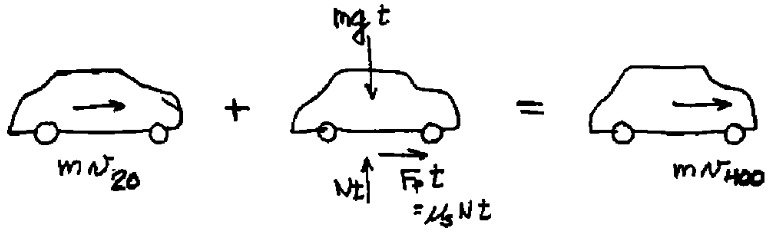
$$T_0 = 0 \qquad U_{0-20} = (F)(20) \qquad T_{20} = \frac{1}{2}mv_{20}^2$$

$$0 + \mu_k mg(20) = \frac{1}{2}mv_{20}^2$$

$$v_{20}^2 = (2)(0.60)(20\text{ m})(9.81\text{ m/s}^2)$$

$$v_{20} = 15.344\text{ m/s}$$

Impulse-momentum.



$$\xrightarrow{+}\ 0 + \mu_k mgt_{0-20} = mv_{20} \qquad v_{20} = 15.344\text{ m/s}$$

$$t_{0-20} = \frac{15.344\text{ m/s}}{(0.60)(9.81\text{ m/s}^2)}$$

$t_{0-20} = 2.61\text{ s}$ ◀

PROBLEM 13.128 (Continued)

(*b*) For the whole race:

The maximum force on the wheels for the first 20 m is $F = \mu_k mg = 0.60mg$. For remaining 360 m, the maximum force, if there is no sliding and 65 percent of the weight is on the rear (drive) wheels, is

$$F = \mu_s (0.65)\, mg = (0.85)(0.65)mg = 0.5525mg$$

Velocity at 400 m.

Work and energy. $$T_0 + U_{0-20} + U_{20-400} = T_{400}$$

$$T_0 = 0 \quad U_{0-20} = (0.60mg)(20\text{ m}), \quad U_{60-400} = (0.5525mg)(380\text{ m})$$

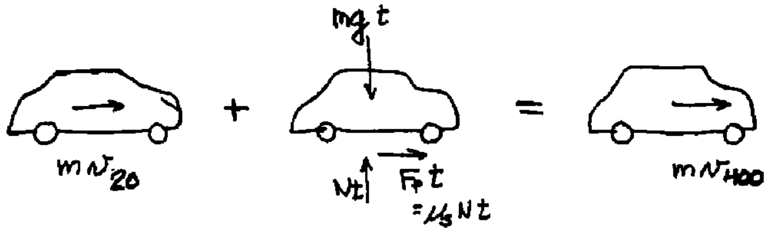
$$T_{400} = \frac{1}{2}mv_{400}^2$$

$$0 + 12mg + (0.5525)(380)mg = \frac{1}{2}mv_{400}^2$$

$$v_{400} = 65.990\text{ m/s}$$

Impulse–momentum.

From 20 m to 400 m



$$F = \mu_s N = 0.510mg$$

$$v_{20} = 15.344\text{ m/s}$$

$$v_{400} = 65.990\text{ m/s}$$

$$m(15.344) + 0.5525mgt_{20-400} = m(65.990); \quad t_{20-400} = 9.3442\text{ s}$$

$$t_{0-400} = t_{0-20} + t_{20-400} = 2.61 + 9.34 \qquad t_{0-400} = 11.95\text{ s} \blacktriangleleft$$

PROBLEM 13.129

The subway train shown is traveling at a speed of 30 mi/h when the brakes are fully applied on the wheels of cars *B* and *C*, causing them to slide on the track, but are not applied on the wheels of car *A*. Knowing that the coefficient of kinetic friction is 0.35 between the wheels and the track, determine (*a*) the time required to bring the train to a stop, (*b*) the force in each coupling.

SOLUTION

Weights of cars: $W_A = W_C = 80{,}000 \text{ lb}, \;\; W_B = 100{,}000 \text{ lb}$

Masses of cars: $m_A = m_C = 2484 \text{ lb} \cdot \text{s}^2/\text{ft}, \;\; m_B = 3106 \text{ lb} \cdot \text{s}^2/\text{ft}$

For each car the normal force (upward) is equal in magnitude to the weight of the car.

$$N_A = N_C = 80{,}000 \text{ lb} \qquad N_B = 100{,}000 \text{ lb}$$

Friction forces: $F_A = 0 \quad$ (brakes not applied)

$$F_B = (0.35)(100{,}000) = 35000 \text{ lb}$$

$$F_C = (0.35)(80{,}000) = 28{,}000 \text{ lb}$$

Stopping data: $v_1 = 30 \text{ mi/h} = 44 \text{ ft/s}, \;\; v_2 = 0.$

(*a*) Apply the principle of impulse-momentum to the entire train.

$$m = m_A + m_B + m_C = 8074 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$F = F_A + F_B + F_C = 63{,}000 \text{ lb}$$

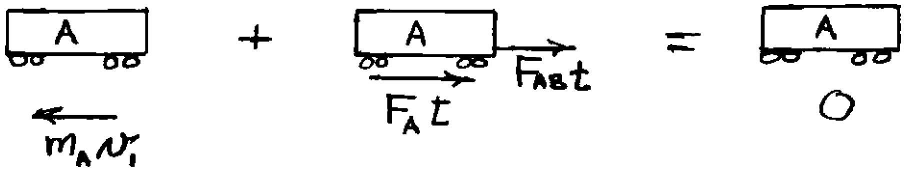
$$-mv_1 + Ft = mv_2$$

$$t = \frac{m(v_1 - v_2)}{F} = \frac{(8074)(44)}{63{,}000} = 5.639 \text{ s}$$

$t = 5.64 \text{ s}$ ◀

(*b*) Coupling force F_{AB}:

Apply the principle of impulse-momentum to car *A* alone.



$$-m_A v_1 + F_A t + F_{AB} t = 0$$

$$-(2484)(44) + 0 + F_{AB}(5.639) = 0$$

$$F_{AB} = 19{,}390 \text{ lb}$$

$F_{AB} = 19{,}390 \text{ lb (tension)}$ ◀

PROBLEM 13.130

Solve Problem 13.129 assuming that the brakes are applied only on the wheels of car *A*.

PROBLEM 13.129 The subway train shown is traveling at a speed of 30 mi/h when the brakes are fully applied on the wheels of cars *B* and *C*, causing them to slide on the track, but are not applied on the wheels of car *A*. Knowing that the coefficient of kinetic friction is 0.35 between the wheels and the track, determine (*a*) the time required to bring the train to a stop, (*b*) the force in each coupling.

SOLUTION

Weights of cars: $W_A = W_C = 80{,}000 \text{ lb}, \; W_B = 100{,}000 \text{ lb}$

Masses of cars: $m_A = m_C = 2484 \text{ lb}\cdot\text{s}^2/\text{ft}, \; m_B = 3106 \text{ lb}\cdot\text{s}^2/\text{ft}$

For each car the normal force (upward) is equal in magnitude to the weight of the car.

$$N_A = N_C = 80{,}000 \text{ lb} \qquad N_B = 100{,}000 \text{ lb}$$

Friction forces: $F_A = (0.35)(80{,}000) = 28{,}000 \text{ lb}$

$$\left.\begin{aligned} F_B &= 0 \\ F_C &= 0 \end{aligned}\right\} \text{(brakes not applied)}$$

Stopping data: $v_1 = 30 \text{ mi/h} = 44 \text{ ft/s}, \quad v_2 = 0.$

(*a*) Apply the principle of impulse-momentum to the entire train.

$$m = m_A + m_B + m_C = 8074 \text{ lb}\cdot\text{s}^2/\text{ft}$$

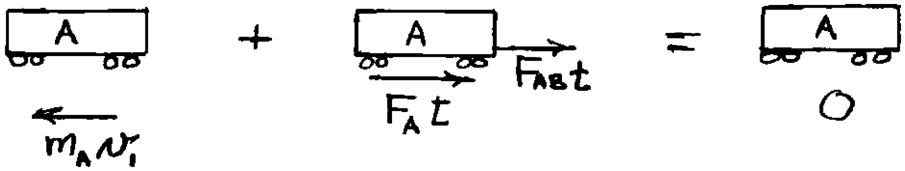
$$F = F_A + F_B + F_C = 28{,}000 \text{ lb}$$

$$-mv_1 + \text{Ft} = mv_2$$

$$t = \frac{m(v_1 - v_2)}{F} = \frac{(8074)(44)}{28{,}000} = 12.688 \text{ s} \qquad t = 12.69 \text{ s} \blacktriangleleft$$

(*b*) Coupling force F_{AB}:

Apply the principle of impulse-momentum to car *A* alone.



$$-m_A v_1 + F_A t + F_{AB} t = 0$$

$$-(2484)(44) + (28{,}000)(12.688) + F_{AB}(12.688) = 0$$

$$F_{AB} = -19{,}390 \text{ lb} \qquad F_{AB} = 19{,}390 \text{ lb (compression)} \blacktriangleleft$$

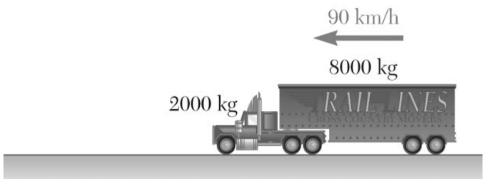
PROBLEM 13.131

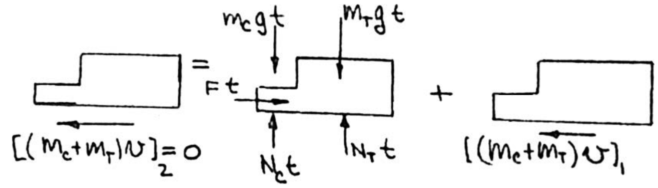


A trailer truck with a 2000-kg cab and an 8000-kg trailer is traveling on a level road at 90 km/h. The brakes on the trailer fail and the antiskid system of the cab provides the largest possible force which will not cause the wheels of the cab to slide. Knowing that the coefficient of static friction is 0.65, determine (*a*) the shortest time for the rig to come to a stop, (*b*) the force in the coupling during that time.

SOLUTION

$$v = 90 \text{ km/h} = 25 \text{ m/s}$$

(*a*) The shortest time for the rig to come to a stop will be when the friction force on the wheels is maximum. The downward force exerted by the trailer on the cab is assumed to be zero. Since the trailer brakes fail, all of the braking force is supplied by the wheels of the cab, which is maximum when the wheels of the cab are at impending sliding.



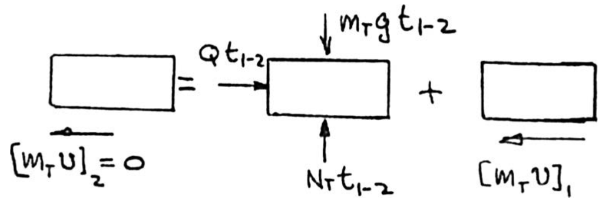
$$Ft_{1-2} = \mu_s N_C t_{1-2} \quad N_C = m_C g = (2000)g$$
$$Ft_{1-2} = (0.65)(2000)gt$$

$$[(m_C + m_T)v]_2 = -Ft + [(m_C + m_T)v]_1$$

$$\xleftarrow{+} \quad 0 = -(0.65)(2000 \text{ kg})(9.81 \text{ m/s}^2)(t_{1-2}) = 10{,}000 \text{ kg}(25 \text{ m/s})$$

$t_{1-2} = 19.60$ s ◀

(*b*) For the trailer:



$$\xleftarrow{+} \quad [m_T v]_2 = -Qt_{1-2} + [m_T v]_1$$

From (*a*), $t_{1-2} = 19.60$ s

$$0 = -Q(19.60 \text{ s}) + (8000 \text{ kg})(25 \text{ m/s})$$
$$Q = 10{,}204 \text{ N}$$

$Q = 10.20$ kN (compression) ◀

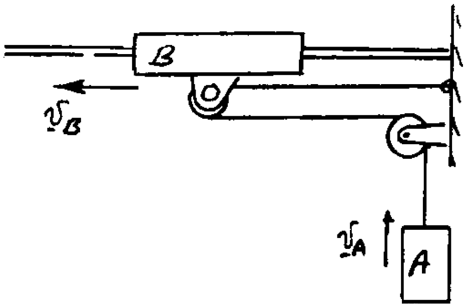
PROBLEM 13.132

The system shown is at rest when a constant 150-N force is applied to collar *B*. Neglecting the effect of friction, determine (*a*) the time at which the velocity of collar *B* will be 2.5 m/s to the left, (*b*) the corresponding tension in the cable.

SOLUTION



Constraint of cord. When the collar *B* moves 1 unit to the left, the weight *A* moves up 2 units. Thus

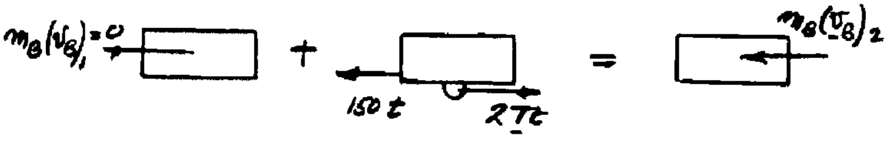
$$v_A = 2v_B \qquad v_B = \frac{1}{2}v_A$$

Masses and weights: $m_A = 3\text{ kg} \qquad W_A = 29.43\text{ N}$

$m_B = 8\text{ kg}$

Let *T* be the tension in the cable.

Principle of impulse and momentum applied to collar *B*.



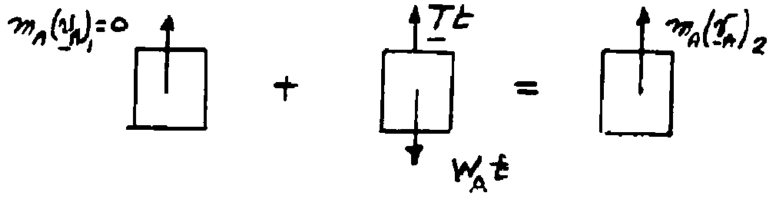
$$\xleftarrow{+}: \; 0 + 150t - 2Tt = m_B(v_B)_2$$

For $(v_B)_2 = 2.5\text{ m/s}$ $\qquad 150t - 2Tt = (8\text{ kg})(2.5\text{ m/s})$

$$150t - 2Tt = 20 \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Principle of impulse and momentum applied to weight A.



$$+\uparrow: \quad 0 + Tt - W_A t = m_A (v_A)_2$$

$$Tt + W_A t = m_A (2V_{B2})$$

$$Tt - 29.43t = (3 \text{ kg})(2)(2.5 \text{ m/s})$$

$$Tt - 29.43t = 15 \qquad (2)$$

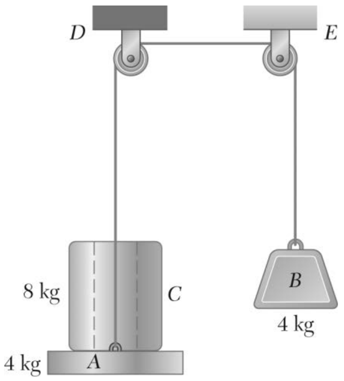
To eliminate T multiply Eq. (2) by 2 and add to Eq. (1).

(*a*) Time: $\quad 91.14t = 50 \quad$ $t = 0.549$ s ◀

From Eq. (2), $\quad T = \dfrac{15}{t} + 29.43$

(*b*) Tension in the cable. $\quad T = 56.8$ N ◀

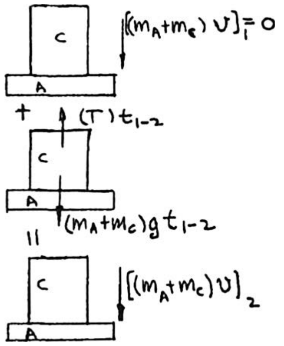
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.133

An 8-kg cylinder C rests on a 4-kg platform A supported by a cord which passes over the pulleys D and E and is attached to a 4-kg block B. Knowing that the system is released from rest, determine (*a*) the velocity of block B after 0.8 s, (*b*) the force exerted by the cylinder on the platform.

SOLUTION



(*a*) Blocks A and C:

$$\downarrow +$$

$$[(m_A + m_C)v]_1 - T(t_{1-2}) + (m_A + m_C)gt_{1-2} = [(m_A + m_C)v]_2$$

$$0 + (12g - T)(0.8) = 12v \qquad (1)$$

Block B:

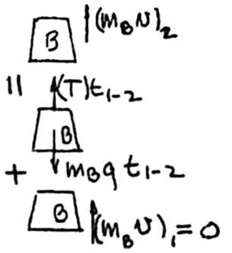
$$\uparrow +$$

$$[m_B v]_1 + (T)t_{1-2} - m_B g t_{1-2} = (m_B v)_2$$

$$0 + (T - 4g)(0.8) = 4v \qquad (2)$$

Adding (1) and (2), (eliminating T)

$$(12g - 4g)(0.8) = (12 + 4)$$



$$v = \frac{(8 \text{ kg})(9.81 \text{ m/s}^2)(0.8 \text{ s})}{16 \text{ kg}} \qquad v = 3.92 \text{ m/s} \blacktriangleleft$$

(*b*) Collar A:

$$\downarrow +$$

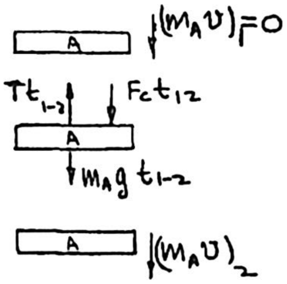
$$(m_A v)_1 = 0 \quad 0 + (F_C + m_A g) \qquad (3)$$

From Eq. (2) with $v = 3.92$ m/s

$$T = \frac{4v}{0.8} + 4g$$

$$T = \frac{(4 \text{ kg})(3.92 \text{ m/s})}{(0.8 \text{ s})} + (4 \text{ kg})(9.81 \text{ m/s}^2)$$

$$T = 58.84 \text{ N}$$

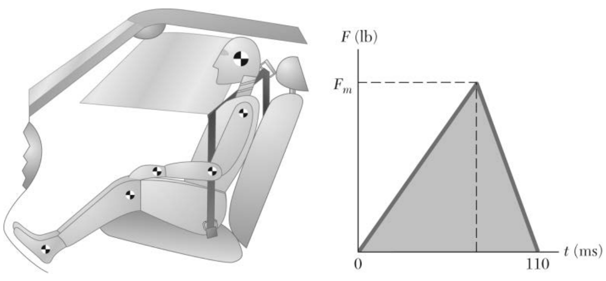


Solving for F_C in (3)

$$F_C = \frac{(4 \text{ kg})(3.92 \text{ m/s})}{(0.8 \text{ s})} - (4 \text{ kg})(9.81 \text{ m/s}^2) + 58.84 \text{ N}$$

$$F_C = 39.2 \text{ N} \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

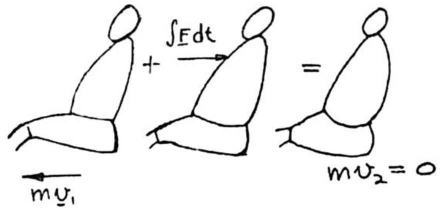


PROBLEM 13.134

An estimate of the expected load on over-the-shoulder seat belts is to be made before designing prototype belts that will be evaluated in automobile crash tests. Assuming that an automobile traveling at 45 mi/h is brought to a stop in 110 ms, determine (*a*) the average impulsive force exerted by a 200-lb man on the belt, (*b*) the maximum force F_m exerted on the belt if the force-time diagram has the shape shown.

SOLUTION

(*a*) Force on the belt is opposite to the direction shown.



$$v_1 = 45 \text{ mi/h} = 66 \text{ ft/s},$$

$$W = 200 \text{ lb}$$

$$m\mathbf{v}_1 - \int \mathbf{F}dt = m\mathbf{v}_2$$

$$\int F dt = F_{\text{ave}}\Delta t$$

$$\Delta t = 0.110 \text{ s}$$

$$\frac{(200 \text{ lb})(66 \text{ ft/s})}{(32.2 \text{ ft/s}^2)} - F_{\text{ave}}(0.110 \text{ s}) = 0$$

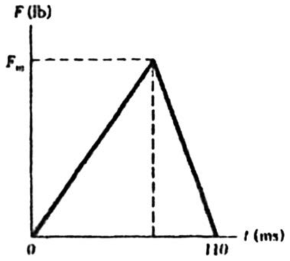
$$F_{\text{ave}} = \frac{(200)(66)}{(32.2)(0.110)} = 3727 \text{ lb}$$

$F_{\text{ave}} = 3730 \text{ lb}$ ◀

(*b*) Impulse = area under $F-t$ diagram $= \frac{1}{2}F_m(0.110 \text{ s})$

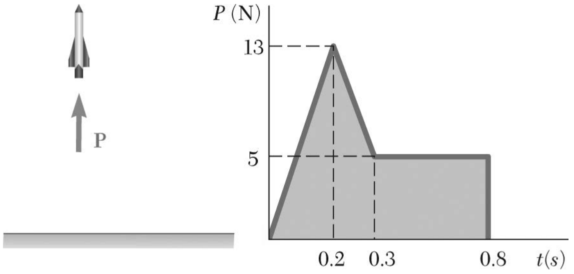
From (*a*), impulse $= F_{\text{ave}}\Delta t = (3727 \text{ lb})(0.110 \text{ s})$

$$\frac{1}{2}F_m(0.110) = (3727)(0.110)$$



$F_m = 7450 \text{ lb}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.135

A 60-g model rocket is fired vertically. The engine applies a thrust **P** which varies in magnitude as shown. Neglecting air resistance and the change in mass of the rocket, determine (*a*) the maximum speed of the rocket as it goes up, (*b*) the time for the rocket to reach its maximum elevation.

SOLUTION

Mass: $m = 0.060$ kg

Weight: $mg = (0.060)(9.81) = 0.5886$ N

Forces acting on the model rocket:

Thrust: $P(t)$(given function of t) $\uparrow$

Weight: W (constant) $\downarrow$

Support: S (acts until $P > W$) $\uparrow$

Over $0 < t < 0.2$ s:

$$P = \frac{13}{0.2}t = 65t$$
$$W = 0.5886 \text{ N}$$

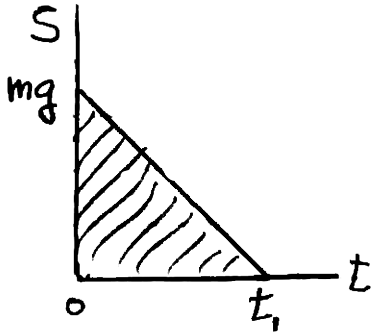
Before the rocket lifts off, $S = W - P = 0.5886 - 65t$

S become zero when $t = t_1$.

$$0 = 0.5886 - 65t_1 \qquad t_1 = 0.009055 \text{ s.}$$

Impulse due to S: $(t > t_1)$

$$\int_0^t S dt = \int_0^{t_1} S dt$$
$$= \frac{1}{2}\, mgt_1$$
$$= (0.5)(0.5886)(0.009055)$$
$$= 0.00266 \text{ N} \cdot \text{s}$$



The maximum speed occurs when $\frac{dv}{dt} = a = 0$.

At this time, $W - P = 0$, which occurs at $t_2 = 0.8$ s.

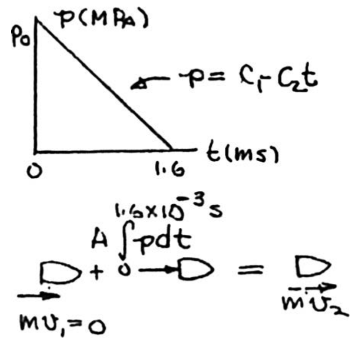
PROBLEM 13.136

A simplified model consisting of a single straight line is to be obtained for the variation of pressure inside the 10-mm-diameter barrel of a rifle as a 20-g bullet is fired. Knowing that it takes 1.6 ms for the bullet to travel the length of the barrel and that the velocity of the bullet upon exit is 700 m/s, determine the value of p_0.

SOLUTION



At $t = 0$,
$$p = p_0 = c_1 - c_2 t$$
$$c_1 = p_0$$

At $t = 1.6\times10^{-3}$ s,
$$p = 0$$
$$0 = c_1 - c_2(1.6\times10^{-3}\,\text{s})$$
$$c_2 = \frac{p_0}{1.6\times10^{-3}\,\text{s}}$$
$$m = 20\times10^{-3}\,\text{kg}$$
$$0 + A\int_0^{1.6\times10^{-3}\,\text{s}} p\,dt = mv_2$$
$$A = \frac{\pi(10\times10^{-3})^2}{4}$$
$$A = 78.54\times10^{-6}\,\text{m}^2$$
$$0 + A\int_0^{1.6\times10^{-3}\,\text{s}} (c_1 - c_2 t)\,dt = \frac{20\times10^{-3}}{g}$$
$$(78.54\times10^{-6}\,\text{m}^2)\left[(c_1)(1.6\times10^{-3}\,\text{s}) - \frac{(c_2)(1.6\times10^{-3}\,\text{s})^2}{2}\right] = (20\times10^{-3}\,\text{kg})(700\,\text{m/s})$$
$$1.6\times10^{-3} c_1 - 1.280\times10^{-6} c_2 = 178.25\times10^3$$
$$(1.6\times10^{-3}\,\text{m}^2\cdot\text{s})p_0 - \frac{(1.280\times10^{-6}\,\text{m}^2\cdot\text{s}^2)}{(1.6\times10^{-3}\,\text{s})}p_0 = 178.25\times10^3\,\text{kg}\cdot\text{m/s}$$
$$p_0 = 222.8\times10^6\,\text{N/m}^2 \qquad p_0 = 223\text{ MPa} \blacktriangleleft$$

PROBLEM 13.138

Solve Problem 13.137, assuming that the weight of the block is 175 lb.

PROBLEM 13.137 A 125-lb block initially at rest is acted upon by a force **P** which varies as shown. Knowing that the coefficients of friction between the block and the horizontal surface are $\mu_s = 0.50$ and $\mu_k = 0.40$, determine (*a*) the time at which the block will start moving, (*b*) the maximum speed reached by the block, (*c*) the time at which the block will stop moving.

SOLUTION

See solution of Problem 13.137.

$$W = 175 \text{ lb} \qquad v = \frac{1}{m}\left[\int P dt - \int F dt\right] \tag{1}$$

(*a*) Block starts moving: $P = F_s = \mu_s W = (0.50)(175) = 87.5 \text{ lb}$

See first figure of Problem 13.137.

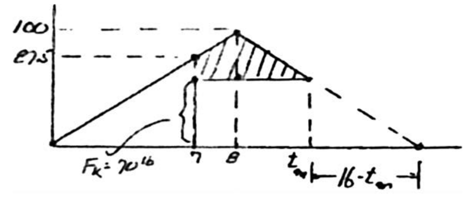
$$\frac{t_1}{F_s} = \frac{8 \text{ s}}{100 \text{ lb}}; \quad \frac{t_1}{87.5 \text{ lb}} = \frac{8 \text{ s}}{100 \text{ s}} \qquad t_1 = 7.00 \text{ s} \blacktriangleleft$$

(*b*) Maximum velocity: $P = F_k = \mu_k W = 0.4(175) = 70 \text{ lb}$

$$\frac{16 - t_m}{70 \text{ lb}} = \frac{8 \text{ s}}{100 \text{ lb}}$$

$$16 - t_m = 70\left(\frac{8}{100}\right) = 5.6$$

$$t_m = 10.40 \text{ s}$$



Eq. (1):

$$v_m = \frac{1}{m}\begin{bmatrix}\text{shaded} \\ \text{area}\end{bmatrix}$$

$$= \frac{1}{m}\left[\frac{1}{2}(17.5 + 30)(1.0) + \frac{1}{2}(30)(10.4 - 8)\right]$$

$$= \frac{1}{m}(59.75)$$

$$v_m = \frac{1}{\frac{175 \text{ lb}}{32.2}}[59.75]$$

$$= 10.994 \text{ ft/s} \qquad \mathbf{v}_m = 10.99 \text{ ft/s} \longrightarrow \blacktriangleleft$$

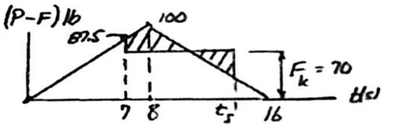
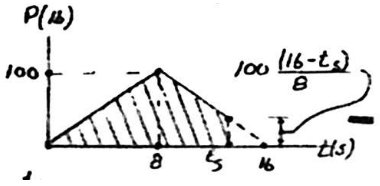
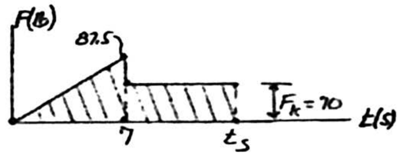
PROBLEM 13.138 (Continued)

(*c*) Block stops moving when net impulse $\left[\int (P-F)dt\right]=0$



Assume $t_s, < 16$ s.





$$\int_0^{t_s} Pdt = \frac{1}{2}(100)(8) + \frac{1}{2}\left[100 + 100\frac{(16-t_s)}{8}\right](t_s - 8)$$
$$= \frac{1}{2}(100)(16) - \frac{1}{2}\left(\frac{100}{8}\right)(16-t_s)^2$$

$$\int_0^{t_s} Fdt = \frac{1}{2}(87.5)(7) + (70)(t_s - 7)$$

$$\int Pdt - \int Fdt = 800 - \frac{100}{16}(16-t_s)^2 - 306.25 - 70(t_s - 7) = 0$$

Solving for t_s, $t_s = 13.492$ s $t_s = 13.49$ s ◀

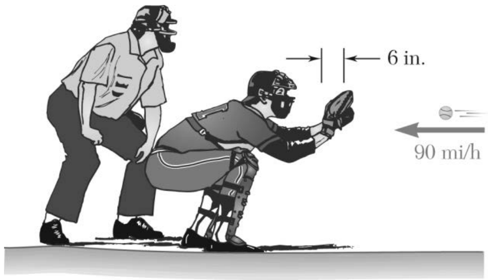
PROBLEM 13.139



A baseball player catching a ball can soften the impact by pulling his hand back. Assuming that a 5-oz ball reaches his glove at 90 mi/h and that the player pulls his hand back during the impact at an average speed of 30 ft/s over a distance of 6 in., bringing the ball to a stop, determine the average impulsive force exerted on the player's hand.

SOLUTION

$$v = 90 \text{ mi/h} = 132 \text{ ft/s}$$

$$m = \frac{5}{16}/\text{g}$$

$$t = \frac{d}{v_{av}} = \frac{\left(\frac{6}{12}\right)}{30} = \left(\frac{1}{60}\right) \text{ s}$$

$$\xrightarrow{+} 0 = F_{av}t + mv \quad F_{av} = \frac{Wv}{gt}$$

$$F_{av} = \frac{mv}{t}$$

$$= \frac{\left(\frac{5}{16}\text{lb}\right)(132 \text{ ft/s})}{(32.2 \text{ ft/s}^2)\left(\frac{1}{60}\text{s}\right)}$$

$F_{av} = 76.9$ lb ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.140

A 1.62 ounce golf ball is hit with a golf club and leaves it with a velocity of 100 mi/h. We assume that for $0 \le t \le t_0$, where t_0 is the duration of the impact, the magnitude F of the force exerted on the ball can be expressed as $F = F_m \sin(\pi t/t_0)$. Knowing that $t_0 = 0.5$ ms, determine the maximum value F_m of the force exerted on the ball.

SOLUTION

$$W = 1.62 \text{ ounces} = 0.10125 \text{ lb} \quad m = 3.1444 \times 10^{-3} \text{ slug}$$

$$t = 0.5 \text{ ms} = 0.5 \times 10^{-3} \text{s}$$

$$v = 100 \text{ mi/h} = 146.67 \text{ ft/s}$$

The impulse applied to the ball is

$$\int_0^{t_0} F dt = \int_0^{t_0} F_m \sin\frac{\pi t}{t_0} dt = -\frac{F_m t_0}{\pi} \cos\frac{\pi t}{t_0}\bigg|_0^{t_0}$$

$$= -\frac{F_m t_0}{\pi}(\cos\pi - \cos 0) = \frac{2F_m t_0}{\pi}$$

Principle of impulse and momentum.

$$m\mathbf{v}_1 + \int_0^{t_0} \mathbf{F}\, dt = m\mathbf{v}_2$$

with $\mathbf{v}_1 = 0$,

$$0 + \frac{2F_m t_0}{\pi} = mv_2$$

Solving for F_m,

$$F_m = \frac{\pi m v_2}{2t_0} = \frac{\pi(3.1444 \times 10^{-3})(146.67)}{(2)(0.5 \times 10^{-3})} = 1.4488 \times 10^3 \text{lb} \qquad F_m = 1.45 \text{ kip} \blacktriangleleft$$

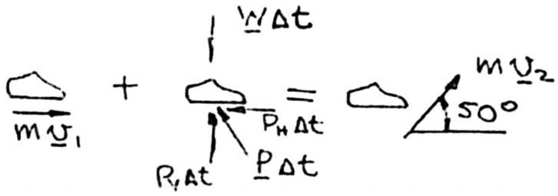
PROBLEM 13.141

The triple jump is a track-and-field event in which an athlete gets a running start and tries to leap as far as he can with a hop, step, and jump. Shown in the figure is the initial hop of the athlete. Assuming that he approaches the takeoff line from the left with a horizontal velocity of 10 m/s, remains in contact with the ground for 0.18 s, and takes off at a 50° angle with a velocity of 12 m/s, determine the vertical component of the average impulsive force exerted by the ground on his foot. Give your answer in terms of the weight *W* of the athlete.

SOLUTION



$$m\mathbf{v}_1 + (\mathbf{P} - \mathbf{W})\Delta t = m\mathbf{v}_2 \qquad \Delta t = 0.18 \text{ s}$$

Vertical components

$$0 + (P_v - W)(0.18) = \frac{W}{g}(12)(\sin 50°)$$

$$P_v = W + \frac{(12)(\sin 50°)}{(9.81)(0.18)}W$$

$$P_v = 6.21W \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. Landing pit

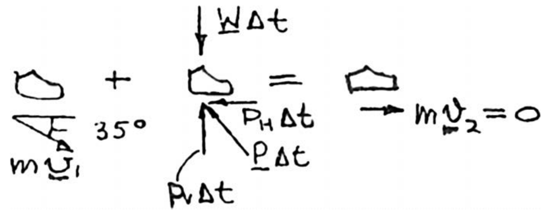
PROBLEM 13.142

The last segment of the triple jump track-and-field event is the jump, in which the athlete makes a final leap, landing in a sand-filled pit. Assuming that the velocity of a 80-kg athlete just before landing is 9 m/s at an angle of 35° with the horizontal and that the athlete comes to a complete stop in 0.22 s after landing, determine the horizontal component of the average impulsive force exerted on his feet during landing.

SOLUTION



$$m = 80\text{ kg}$$
$$\Delta t = 0.22\text{ s}$$

$$m\mathbf{v}_1 + (\mathbf{P} - \mathbf{W})\Delta t = m\mathbf{v}_2$$

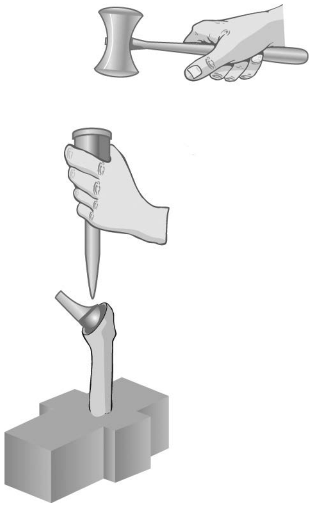
Horizontal components

$$m(9)(\cos 35°) - P_H(0.22) = 0$$

$$P_H = \frac{(80\text{ kg})(9\text{ m/s})(\cos 35°)}{(0.22\text{ s})} = 2.6809\text{ kN} \qquad P_H = 2.68\text{ kN} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.143



The design for a new cementless hip implant is to be studied using an instrumented implant and a fixed simulated femur. Assuming the punch applies an average force of 2 kN over a time of 2 ms to the 200 g implant determine (*a*) the velocity of the implant immediately after impact, (*b*) the average resistance of the implant to penetration if the implant moves 1 mm before coming to rest.

SOLUTION

$$m = 200 \text{ g} = 0.200 \text{ kg}$$
$$F_{\text{ave}} = 2 \text{ kN} = 2000 \text{ N}$$
$$\Delta t = 2 \text{ ms} = 0.002 \text{ s}$$

(*a*) Velocity immediately after impact:

Use principle of impulse and momentum:

$$v_1 = 0 \qquad v_2 = ? \qquad \text{Imp}_{1\to 2} = F_{\text{ave}}(\Delta t)$$
$$m\mathbf{v}_1 + \mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$
$$0 + F_{\text{ave}}(\Delta t) = mv_2$$
$$v_2 = \frac{F_{\text{ave}}(\Delta t)}{m} = \frac{(2000)(0.002)}{0.200}$$

$v_2 = 20.0$ m/s ◀

(*b*) Average resistance to penetration:

$$\Delta x = 1 \text{ mm} = 0.001 \text{ m}$$
$$v_2 = 20.0 \text{ ft/s}$$
$$v_3 = 0$$

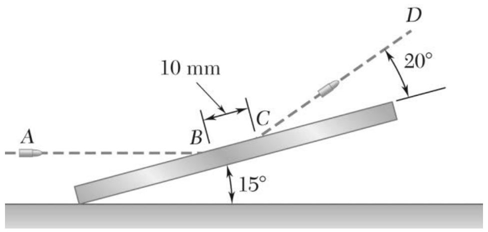
Use principle of work and energy.

$$T_2 + U_{2\to 3} = T_3 \qquad \text{or} \qquad \frac{1}{2}mv_2^2 - R_{\text{ave}}(\Delta x) = 0$$
$$R_{\text{ave}} = \frac{mv_2^2}{2(\Delta x)} = \frac{(0.200)(20.0)^2}{(2)(0.001)} = 40\times 10^3 \text{ N}$$

$R_{\text{ave}} = 40.0$ kN ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.144

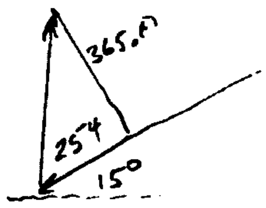


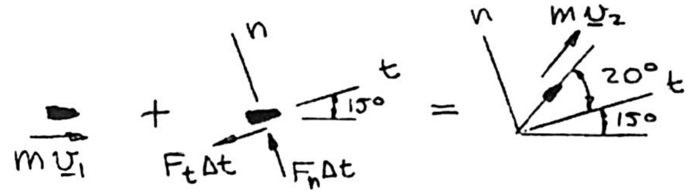
A 25-g steel-jacketed bullet is fired horizontally with a velocity of 600 m/s and ricochets off a steel plate along the path *CD* with a velocity of 400 m/s. Knowing that the bullet leaves a 10-mm scratch on the plate and assuming that its average speed is 500 m/s while it is in contact with the plate, determine the magnitude and direction of the average impulsive force exerted by the bullet on the plate.

SOLUTION

Impulse and momentum.

Bullet alone:





$$m\mathbf{v}_1 + \mathbf{F}\,\Delta t = m\mathbf{v}_2$$

t direction: $mv_1 \cos 15° - F_t \Delta t = mv_2 \cos 20°$

$$\nearrow + \; \mathbf{F}_t \Delta t = (0.025 \text{ kg})[600 \text{ m/s} \cos 15° - 400 \text{ m/s} \cos 20°] = 5.092 \text{ kg} \cdot \text{m/s}$$

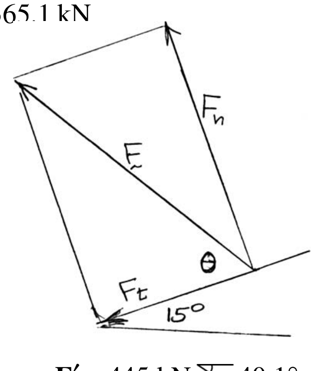
$$\Delta t = \frac{S_{BC}}{v_{AV}} = \frac{0.010 \text{ m}}{500 \text{ m/s}} = 20 \times 10^{-6} \text{ s}$$

$$\mathbf{F}_t = (5.092 \text{ kg} \cdot \text{m/s})/(20 \times 10^{-6} \text{ s}) = 254.6 \times 10^3 \text{ kg} \cdot \text{m/s}^2 = 254.6 \text{ kN}$$

n direction: $\nwarrow^{+} \; -mv_1 \sin 15° + F_n \Delta t = mv_2 \sin 20°$

$$\mathbf{F}_n \Delta t = (0.025 \text{ kg})[600 \text{ m/s} \sin 15° + 400 \text{ m/s} \sin 20°] = 7.3025 \text{ kg} \cdot \text{m/s}$$

$$\mathbf{F}_n = (43025 \text{ kg} \cdot \text{m/s})/(20 \times 10^{-6}) = 365.1 \times 10^3 \text{ kg} \cdot \text{m/s}^2 = 365.1 \text{ kN}$$



Force on bullet: $F = \sqrt{F_n^2 + F_t^2} = \sqrt{365.1^2 + 254.6^2} = 445 \text{ kN}$

$$\tan\theta = \frac{F_n}{F_t} = \frac{365.1}{254.6} \qquad \theta = 55.1°$$

$$\theta - 15° = 40.1°$$

$$\mathbf{F} = 445 \text{ kN} \searrow 40.1°$$

Force on plate: $\mathbf{F}' = -\mathbf{F}$

$\mathbf{F}' = 445 \text{ kN} \nwarrow 40.1°$ ◀

PROBLEM 13.145

A 25-ton railroad car moving at 2.5 mi/h is to be coupled to a 50 ton car which is at rest with locked wheels ($\mu_k = 0.30$). Determine (*a*) the velocity of both cars after the coupling is completed, (*b*) the time it takes for both cars to come to rest.

SOLUTION

Weight and mass: (Label cars *A* and *B*.)

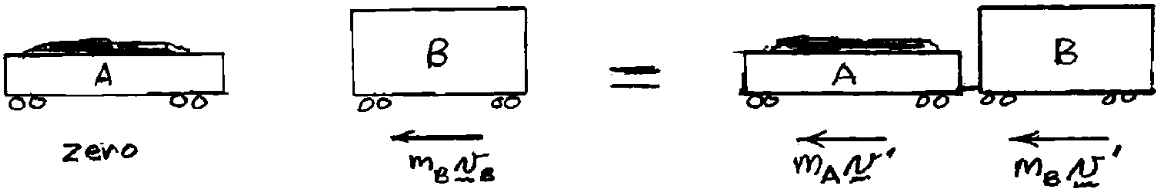
$$\text{Car } A: \quad W_A = 50 \text{ tons} = 100{,}000 \text{ lb}, \quad m_A = 3106 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\text{Car } B: \quad W_B = 25 \text{ tons} = 50{,}000 \text{ lb}, \quad m_B = 1553 \text{ lb}\cdot\text{s}^2/\text{ft}$$

Initital velocities: $\quad \mathbf{v}_A = 0$

$$v_B = 2.5 \text{ mi/h} = 3.6667 \text{ ft/s} \qquad \mathbf{v}_B = 3.6667 \text{ ft/s} \longleftarrow$$

(*a*) The momentum of the system consisting of the two cars is conserved immediately before and after coupling.



Let $\mathbf{v}'$ be the common velocity of that cars immediately after coupling. Apply conservation of momentum.

$$+\longleftarrow: \; m_B v_B = m_A v' + m_B v'$$

$$v' = \frac{m_B v_B}{m_A + m_B} = \frac{(3106)(3.6667)}{4569} = 2.444 \text{ ft/s} \qquad \mathbf{v}' = 1.667 \text{ mi/h} \longleftarrow \blacktriangleleft$$

(*b*) After coupling: The friction force acts only on car *A*.

$$+\uparrow \Sigma F = 0_A: \quad N_A - W_A = 0 \qquad N_A = W_A$$

$$F_A = \mu_k N_A = \mu_k W_A \quad \text{(sliding)}$$

$$F_B = 0 \quad (\text{Car } B \text{ is rolling.})$$

Apply impuslse-momentum to the coupled cars.

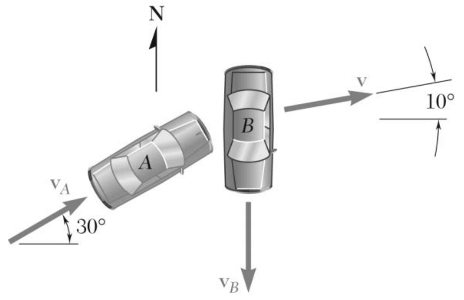
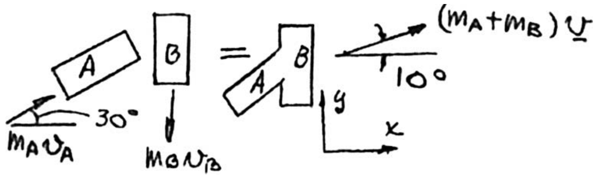
PROBLEM 13.146



At an intersection car B was traveling south and car A was traveling 30° north of east when they slammed into each other. Upon investigation it was found that after the crash the two cars got stuck and skidded off at an angle of 10° north of east. Each driver claimed that he was going at the speed limit of 50 km/h and that he tried to slow down but couldn't avoid the crash because the other driver was going a lot faster. Knowing that the masses of cars A and B were 1500 kg and 1200 kg, respectively, determine (a) which car was going faster, (b) the speed of the faster of the two cars if the slower car was traveling at the speed limit.

SOLUTION

(a) Total momentum of the two cars is conserved.



$$\Sigma mv,\ x: \qquad m_A v_A \cos 30° = (m_A + m_B) v \cos 10° \qquad (1)$$

$$\Sigma mv,\ y: \qquad m_A v_A \sin 30° - m_B v_B = (m_A + m_B) v \sin 10° \qquad (2)$$

Dividing (1) into (2),

$$\frac{\sin 30°}{\cos 30°} - \frac{m_B v_B}{m_A v_A \cos 30°} = \frac{\sin 10°}{\cos 10°}$$

$$\frac{v_B}{v_A} = \frac{(\tan 30° - \tan 10°)(m_A \cos 30°)}{m_B}$$

$$\frac{v_B}{v_A} = (0.4010)\frac{(1500)}{(1200)}\cos 30°$$

$$\frac{v_B}{v_A} = 0.434 \qquad v_A = 2.30\, v_B$$

Thus, A was going faster. ◀

(b) Since v_B was the slower car.

$$v_B = 50 \text{ km/h}$$

$$v_A = (2.30)(50) \qquad v_A = 115.2 \text{ km/h} \ ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.147

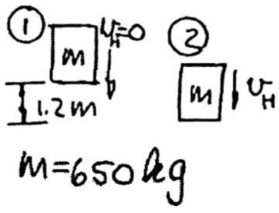
The 650-kg hammer of a drop-hammer pile driver falls from a height of 1.2 m onto the top of a 140-kg pile, driving it 110 mm into the ground. Assuming perfectly plastic impact $(e = 0)$, determine the average resistance of the ground to penetration.

SOLUTION

Velocity of the hammer at impact:

Conservation of energy.



$$T_1 = 0$$

$$V_H = mg\ (1.2 \text{ m})$$

$$V_H = (650 \text{ kg})(9.81 \text{ m/s}^2)(1.2 \text{ m})$$

$$V_1 = 7652 \text{ J}$$

$$T_2 = \frac{1}{2}m$$

$$V_H^2 = \frac{650}{2}v^2 = 325 v_H^2$$

$$V_2 = 0$$

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 7652 = 325 v^2$$

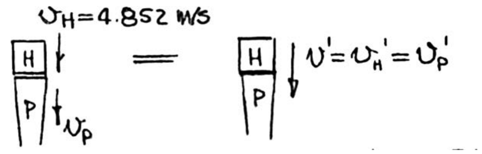
$$v^2 = 23.54 \text{ m}^2/\text{s}^2$$

$$v = 4.852 \text{ m/s}$$

Velocity of pile after impact:

Since the impact is plastic $(e = 0)$, the velocity of the pile and hammer are the same after impact.

Conservation of momentum:



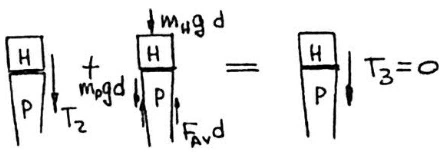
The ground reaction and the weights are non-impulsive.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Thus, $$m_H v_H = (m_H + m_p)v'$$

$$v' = \frac{m_H v_H}{(m_H + m_p)} = \frac{(650)}{(650+140)}(4.852 \text{ m/s}) = 3.992 \text{ m/s}$$

Work and energy: $$d = 0.110 \text{ m}$$



$$T_2 + U_{2-3} = T_3$$

$$T_2 = \frac{1}{2}(m_H + m_H)(v')^2$$

$$T_3 = 0$$

$$T_2 = \frac{1}{2}(650+140)(3.992)^2$$

$$T_2 = 6.295\times 10^3 \text{ J}$$

$$U_{2-3} = (m_H + m_p)gd - F_{AV}d$$
$$= (650+140)(9.81)(0.110) - F_{AV}(0.110)$$
$$U_{2-3} = 852.49 - (0.110)F_{AV}$$

$$T_2 + U_{2-3} = T_3$$

$$6.295\times 10^3 + 852.49 - (0.110)F_{AV} = 0$$

$$F_{AV} = (7147.5)/(0.110) = 64.98\times 10^3 \text{ N}$$ $$F_{AV} = 65.0 \text{ kN}$$ ◀

PROBLEM 13.148

A small rivet connecting two pieces of sheet metal is being clinched by hammering. Determine the impulse exerted on the rivet and the energy absorbed by the rivet under each blow, knowing that the head of the hammer has a weight of 1.5 lbs and that it strikes the rivet with a velocity of 20 ft/s. Assume that the hammer does not rebound and that the anvil is supported by springs and (*a*) has an infinite mass (rigid support), (*b*) has a weight of 9 lb.

SOLUTION

Weight and mass:

$$\text{Hammer:}\quad W_H = 1.5 \text{ lb} \qquad m_H = 0.04658 \text{ lb}\cdot\text{s}^2/\text{ft}$$

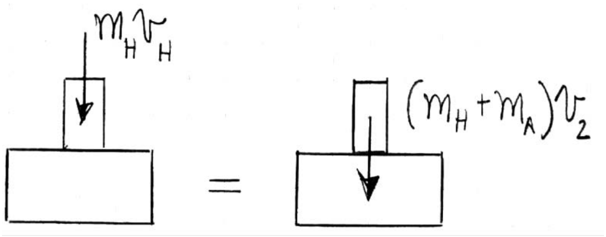
$$\text{Anvil:}\quad \text{Part } a\text{: } W_A = \infty \qquad m_A = \infty$$

$$\text{Part } b\text{: } W_A = 9 \text{ lb} \qquad m_A = 0.2795 \text{ lb}\cdot\text{s}^2/\text{ft}$$

Kinetic energy before impact:

$$T_1 = \frac{1}{2} m_H v_H^2 = \frac{1}{2}(0.04658)(20)^2 = 9.316 \text{ ft}\cdot\text{lb}$$

Let v_2 be the velocity common to the hammer and anvil immediately after impact. Apply the principle of conservation of momentum to the hammer and anvil over the duration of the impact.



$$+\downarrow: \Sigma m v_1 = \Sigma m v_2$$

$$m_H v_H = (m_H + m_A) v_2$$

$$v_2 = \frac{m_H v_H}{m_H + m_A} \tag{1}$$

Kinetic energy after impact:

$$T_A = \frac{1}{2}(m_H + m_A)v_2^2 = \frac{1}{2}\frac{m_H^2 v_H^2}{m_H + m_A}$$

$$T_2 = \frac{m_H}{m_H + m_A} T_1 \tag{2}$$

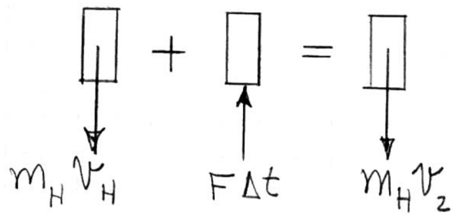
Impulse exerted on the hammer:



$$+\downarrow: m_H v_H - F(\Delta t) = m_H v_2$$

$$F\Delta t = m_H(v_H - v_2) \quad (3)$$

(*a*) $W_A = \infty$:

By Eq. (1), $v_2 = 0$

By Eq. (2), $T_2 = 0$

Energy absorbed: $T_1 - T_2 = 9.32 \text{ ft} \cdot \text{lb}$ ◀

By Eq. (3), $F(\Delta t) = (0.04658)(20 - 0) = 0.932 \text{ lb} \cdot \text{s}$

The impulse exerted on the rivet the same magnitude but opposite to direction.

$F\Delta t = 0.932 \text{ lb} \cdot \text{s}$ ◀

(*b*) $W_A = 9$ lb:

By Eq. (1), $v_2 = \dfrac{(0.04658)(20)}{0.32608} = 2.857 \text{ ft/s}$

By Eq. (2), $T_2 = \dfrac{(0.04658)(9.316)}{0.32608} = 1.331 \text{ ft} \cdot \text{lb}$

Energy absorbed: $T_1 - T_2 = 7.99 \text{ ft} \cdot \text{lb}$ ◀

By Eq. (3), $F(\Delta t) = (0.04658)(20 - 2.857)$ $F(\Delta t) = 0.799 \text{ lb} \cdot \text{s}$ ◀

PROBLEM 13.149

Bullet B weighs 0.5 oz and blocks A and C both weigh 3 lb. The coefficient of friction between the blocks and the plane is $\mu_k = 0.25$. Initially the bullet is moving at v_0 and blocks A and C are at rest (Figure 1). After the bullet passes through A it becomes embedded in block C and all three objects come to stop in the positions shown (Figure 2). Determine the initial speed of the bullet v_0.

SOLUTION

Masses:

Bullet: $$m_B = \frac{0.5}{(16)(32.2)} = 970.5\times 10^{-6}\,\text{lb}\cdot\text{s}^2/\text{ft}$$

Blocks A and C: $$m_A = m_C = \frac{3}{32.2} = 93.168\times 10^{-3}\,\text{lb}\cdot\text{s}^2/\text{ft}$$

Block C + bullet: $$m_C + m_B = 94.138\times 10^{-3}\,\text{lb}\cdot\text{s}^2/\text{ft}$$

Normal forces for sliding blocks from $N - mg = 0$

Block A: $$N_A = m_A\, g = 3.00 \text{ lb.}$$

Block C + bullet: $$N_C = (m_C + m_B)g = 3.03125 \text{ lb.}$$

Let v_0 be the initial speed of the bullet;

v_1 be the speed of the bullet after it passes through block A;

v_A be the speed of block A immediately after the bullet passes through it;

v_C be the speed block C immediately after the bullet becomes embedded in it.

Four separate processes and their governing equations are described below.

1. The bullet hits block A and passes through it. Use the principle of conservation of momentum.

$$(v_A)_0 = 0$$

$$m_B v_0 + m_A (v_A)_0 = m_B v_1 + m_A v_A$$

$$v_0 = v_1 + \frac{m_A v_A}{m_B} \tag{1}$$

2. The bullet hits block C and becomes embedded in it. Use the principle of conservation of momentum.

$$(v_C)_0 = 0$$

$$m_B v_1 + m_C (v_C)_0 = (m_B + m_C) v_C$$

$$v_1 = \frac{(m_B + m_C) v_C}{m_B} \tag{2}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.149 (Continued)

3. Block A slides on the plane. Use principle of work and energy.

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}m_A v_A^2 - \mu_k N_A d_A = 0 \quad \text{or} \quad v_A = \sqrt{\frac{2\mu_k N_A d_A}{m_A}} \tag{3}$$

4. Block C with embedded bullet slides on the plane. Use principle of work and energy.

$$d_C = 4 \text{ in.} = 0.33333 \text{ ft}$$

$$T_1 + U_{1\to 2} = T_2$$

$$\frac{1}{2}(m_C + m_B)v_C^2 - \mu_k N_C d_C = 0 \quad \text{or} \quad v_C = \sqrt{\frac{2\mu_k N_C d_C}{m_C + m_B}} \tag{4}$$

Applying the numerical data:

From Eq. (4),
$$v_C = \sqrt{\frac{(2)(0.25)(3.03125)(0.33333)}{94.138\times 10^{-3}}}$$
$$= 2.3166 \text{ ft/s}$$

From Eq. (3),
$$v_A = \sqrt{\frac{(2)(0.25)(3.00)(0.5)}{93.168\times 10^{-3}}}$$
$$= 2.8372 \text{ ft/s}$$

From Eq. (2),
$$v_1 = \frac{(94.138\times 10^{-3})(2.3166)}{970.5\times 10^{-6}}$$
$$= 224.71 \text{ ft/s}$$

From Eq. (1),
$$v_0 = 224.71 + \frac{(93.138\times 10^{-3})(2.8372)}{970.5\times 10^{-6}}$$

$v_0 = 497$ ft/s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.150

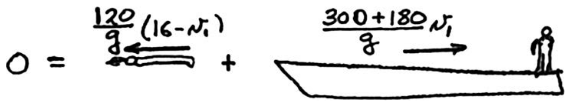
A 180-lb man and a 120-lb woman stand at opposite ends of a 300-lb boat, ready to dive, each with a 16-ft/s velocity relative to the boat. Determine the velocity of the boat after they have both dived, if (*a*) the woman dives first, (*b*) the man dives first.

SOLUTION

(*a*) Woman dives first:

Conservation of momentum:



$$-\frac{120}{g}(16-v_1)+\frac{300+180}{g}v_1=0$$

$$v_1=\frac{(120)(16)}{600}=3.20 \text{ ft/s} \longrightarrow$$

Man dives next. Conservation of momentum:

$$\frac{300+180}{g}v_1=-\frac{300}{g}v_2+\frac{180}{g}(16-v_2)$$

$$v_2=\frac{480v_1-(180)(16)}{480}=2.80 \text{ ft/s} \qquad \mathbf{v}_2=2.80 \text{ ft/s} \longleftarrow \blacktriangleleft$$

(*b*) Man dives first:

Conservation of momentum:

$$\frac{180}{g}(16-v_1')-\frac{300+120}{g}v_1'=0$$

$$v_1'=\frac{(180)(16)}{600}=4.80 \text{ ft/s} \longleftarrow$$

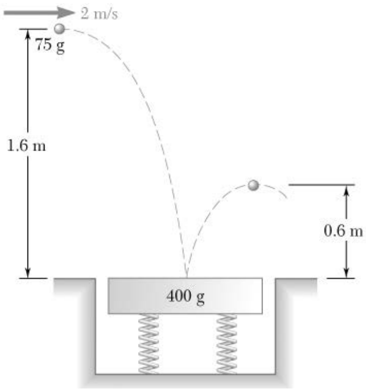
Woman dives next. Conservation of momentum:

$$-\frac{300+120}{g}v_1'=\frac{300}{g}v_2'+\frac{120}{g}(16-v_2')$$

$$v_2'=\frac{-420v_1'+(120)(16)}{420}=-0.229 \text{ ft/s}$$

$$\mathbf{v}_2'=0.229 \text{ ft/s} \longleftarrow \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

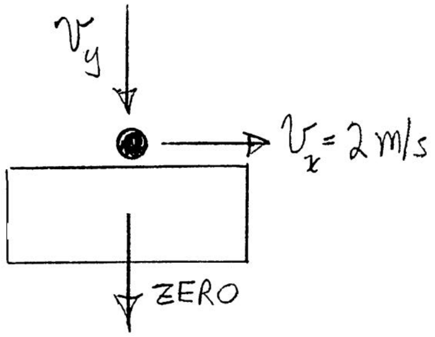


PROBLEM 13.151

A 75-g ball is projected from a height of 1.6 m with a horizontal velocity of 2 m/s and bounces from a 400-g smooth plate supported by springs. Knowing that the height of the rebound is 0.6 m, determine (*a*) the velocity of the plate immediately after the impact, (*b*) the energy lost due to the impact.

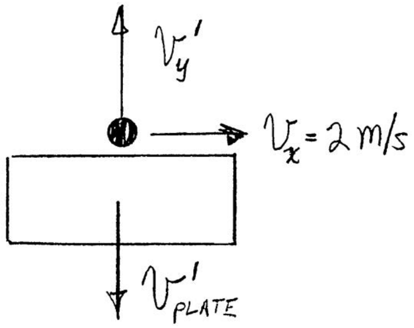
SOLUTION

Just before impact



$$v_y = \sqrt{2g(1.6)} = 5.603 \text{ m/s}$$

Just after impact



$$v_y = \sqrt{2g\,(0.6)} = 3.431 \text{ m/s}$$

(*a*) Conservation of momentum: $(+y\downarrow)$

$$m_{\text{ball}}v_y + 0 = -m_{\text{ball}}v_y' + m_{\text{plate}}v_{\text{plate}}'$$

$$(0.075)(5.603) + 0 = -0.075(3.431) + 0.4v_{\text{plate}}'$$

$$v_{\text{plate}}' = 1.694 \text{ m/s} \downarrow \blacktriangleleft$$

(*b*) Energy loss

Initial energy $$(T+V)_1 = \frac{1}{2}(0.075)(2)^2 + 0.075g(1.6)$$

Final energy $$(T+V)_2 = \frac{1}{2}(0.075)(2)^2 + 0.075g(0.6) + \frac{1}{2}(0.4)(1.694)^2$$

$$\text{Energy lost} = (1.3272 - 1.1653)\text{ J} = 0.1619\text{ J} \blacktriangleleft$$

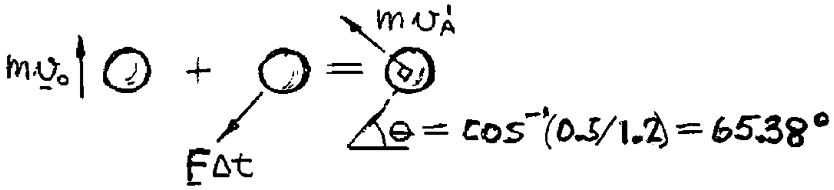
PROBLEM 13.152

A 2-kg sphere A is connected to a fixed Point O by an inextensible cord of length 1.2 m. The sphere is resting on a frictionless horizontal surface at a distance of 1.5 ft from O when it is given a velocity $\mathbf{v}_0$ in a direction perpendicular to line OA. It moves freely until it reaches position A', when the cord becomes taut. Determine the maximum allowable velocity $\mathbf{v}_0$ if the impulse of the force exerted on the cord is not to exceed 3 N·s.

SOLUTION

For the sphere at A' immediately before and after the cord becomes taut



$$mv_0 + F\Delta t = mv_{A'}$$

$$\nearrow\!\theta^{+} \quad mv_0 \sin\theta - F\Delta t = 0 \qquad F\Delta t = 3\ \text{N}\cdot\text{s}$$

$$m = 2\ \text{kg}$$

$$2(\sin 65.38°)v_0 = 3$$

$$v_0 = 1.650\ \text{m/s} \blacktriangleleft$$

PROBLEM 13.153

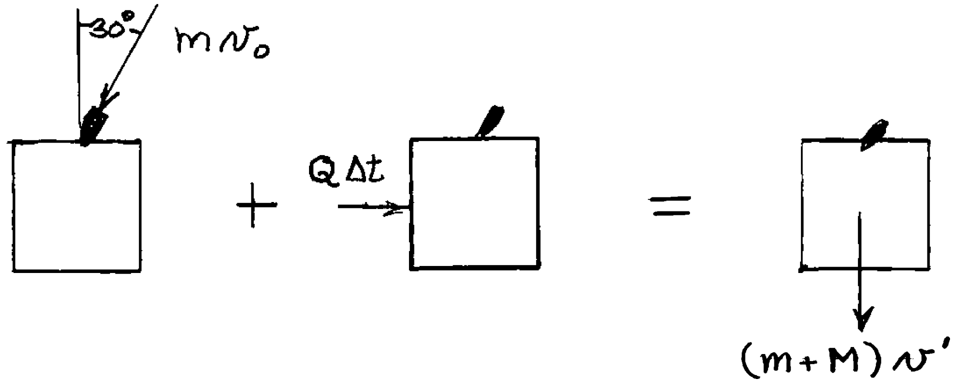
A 1-oz bullet is traveling with a velocity of 1400 ft/s when it impacts and becomes embedded in a 5-lb wooden block. The block can move vertically without friction. Determine (*a*) the velocity of the bullet and block immediately after the impact, (*b*) the horizontal and vertical components of the impulse exerted by the block on the bullet.

SOLUTION

Weight and mass. Bullet: $w = 1 \text{ oz} = \frac{1}{16} \text{ lb} \qquad m = 0.001941 \text{ lb} \cdot \text{s}^2/\text{ft.}$

Block: $W = 5 \text{ lb} \qquad M = 0.15528 \text{ lb} \cdot \text{s}^2/\text{ft.}$

(*a*) Use the principle of impulse and momentum applied to the bullet and the block together.



$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = m\mathbf{v}_2$$

Components $\downarrow$: $\qquad mv_0 \cos 30° + 0 = (m + M)v'$

$$v' = \frac{mv_0 \cos 30°}{m+M} = \frac{(0.001941)(1400)\cos 30°}{0.157221}$$

$$v' = 14.968 \text{ ft/s}$$

$\mathbf{v}' = 14.97 \text{ ft/s} \downarrow$ ◀

PROBLEM 13.154

In order to test the resistance of a chain to impact, the chain is suspended from a 240-lb rigid beam supported by two columns. A rod attached to the last link is then hit by a 60-lb block dropped from a 5-ft height. Determine the initial impulse exerted on the chain and the energy absorbed by the chain, assuming that the block does not rebound from the rod and that the columns supporting the beam are (*a*) perfectly rigid, (*b*) equivalent to two perfectly elastic springs.

SOLUTION

Velocity of the block just before impact:

$$T_1 = 0 \qquad V_1 = Wh = (60\text{ lb})(5\text{ ft}) = 300\text{ lb}\cdot\text{ft}$$

$$T_2 = \frac{1}{2}mv^2 \quad V_2 = 0$$

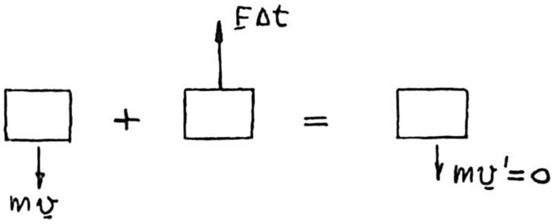
$$T_1 + V_1 = T_2 + V_2$$

$$0 + 300 = \frac{1}{2}\left(\frac{60}{g}\right)v^2$$

$$v = \sqrt{\frac{(600)(32.2)}{60}}$$

$$= 17.94\text{ ft/s}$$

(*a*) Rigid columns:



$$+\!\uparrow\; -mv + F\Delta t = 0 \qquad \left(\frac{60}{g}\right)(17.94) = F\Delta t$$

$$F\Delta t = 33.43\text{ lb}\cdot\text{s}\uparrow \text{on the block.} \qquad F\Delta t = 33.4\text{ lb}\cdot\text{s} \blacktriangleleft$$

All of the kinetic energy of the block is absorbed by the chain.

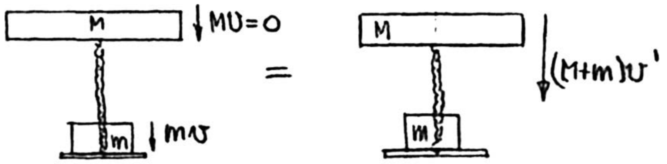
$$T = \frac{1}{2}\left(\frac{60}{g}\right)(17.94)^2$$

$$= 300\text{ ft}\cdot\text{lb} \qquad E = 300\text{ ft}\cdot\text{lb} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) Elastic columns:

Momentum of system of block and beam is conserved.



$$mv = (M + m)v'$$

$$v' = \frac{m}{(m+M)}v = \frac{60}{300}(17.94 \text{ ft/s})$$ $v' = 3.59$ ft/s

Referring to figure in part (*a*),

$$-mv + F\Delta t = -mv'$$

$$F\Delta t = m(v - v')$$

$$= \left(\frac{60}{g}\right)(17.94 - 3.59)$$ $F\Delta t = 26.7$ lb·s ◀

$$E = \frac{1}{2}mv^2 - \frac{1}{2}mv'^2 - \frac{1}{2}Mv'^2$$

$$= \frac{60}{2g}[(17.94)^2 - (3.59)^2] - \frac{240}{2g}(3.59)^2$$ $E = 240$ ft·lb ◀

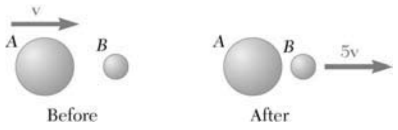
PROBLEM 13.CQ6



A 5 kg ball *A* strikes a 1 kg ball *B* that is initially at rest. Is it possible that after the impact *A* is not moving and *B* has a speed of 5*v*?

(*a*) Yes

(*b*) No

Explain your answer.

SOLUTION

Answer: (*b*) No.

Conservation of momentum is satisfied, but the coefficient of restitution equation is not. The coefficient of restitution must be less than 1.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.155

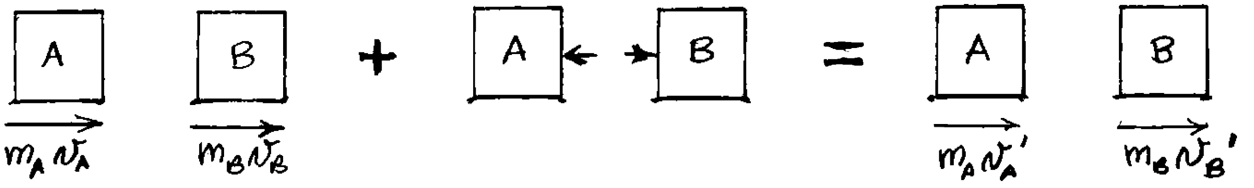
The coefficient of restitution between the two collars is known to be 0.70. Determine (*a*) their velocities after impact, (*b*) the energy loss during impact.

SOLUTION

Impulse-momentum principle (collars *A* and *B*):

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



Horizontal components $\xrightarrow{+}$: $m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$

Using data, $(5)(1) + (3)(-1.5) = 5v_A' + 3v_B'$

or $5v_A' + 3v_B' = 0.5$ (1)

Apply coefficient of restitution.

$$v_B' - v_A' = e(v_A - v_B)$$
$$v_B' - v_A' = 0.70[1 - (-0.5)]$$
$$v_B' - v_A' = 1.75 \quad (2)$$

(*a*) Solving Eqs. (1) and (2) simultaneously for the velocities,

$v_A' = -0.59375$ m/s $\qquad \mathbf{v}_A = 0.594 \text{ m/s} \longleftarrow$ ◀

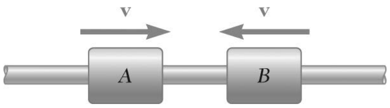
$v_B' = 1.15625$ m/s $\qquad \mathbf{v}_B = 1.156 \text{ m/s} \longrightarrow$ ◀

Kinetic energies: $T_1 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 = \frac{1}{2}(5)(1)^2 + \frac{1}{2}(3)(-1.5)^2 = 5.875 \text{ J}$

$$T_2 = \frac{1}{2}m_A(v_A')^2 + \frac{1}{2}m_B(v_B')^2 = \frac{1}{2}(5)(-0.59375)^2 + \frac{1}{2}(3)(1.15625)^2 = 2.8867 \text{ J}$$

(*b*) Energy loss: $T_1 - T_2 = 2.99 \text{ J}$ ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



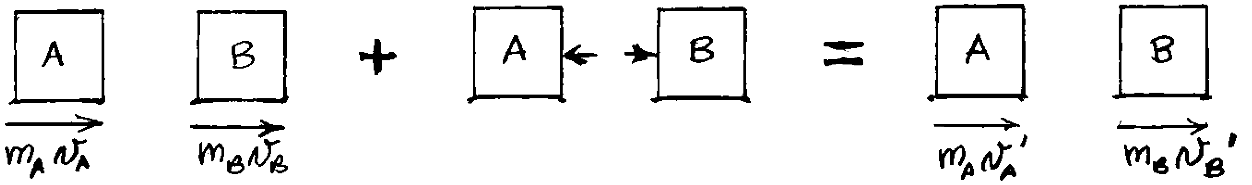
PROBLEM 13.156

Collars A and B, of the same mass m, are moving toward each other with identical speeds as shown. Knowing that the coefficient of restitution between the collars is e, determine the energy lost in the impact as a function of m, e and v.

SOLUTION

Impulse-momentum principle (collars A and B):

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



Horizontal components $\xrightarrow{+}$: $m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$

Using data, $\quad mv + m(-v) = mv_A' + mv_B'$

or $\quad v_A' + v_B' = 0 \quad (1)$

Apply coefficient of restitution.

$$v_B' - v_A' = e(v_A - v_B)$$
$$v_B' - v_A' = e[v - (-v)]$$
$$v_B' - v_A' = 2ev \quad (2)$$

Subtracting Eq. (1) from Eq. (2), $\quad -2v_A = 2ev$

$$v_A = -ev \qquad \mathbf{v}_A = ev \longleftarrow$$

Adding Eqs. (1) and (2), $\quad 2v_B = 2ev$

$$v_B = ev \qquad \mathbf{v}_B = ev \longrightarrow$$

Kinetic energies: $T_1 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 = \frac{1}{2}mv^2 + \frac{1}{2}m(-v)^2 = mv^2$

$$T_2 = \frac{1}{2}m_A(v_A')^2 + \frac{1}{2}m_B(v_B')^2 = \frac{1}{2}m(ev)^2 + \frac{1}{2}m(ev)^2 = e^2mv^2$$

Energy loss: $\quad T_1 - T_2 = (1 - e^2)\, mv^2$ ◀

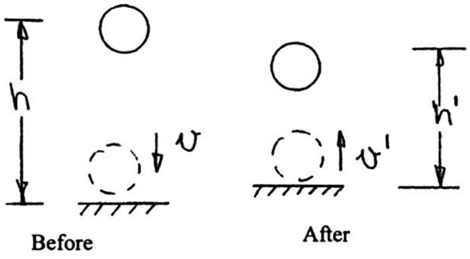
PROBLEM 13.157

One of the requirements for tennis balls to be used in official competition is that, when dropped onto a rigid surface from a height of 100 in., the height of the first bounce of the ball must be in the range 53 in. $\le h \le 58$ in. Determine the range of the coefficient of restitution of the tennis balls satisfying this requirement.

SOLUTION



Uniform accelerated motion:

$$v = \sqrt{2gh}$$

$$v' = \sqrt{2gh'}$$

Coefficient of restitution: $e = \dfrac{v'}{v}$

$$e = \sqrt{\frac{h'}{h}}$$

Height of drop $h = 100\text{ in.}$

Height of bounce $53\text{ in.} \le h' \le 58\text{ in.}$

Thus, $\sqrt{\dfrac{53}{100}} \le e \le \sqrt{\dfrac{58}{100}}$ $\qquad 0.728 \le e \le 0.762$ ◀

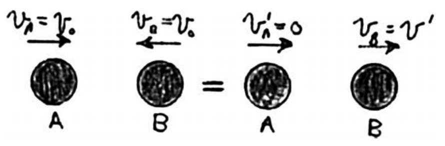
PROBLEM 13.158

Two disks sliding on a frictionless horizontal plane with opposite velocities of the same magnitude v_0 hit each other squarely. Disk A is known to have a weight of 6-lb and is observed to have zero velocity after impact. Determine (a) the weight of disk B, knowing that the coefficient of restitution between the two disks is 0.5, (b) the range of possible values of the weight of disk B if the coefficient of restitution between the two disks is unknown.

SOLUTION

Total momentum conserved:



$$\xrightarrow{+} m_A v_A + m_B v_B = m_A v'_A + m_B v'$$

$$(m_A) v_0 + m_B(-v_0) = 0 + m_B v'$$

$$v' = \left(\frac{m_A}{m_B} - 1\right) v_0 \qquad (1)$$

Relative velocities:

$$v'_B - v'_A = e(v_A - v_B)$$
$$v' = 2ev_0 \qquad (2)$$

Subtracting Eq. (2) from Eq. (1) and dividing by v_0,

$$\frac{m_A}{m_B} - 1 - 2e = 0 \qquad \frac{m_A}{m_B} = 1 + 2e \qquad m_B = \frac{m_A}{1 + 2e}$$

Since weight is proportional to mass, $W_B = \dfrac{W_A}{1 + 2e}$ (3)

(a) With $W_A = 6$ lb and $e = 0.5$,

$$W_B = \frac{6}{1 + (2)(0.5)}$$

$W_B = 3.00$ lb ◀

(b) With $W_A = 6$ lb and $e = 1$,

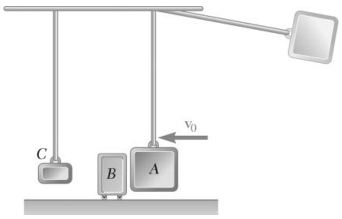
$$W_B = \frac{6}{1 + (2)(1)} = 2 \text{ lb}$$

With $W_A = 6$ lb and $e = 0$,

$$W_B = \frac{6}{1 + (2)(0)} = 6 \text{ lb}$$

Range: $2.00 \text{ lb} \le W_B \le 6.00 \text{ lb}$ ◀

If you are a student using this Manual, you are using it without permission.*



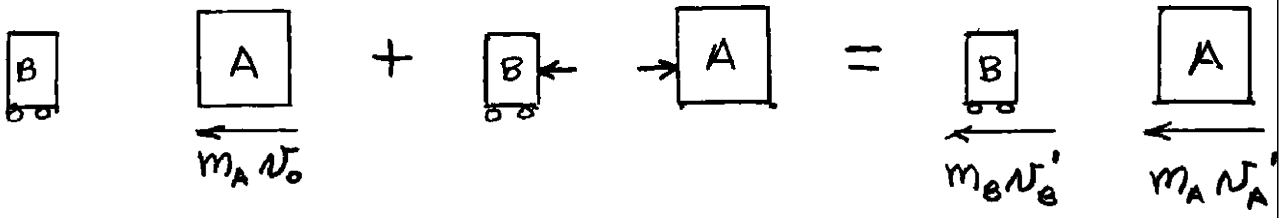
PROBLEM 13.159

To apply shock loading to an artillery shell, a 20-kg pendulum A is released from a known height and strikes impactor B at a known velocity $\mathbf{v_0}$. Impactor B then strikes the 1-kg artillery shell C. Knowing the coefficient of restitution between all objects is e, determine the mass of B to maximize the impulse applied to the artillery shell C.

SOLUTION

First impact: A impacts B. $\quad m_A = 20$ kg, $\ m_B = ?$

Impulse-momentum: $\quad \Sigma m\mathbf{v} + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$



Components directed left:

$$m_A v_0 = m_A v_A' + m_B v_B'$$

$$20 v_0 = 20 v_A' + m_B v_B' \qquad (1)$$

Coefficient of restitution:

$$v_B' - v_A' = e(v_A - v_B)$$

$$v_B' - v_A' = e v_0$$

$$v_A' = v_B' - e v_0 \qquad (2)$$

Substituting Eq. (2) into Eq. (1) yields

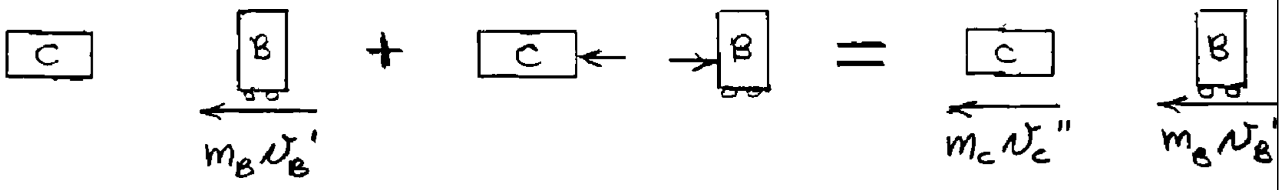
$$20 v_0 = 20(v_B' - e v_0) + m_B v_B'$$

$$20 v_0 (1+e) = (+m_B) v_B'$$

$$v_B' = \frac{20 v_0 (1+e)}{20 + m_B} \qquad (3)$$

Second impact: B impacts C. $\quad m_B = ?,\ m_C = 1$ kg

Impulse-momentum: $\quad \Sigma m\mathbf{v}_2 + \Sigma \mathbf{Imp}_{2\to 3} = \Sigma m\mathbf{v}_3$



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.159 (Continued)

Components directed left:

$$m_B v_B' = m_B v_B'' + m_C v_C''$$

$$m_B v_B' = m_B v_B'' + v_C'' \quad (4)$$

Coefficient of restitution: $\quad v_C'' - v_B'' = e(v_B' - v_C')$

$$v_C'' - v_B'' = e v_B'$$

$$v_B'' - v_C'' = e v_C' \quad (5)$$

Substituting Eq. (4) into Eq. (5) yields

$$m_B v_B' = m_B (v_C'' - e v_B') + m_C v_C''$$

$$m_B v_B' (1+e) = (1+m_B) v_C''$$

$$v_C'' = \frac{m_B v_B' (1+e)}{1+m_B} \quad (6)$$

Substituting Eq. (3) for v_B' in Eq. (6) yields

$$v_C'' = \frac{20 m_B v_0 (1+e)^2}{(20+m_B)(1+m_B)}$$

The impulse applied to the shell C is

$$m_C v_C'' = \frac{(1)(20) m_B v_0 (1+e)^2}{(20+m_B)(1+m_B)}$$

To maximize this impulse choose m_B such that

$$Z = \frac{m_B}{(20+m_B)(1+m_B)}$$

is maximum. Set dZ/dm_B equal to zero.

$$\frac{dZ}{dm_B} = \frac{(20+m_B)(1+m_B) - m_B[(20+m_B)+(1+m_B)]}{(20+m_B)^2(1+m_B)^2} = 0$$

$$20 + 21 m_B + m_B^2 - m_B(21 + 2m_B) = 0$$

$$20 - m_B^2 = 0$$

$m_B = 4.47$ kg ◀

PROBLEM 13.160

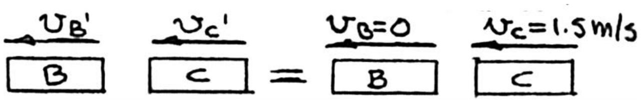
Two identical cars A and B are at rest on a loading dock with brakes released. Car C, of a slightly different style but of the same weight, has been pushed by dockworkers and hits car B with a velocity of 1.5 m/s. Knowing that the coefficient of restitution is 0.8 between B and C and 0.5 between A and B, determine the velocity of each car after all collisions have taken place.

SOLUTION

$$m_A = m_B = m_C = m$$

Collision between B and C:

The total momentum is conserved:



$$\xleftarrow{+} \quad mv_B' + mv_C' = mv_B + mv_C$$

$$v_B' + v_C' = 0 + 1.5 \qquad (1)$$

Relative velocities:

$$(v_B - v_C)(e_{BC}) = (v_C' - v_B')$$
$$(-1.5)(0.8) = (v_C' - v_B')$$
$$-1.2 = v_C' - v_B' \qquad (2)$$

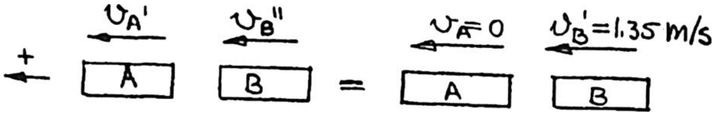
Solving (1) and (2) simultaneously,

$$v_B' = 1.35 \text{ m/s}$$
$$v_C' = 0.150 \text{ m/s}$$

$\mathbf{v}_C' = 0.150$ m/s $\longleftarrow$ ◀

Since $v_B' > v_C'$, car B collides with car A.

Collision between A and B:



$$mv_A' + mv_B'' = mv_A + mv_B'$$
$$v_A' + v_B'' = 0 + 1.35 \qquad (3)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Relative velocities:

$$(v_A - v_B')e_{AB} = (v_B'' - v_A')$$
$$(0 - 1.35)(0.5) = v_B'' - v_A'$$
$$v_A' - v_B'' = 0.675 \qquad (4)$$

Solving (3) and (4) simultaneously,

$$2v_A' = 1.35 + 0.675$$

$$\mathbf{v}_A' = 1.013 \text{ m/s} \longleftarrow \blacktriangleleft$$

$$\mathbf{v}_B'' = 0.338 \text{ m/s} \longleftarrow \blacktriangleleft$$

Since $v_C' < v_B'' < v_A'$, there are no further collisions.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.161

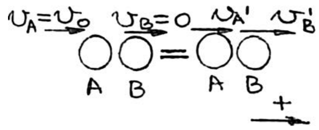
Three steel spheres of equal weight are suspended from the ceiling by cords of equal length which are spaced at a distance slightly greater than the diameter of the spheres. After being pulled back and released, sphere *A* hits sphere *B*, which then hits sphere *C*. Denoting by *e* the coefficient of restitution between the spheres and by $\mathbf{v}_0$ the velocity of *A* just before it hits *B*, determine (*a*) the velocities of *A* and *B* immediately after the first collision, (*b*) the velocities of *B* and *C* immediately after the second collision. (*c*) Assuming now that *n* spheres are suspended from the ceiling and that the first sphere is pulled back and released as described above, determine the velocity of the last sphere after it is hit for the first time. (*d*) Use the result of Part *c* to obtain the velocity of the last sphere when $n = 5$ and $e = 0.9$.

SOLUTION



(*a*) First collision (between *A* and *B*):

The total momentum is conserved:

$$mv_A + mv_B = mv_A' + mv_B'$$

$$v_0 = v_A' + v_B' \quad (1)$$

Relative velocities:

$$(v_A - v_B)e = (v_B' - v_A')$$

$$v_0 e = v_B' - v_A' \quad (2)$$

Solving Equations (1) and (2) simultaneously,

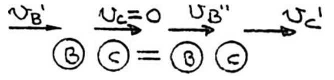
$$v_A' = \frac{v_0(1-e)}{2} \blacktriangleleft$$

$$v_B' = \frac{v_0(1+e)}{2} \blacktriangleleft$$

(*b*) Second collision (between *B* and *C*):

The total momentum is conserved.

$$mv_B' + mv_C = mv_B'' + mv_C'$$



Using the result from (*a*) for v_B'

$$\frac{v_0(1+e)}{2} + 0 = v_B'' + v_C' \quad (3)$$

Relative velocities:

$$(v_B' - 0)e = v_C' - v_B''$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.161 (Continued)

Substituting again for v'_B from (*a*)

$$v_0 \frac{(1+e)}{2}(e) = v'_C - v''_B \qquad (4)$$

Solving equations (3) and (4) simultaneously,

$$v'_C = \frac{1}{2}\left[\frac{v_0(1+e)}{2} + v_0(1+e)\frac{(e)}{2}\right]$$

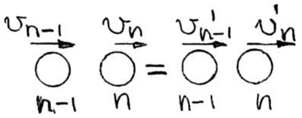
$$v'_C = \frac{v_0(1+e)^2}{4} \blacktriangleleft$$

$$v''_B = \frac{v_0(1-e^2)}{4} \blacktriangleleft$$

(*c*) For *n* spheres

n balls

$(n-1)$th collision,



we note from the answer to part (*b*) with $n = 3$

$$v'_n = v'_3 = v'_C = \frac{v_0(1+e)^2}{4}$$

or $$v'_3 = \frac{v_0(1+e)^{(3-1)}}{2^{(3-1)}}$$

Thus, for *n* balls

$$v'_n = \frac{v_0(1+e)^{(n-1)}}{2^{(n-1)}} \blacktriangleleft$$

(*d*) For $n = 5,\ e = 0.90,$

from the answer to part (*c*) with $n = 5$

$$v'_B = \frac{v_0(1+0.9)^{(5-1)}}{2^{(5-1)}}$$

$$= \frac{v_0(1.9)^4}{(2)^4}$$

$$v'_B = 0.815 v_0 \blacktriangleleft$$

PROBLEM 13.162

At an amusement park there are 200-kg bumper cars *A*, *B*, and *C* that have riders with masses of 40 kg, 60 kg, and 35 kg respectively. Car *A* is moving to the right with a velocity $\mathbf{v}_A = 2$ m/s and car *C* has a velocity $\mathbf{v}_B = 1.5$ m/s to the left, but car *B* is initially at rest. The coefficient of restitution between each car is 0.8. Determine the final velocity of each car, after all impacts, assuming (*a*) cars *A* and *C* hit car *B* at the same time, (*b*) car *A* hits car *B* before car *C* does.

SOLUTION

Assume that each car with its rider may be treated as a particle. The masses are:

$$m_A = 200 + 40 = 240 \text{ kg},$$
$$m_B = 200 + 60 = 260 \text{ kg},$$
$$m_C = 200 + 35 = 235 \text{ kg}.$$

Assume velocities are positive to the right. The initial velocities are:

$$v_A = 2 \text{ m/s} \quad v_B = 0 \quad v_C = -1.5 \text{ m/s}$$

Let v'_A, v'_B, and v'_C be the final velocities.

(*a*) Cars *A* and *C* hit *B* at the same time. Conservation of momentum for all three cars.

$$m_A v_A + m_B v_B + m_C v_C = m_A v'_A + m_B v'_B + m_C v'_C$$
$$(240)(2) + 0 + (235)(-1.5) = 240v'_A + 260v'_B + 235v'_C \quad (1)$$

Coefficient of restition for cars *A* and *B*.

$$v'_B - v'_A = e(v_A - v_B) = (0.8)(2 - 0) = 1.6 \quad (2)$$

Coefficient of restitution for cars *B* and *C*.

$$v'_C - v'_B = e(v_B - v_C) = (0.8)[0 - (-1.5)] = 1.2 \quad (3)$$

Solving Eqs. (1), (2), and (3) simultaneously,

$$v'_A = -1.288 \text{ m/s} \quad v'_B = 0.312 \text{ m/s} \quad v'_C = 1.512 \text{ m/s}$$

$\mathbf{v}'_A = 1.288 \text{ m/s} \longleftarrow$ ◀

$\mathbf{v}'_B = 0.312 \text{ m/s} \longrightarrow$ ◀

$\mathbf{v}'_C = 1.512 \text{ m/s} \longrightarrow$ ◀

If you are a student using this Manual, you are using it without permission.*

(*b*) Car *A* hits car *B* before *C* does.

First impact. Car *A* hits car *B*. Let v'_A and v'_B be the velocities after this impact. Conservation of momentum for cars *A* and *B*.

$$m_A v_A + m_B v_B = m_A v'_A + m_B v'_B$$

$$(240)(2) + 0 = 240 v'_A + 260 v'_B \qquad (4)$$

Coefficient of restitution for cars *A* and *B*.

$$v'_B - v'_A = e(v_A - v_B) = (0.8)(2 - 0) = 1.6 \qquad (5)$$

Solving Eqs. (4) and (5) simultaneously,

$$v'_A = 0.128 \text{ m/s}, \quad v'_B = 1.728 \text{ m/s}$$

$$\mathbf{v}'_A = 0.128 \text{ m/s} \longrightarrow$$

$$\mathbf{v}'_B = 1.728 \text{ m/s} \longrightarrow$$

Second impact. Cars *B* and *C* hit. Let v''_B and v''_C be the velocities after this impact. Conservation of momentum for cars *B* and *C*.

$$m_B v'_B + m_C v_C = m_B v''_B + m_C v''_C$$

$$(260)(1.728) + (235)(-1.5) = 260 v''_B + 235 v''_C \qquad (6)$$

Coefficient of restitution for cars *B* and *C*.

$$v''_C - v''_B = e(v'_B - v_C) = (0.8)[1.728 - (-1.5)] = 2.5824 \qquad (7)$$

Solving Eqs. (6) and (7) simultaneously,

$$v''_B = -1.03047 \text{ m/s} \quad v''_C = 1.55193 \text{ m/s}$$

$$\mathbf{v}''_B = 1.03047 \text{ m/s} \longleftarrow$$

$$\mathbf{v}''_C = 1.55193 \text{ m/s} \longrightarrow$$

Third impact. Cars *A* and *B* hit again. Let v'''_A and v'''_B be the velocities after this impact. Conservation of momentum for cars *A* and *B*.

$$m_A v'_A + m_B v''_B = m_A v'''_A + m_B v'''_B$$

$$(240)(0.128) + (260)(-1.03047) = 240 v'''_A + 260 v'''_B \qquad (8)$$

Coefficient of restitution for cars *A* and *B*.

$$v'''_B - v'''_A = e(v'_A - v''_B) = (0.8)[0.128 - (-1.03047)] = 0.926776 \qquad (9)$$

Solving Eqs. (8) and (9) simultaneously,

$$v'''_A = -0.95633 \text{ m/s}$$

$$v'''_B = -0.02955 \text{ m/s}$$

$$\mathbf{v}'''_A = 0.95633 \text{ m/s} \longleftarrow$$

$$\mathbf{v}'''_B = 0.02955 \text{ m/s} \longleftarrow$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.163

At an amusement park there are 200-kg bumper cars *A*, *B*, and *C* that have riders with masses of 40 kg, 60 kg, and 35 kg respectively. Car *A* is moving to the right with a velocity $\mathbf{v}_A = 2$ m/s when it hits stationary car *B*. The coefficient of restitution between each car is 0.8. Determine the velocity of car *C* so that after car *B* collides with car *C* the velocity of car *B* is zero.

SOLUTION

Assume that each car with its rider may be treated as a particle. The masses are:

$$m_A = 200 + 40 = 240 \text{ kg}$$
$$m_B = 200 + 60 = 260 \text{ kg}$$
$$m_C = 200 + 35 = 235 \text{ kg}$$

Assume velocities are positive to the right. The initial velocities are:

$$v_A = 2 \text{ m/s}, \quad v_B = 0, \quad v_C = ?$$

First impact. Car *A* hits car *B*. Let v_A' and v_B' be the velocities after this impact. Conservation of momentum for cars *A* and *B*.

$$m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$$
$$(240)(2) + 0 = 240 v_A' + 260 v_B' \qquad (1)$$

Coefficient of restitution for cars *A* and *B*.

$$v_B' - v_A' = e(v_A - v_B) = (0.8)(2 - 0) = 1.6 \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$v_A' = 0.128 \text{ m/s}$$
$$v_B' = 1.728 \text{ m/s}$$
$$\mathbf{v}_A' = 0.128 \text{ m/s} \longrightarrow$$
$$\mathbf{v}_B' = 1.728 \text{ m/s} \longrightarrow$$

Second impact. Cars *B* and *C* hit. Let v_B'' and v_C'' be the velocities after this impact. $v_B'' = 0.$ Coefficient of restitution for cars *B* and *C*.

$$v_C'' - v_B'' = e(v_B' - v_C) = (0.8)(1.728 - v_C)$$
$$v_C'' = 1.3824 - 0.8 v_C$$

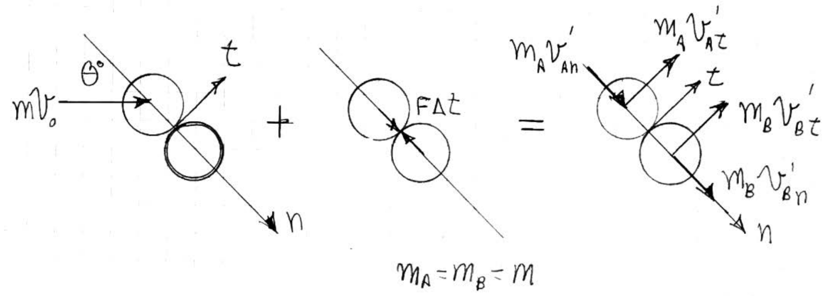
PROBLEM 13.164

Two identical billiard balls can move freely on a horizontal table. Ball A has a velocity $\mathbf{v}_0$ as shown and hits ball B, which is at rest, at a Point C defined by $\theta = 45°$. Knowing that the coefficient of restitution between the two balls is $e = 0.8$ and assuming no friction, determine the velocity of each ball after impact.

SOLUTION



Ball A: *t-dir*

$$\cancel{m}v_0 \sin\theta = \cancel{m}v'_{At} \Rightarrow v'_{At} = v_0 \sin\theta$$

Ball B: *t-dir*

$$0 = m_B v'_{Bt} \Rightarrow v'_{Bt} = 0$$

Balls $A + B$: *n-dir*

$$\cancel{m}v_0 \cos\theta + 0 = \cancel{m}\, v'_{An} + \cancel{m}\, v'_{Bn} \quad (1)$$

Coefficient of restitution

$$v'_{Bn} - v'_{An} = e(v_{An} - v_{Bn})$$

$$v'_{Bn} - v'_{An} = e(v_0 \cos\theta - 0) \quad (2)$$

Solve (1) and (2)

$$v'_{An} = v_0\left(\frac{1-e}{2}\cos\theta\right); \quad v'_{Bn} = v_0\left(\frac{1+e}{2}\right)\cos\theta$$

With numbers

$$e = 0.8; \quad \theta = 45°$$

$$v'_{At} = v_0 \sin 45° = 0.707\, v_0$$

$$v'_{An} = v_0\left(\frac{1-0.8}{2}\cos 45°\right) = 0.0707\ v_0$$

$$v'_{Bt} = 0$$

$$v'_{Bn} = v_0\left(\frac{1+0.8}{2}\right)\cos 45° = 0.6364\, v_0$$

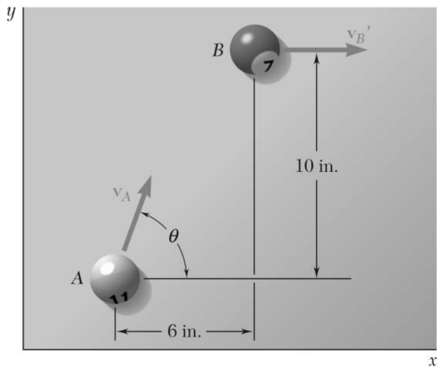
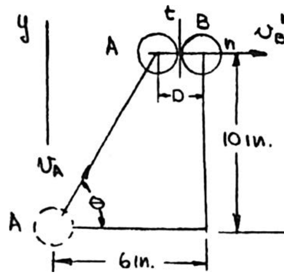
PROBLEM 13.165



The coefficient of restitution is 0.9 between the two 2.37-in. diameter billiard balls A and B. Ball A is moving in the direction shown with a velocity of 3 ft/s when it strikes ball B, which is at rest. Knowing that after impact B is moving in the x direction, determine (*a*) the angle θ, (*b*) the velocity of B after impact.

SOLUTION

(*a*) Since v_B' is in the x-direction and (assuming no friction), the common tangent between A and B at impact must be parallel to the y-axis,



$$\tan\theta = \frac{10}{6-D}$$

$$\theta = \tan^{-1}\frac{10}{6-2.37}$$

$$= 70.04°$$

$\theta = 70.0°$ ◀

(*b*) Conservation of momentum in $x(n)$ direction:

$$mv_A\cos\theta + m(v_B)_n = m(v_A')_n + mv_B'$$

$$(3)(\cos 70.04) + 0 = (v_A')_n + v_B'$$

$$1.0241 = (v_A')_n + (v_B') \qquad (1)$$

Relative velocities in the n direction:

$e = 0.9$ $\qquad (v_A\cos\theta - (v_B)_n)e = v_B' - (v_A')_n$

$$(1.0241 - 0)(0.9) = v_B' - (v_A')_n \qquad (2)$$

$(1) + (2)$ $\qquad 2v_B' = 1.0241(1.9)$ $\qquad \mathbf{v}_B' = 0.972$ ft/s ⟶ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.166

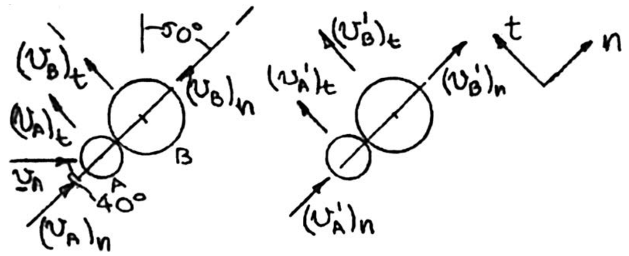
A 600-g ball *A* is moving with a velocity of magnitude 6 m/s when it is hit as shown by a 1-kg ball *B* which has a velocity of magnitude 4 m/s. Knowing that the coefficient of restitution is 0.8 and assuming no friction, determine the velocity of each ball after impact.

SOLUTION



Before After

$$v_A = 6 \text{ m/s}$$
$$(v_A)_n = (6)(\cos 40°) = 4.596 \text{ m/s}$$
$$(v_A)_t = -6(\sin 40°) = -3.857 \text{ m/s}$$
$$v_B = (v_B)_n = -4 \text{ m/s}$$
$$(v_B)_t = 0$$

t-direction:

Total momentum conserved:

$$m_A(v_A)_t + m_B(v_B)_t = m_A(v'_B)_t + m_B(v'_B)_t$$
$$(0.6 \text{ kg})(-3.857 \text{ m/s}) + 0 = (0.6 \text{ kg})(v'_A)_t + (1 \text{ kg})(v'_B)t$$
$$-2.314 \text{ m/s} = 0.6\ (v'_A)_t + (v'_B)_t \qquad (1)$$

Ball *A* alone:

Momentum conserved:

$$m_A(v_A)_t = m_A(v'_A)_t \qquad -3.857 = (v'_A)_t$$
$$(v'_A)_t = -3.857 \text{ m/s} \qquad (2)$$

Replacing $(v'_A)_t$ in (2) in Eq. (1)

$$-2.314 = (0.6)(-3.857) + (v'_B)_t$$
$$-2.314 = -2.314 + (v'_B)_t$$
$$(v'_B)_t = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

n-direction:

Relative velocities:

$$[(v_A)_n - (v_B)_n]e = (v'_B)_n - (v'_A)_n$$
$$[(4.596) - (-4)](0.8) = (v'_B)_n - (v'_A)_n$$
$$6.877 = (v'_B)_n - (v'_A)_n \qquad (3)$$

Total momentum conserved:

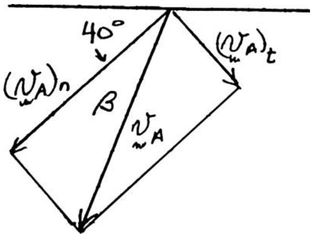
$$m_A(v_A)_n + m_B(v_B)_n = m_A(v'_A)_n + m_B(v'_B)_n$$
$$(0.6\text{ kg})(4.596\text{ m/s}) + (1\text{ kg})(-4\text{ m/s}) = (1\text{ kg})(v'_B)_n + (0.6\text{ kg})(v'_A)_n$$
$$-1.2424 = (v'_B)_n + 0.6(v'_A)_n \qquad (4)$$

Solving Eqs. (4) and (3) simultaneously,

$$(v'_A)_n = 5.075\text{ m/s}$$
$$(v'_B)_n = 1.802\text{ m/s}$$

Velocity of A:

$$\tan\beta = \frac{|(v_A)_t|}{|(v_A)_n|} = \frac{3.857}{5.075}$$
$$\beta = 37.2^\circ \qquad \beta + 40^\circ = 77.2^\circ$$
$$v'_A = \sqrt{(3.857)^2 + (5.075)^2} = 6.37\text{ m/s}$$



$\mathbf{v}'_A = 6.37$ m/s ⦣ 77.2° ◀

Velocity of B: $\mathbf{v}'_B = 1.802$ m/s ⦣ 40° ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.167

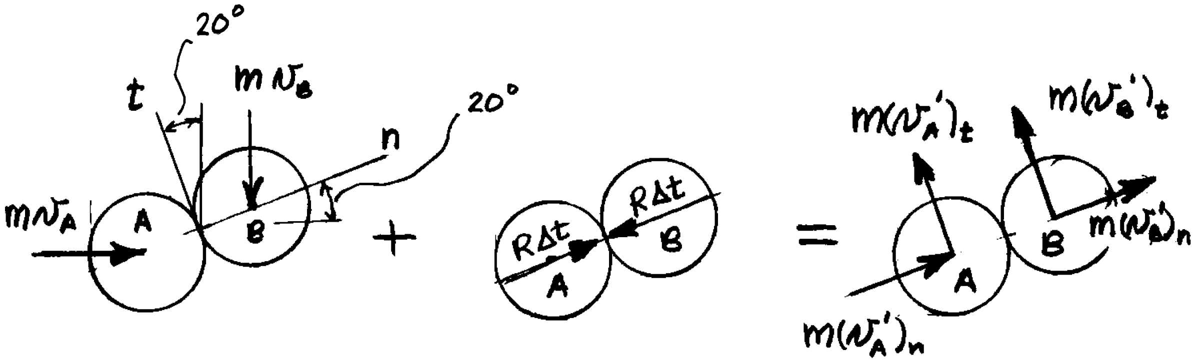
Two identical hockey pucks are moving on a hockey rink at the same speed of 3 m/s and in perpendicular directions when they strike each other as shown. Assuming a coefficient of restitution $e = 0.9$, determine the magnitude and direction of the velocity of each puck after impact.

SOLUTION

Use principle of impulse-momentum: $\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$



t-direction for puck *A*:

$$-mv_A \sin 20° + 0 = m(v'_A)_t$$

$$(v'_A)_t = v_A \sin 20° = 3\sin 20° = 1.0261 \text{ m/s}$$

t-direction for puck *B*:

$$-mv_B \cos 20° + 0 = m(v'_B)_t$$

$$(v'_B)_t = v_B \cos 20° = -3\cos 20° = -2.8191 \text{ m/s}$$

n-direction for both pucks:

$$mv_A \cos 20° - mv_B \sin 20° = m(v'_A)_n + m(v'_B)_n$$

$$(v'_A)_n + (v'_B)_n = v_A \cos 20° - v_B \sin 20°$$

$$= 3\cos 20° - 3\sin 20° \qquad (1)$$

Coefficient of restitution: $e = 0.9$

$$(v'_B)_n - (v'_A)_n = e[(v_A)_n - (v_B)_n]$$

$$= 0.9[3\cos 20° - (-3)\sin 20°] \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$(v'_A)_n = -0.8338 \text{ m/s} \qquad (v'_B)_n = 2.6268 \text{ m/s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.168

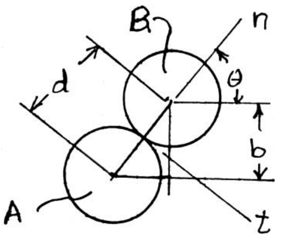
Two identical pool balls of 57.15-mm diameter, may move freely on a pool table. Ball B is at rest and ball A has an initial velocity $\mathbf{v} = v_0\mathbf{i}$. ($a$) Knowing that $b = 50$ mm and $e = 0.7$, determine the velocity of each ball after impact. (b) Show that if $e = 1$, the final velocities of the balls from a right angle for all values of b.

SOLUTION

Geometry at instant of impact:

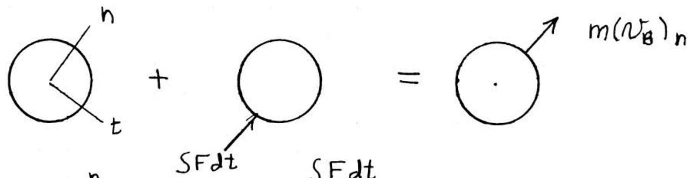


$$\sin\theta = \frac{b}{d} = \frac{50}{57.15}$$
$$\theta = 61.032°$$

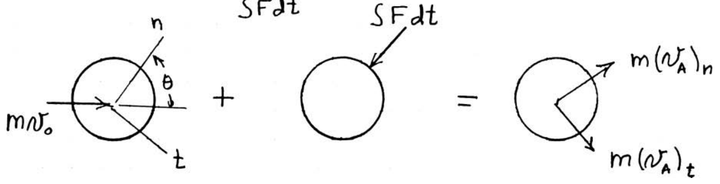
Directions n and t are shown in the figure.

Principle of impulse and momentum:

Ball B:



Ball A:



Ball A, t-direction: $\quad mv_0 \sin\theta + 0 = m(v_A)_t \quad (v_A)_t = v_0 \sin\theta \qquad (1)$

Ball B, t-direction: $\quad 0 + 0 = m(v_B)_t \quad (v_B)_t = 0 \qquad (2)$

Balls A and B, n-direction: $\quad mv_0 \cos\theta + 0 + m(v_A)_n + m(v_B)_n$

$$(v_A)_n + (v_B)_n = v_0 \cos\theta \qquad (3)$$

Coefficient of restitution: $\quad (v_B)_n - (v_A)_n = e[v_0 \cos\theta] \qquad (4)$

(a) $\quad e = 0.7.$ From Eqs. (1) and (2),

$$(v_A)_t = 0.87489 v_0 \qquad (1)'$$

$$(v_B)_t = 0 \qquad (2)'$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

From Eqs. (3) and (4),

$$(v_A)_n + (v_B)_n = 0.48432v_0 \qquad (3)'$$

$$(v_B)_n - (v_A)_n = (0.7)(0.48432v_0) \qquad (4)'$$

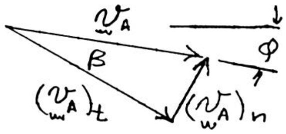
Solving Eqs. (5) and (6) simultaneously,

$$(v_A)_n = 0.072648v_0 \qquad (v_B)_n = 0.41167v_0$$

$$v_A = \sqrt{(v_A)_n^2 + (v_A)_t^2}$$

$$= \sqrt{(0.072648v_0)^2 + (0.87489v_0^2}$$

$$= 0.87790v_0$$



$$\tan\beta = \frac{(v_A)_n}{(v_A)_t} = \frac{0.072648v_0}{0.87489v_0} = 0.083037$$

$$\beta = 4.7468°$$

$$\varphi = 90° - \theta - \beta$$

$$= 90° - 61.032° - 4.7468°$$

$$= 24.221°$$

$\mathbf{v}_A = 0.878v_0 \searrow 24.2°$ ◀

$\mathbf{v}_B = 0.412v_0 \measuredangle 61.0°$ ◀

(*b*) $e = 1$. Eqs. (3) and (4) become

$$(v_A)_n + (v_B)_n = v_0 \cos\theta \qquad (3)''$$

$$(v_B)_n - (v_A)_n = v_0 \cos\theta \qquad (4)''$$

Solving Eqs. (3)″ and (4)″ simultaneously,

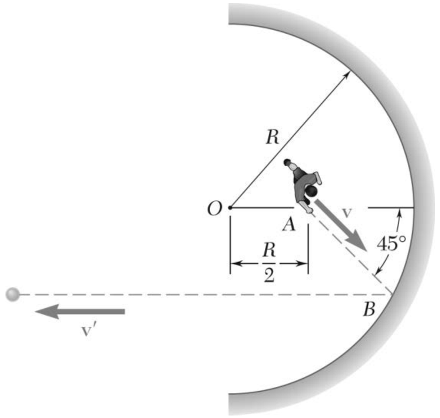
$$(v_A)_n = 0, \quad (v_B)_t = v_0 \cos\theta$$

But $\qquad (v_A)_t = v_0 \sin\theta, \quad \text{and} \quad (v_B)_t = 0$

$\mathbf{v}_A$ is in the *t*-direction and $\mathbf{v}_B$ is in the *n*-direction; therefore, the velocity vectors form a right angle.

If you are a student using this Manual, you are using it without permission.*

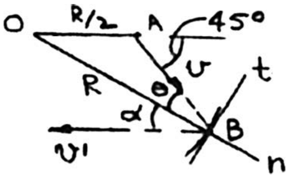
PROBLEM 13.169



A boy located at Point A halfway between the center O of a semicircular wall and the wall itself throws a ball at the wall in a direction forming an angle of 45° with OA. Knowing that after hitting the wall the ball rebounds in a direction parallel to OA, determine the coefficient of restitution between the ball and the wall.

SOLUTION

Law of sines:



$$\frac{\sin\theta}{\frac{R}{2}} = \frac{\sin 135°}{R}$$

$$\theta = 20.705°$$

$$\alpha = 45° - 20.705°$$

$$= 24.295°$$

Conservation of momentum for ball in t-direction:

$$-v\sin\theta = -v'\sin\alpha$$

Coefficient of restitution in n: $\quad v(\cos\theta)e = v'\cos\alpha$

Dividing, $\quad \dfrac{\tan\theta}{e} = \tan\alpha$

$$e = \frac{\tan 20.705°}{\tan 24.295°}$$

$e = 0.837$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.170

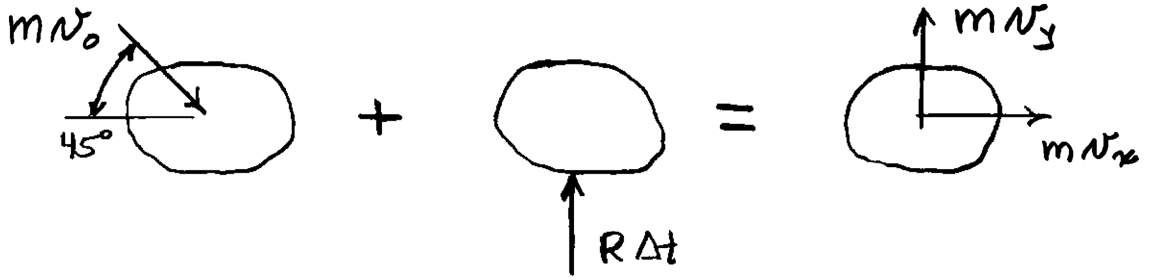
The Mars Pathfinder spacecraft used large airbags to cushion its impact with the planet's surface when landing. Assuming the spacecraft had an impact velocity of 18 m/s at an angle of 45° with respect to the horizontal, the coefficient of restitution is 0.85 and neglecting friction, determine (*a*) the height of the first bounce, (*b*) the length of the first bounce. (Acceleration of gravity on the Mars = 3.73 m/s^2.)

SOLUTION

Use impulse-momentum principle.

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



The horizontal direction (x to the right) is the tangential direction and the vertical direction (y upward) is the normal direction.

Horizontal components: $\quad mv_0 \sin 45° = 0 = mv_x$

$$v_x = v_0 \sin 45°. \qquad \mathbf{v}_x = 12.728 \text{ m/s} \longrightarrow$$

Vertical components, using coefficient of restitution $e = 0.85$

$$v_y - 0 = e[0 - (-v_0 \cos 45°)]$$

$$v_y = (0.85)(18 \cos 45°) \qquad \mathbf{v}_y = 10.819 \text{ m/s} \uparrow$$

The motion during the first bounce is projectile motion.

Vertical motion: $\quad y = (v_y)_0 t - \frac{1}{2} g t^2$

$$v_y = (v_y)_0 - gt$$

Horizontal motion: $\quad x = v_x t$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.171

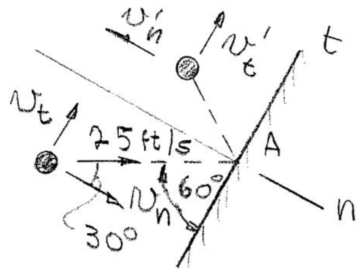
A girl throws a ball at an inclined wall from a height of 3 ft, hitting the wall at A with a horizontal velocity $\mathbf{v}_0$ of magnitude 25 ft/s. Knowing that the coefficient of restitution between the ball and the wall is 0.9 and neglecting friction, determine the distance d from the foot of the wall to the Point B where the ball will hit the ground after bouncing off the wall.

SOLUTION



Momentum in t direction is conserved

$$mv\sin 30° = mv'_t$$

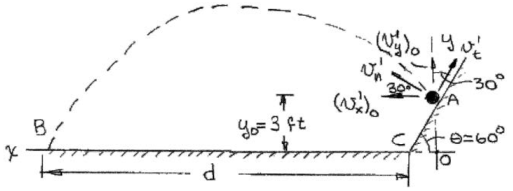
$$(25)(\sin 30°) = v'_t$$

$$v'_t = 12.5 \text{ ft/s}$$

Coefficient of restitution in n-direction

$$(v\cos 30°)e = v'_n$$

$$(25)(\cos 30°)(0.9) = v'_n \qquad v'_n = 19.49 \text{ ft/s}$$



Write v' in terms of x and y components

$$(v'_x)_0 = v'_n(\cos 30°) - v'_t(\sin 30°) = 19.49(\cos 30°) - 12.5(\sin 30°)$$
$$= 10.63 \text{ ft/s}$$

$$(v'_y)_0 = v'_n(\sin 30°) + v'_t(\cos 30°) = 19.49(\sin 30°) + 12.5(\cos 30°)$$
$$= 20.57 \text{ ft/s}$$

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Projectile motion

$$y = y_0 + (v'_y)_0 t - \frac{1}{2}gt^2 = 3\text{ ft} + (20.57\text{ ft/s})t - (32.2\text{ ft/s}^2)\frac{t^2}{2}$$

At B,

$$y = 0 = 3 + 20.57t_B - 16.1t_B^2; \qquad t_B = 1.4098\text{ s}$$

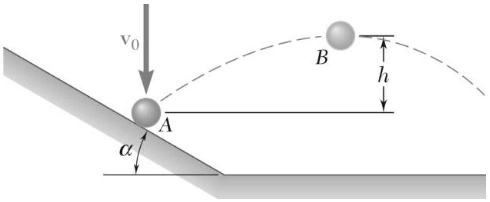
$$x_B = x_0 + (v'_x)_0 t_B = 0 + 10.63(1.4098); \qquad x_B = 14.986\text{ ft}$$

$$d = x_B - 3\cot 60° = (14.986\text{ ft}) - (3\text{ ft})\cot 60° = 13.254\text{ ft}$$

$d = 13.25$ ft ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.172

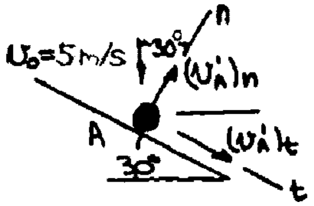


A sphere rebounds as shown after striking an inclined plane with a vertical velocity $\mathbf{v}_0$ of magnitude $v_0 = 5$ m/s. Knowing that $\alpha = 30°$ and $e = 0.8$ between the sphere and the plane, determine the height h reached by the sphere.

SOLUTION

Rebound at A

Conservation of momentum in the t-direction:



$$mv_0 \sin 30° = m(v'_A)_t$$

$$(v'_A)_t = (5 \text{ m/s})(\sin 30°) = 2.5 \text{ m/s}$$

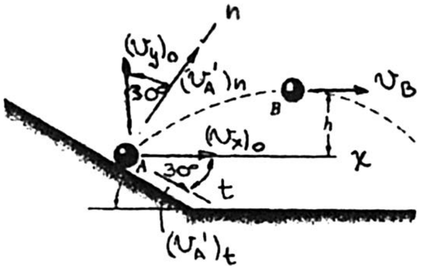
Relative velocities in the n-direction:

$$(-v_0 \cos 30° - 0)e = 0 - (v'_A)_n$$

$$(v'_A)_n = (0.8)(5 \text{ m/s})(\cos 30°) = 3.4641 \text{ m/s}$$

Projectile motion between A and B:

After rebound



$$(v_x)_0 = (v'_A)_t \cos 30° + (v'_A)_n \sin 30°$$

$$(v_x)_0 = (2.5)(\cos 30°) + (3.4641)\sin 30 = 3.8971 \text{ m/s}$$

$$(v_y)_0 = -(v'_A)_t \sin 30° + (v'_A)_n \cos 30°$$

$$(v_y)_0 = -(2.5)(\sin 30°) + (3.4641)\cos 30° = 1.750 \text{ m/s}$$

x-direction:

$$x = (v_x)_0 t \qquad v_x = (v_x)_0$$

$$x = 3.8971t \qquad v_x = 3.8971 \text{ m/s} = v_B$$

y-direction:

$$y = (v_y)_0 t - \frac{1}{2}gt^2$$

$$v_y = (v_y)_0 - gt$$

At A:

$$v_y = 0 = (v_y)_0 - gt_{AB}$$

$$t_{AB} = (v_y)_0/g = \frac{1.75 \text{ m/s}}{9.81 \text{ m/s}^2}$$

$$t_{A-B} = 0.17839 \text{ s}$$

At B:

$$y = h = (v_y)_0 t_{A-B} - \frac{gt_{A-B}^2}{2}$$

$$h = (1.75)(0.17839) - \frac{9.81}{2}(0.17839)^2$$

$h = 0.156$ m ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.173

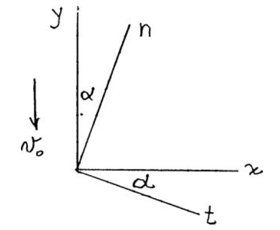
A sphere rebounds as shown after striking an inclined plane with a vertical velocity $\mathbf{v}_0$ of magnitude $v_0 = 6$ m/s. Determine the value of α that will maximize the horizontal distance the ball travels before reaching its maximum height h assuming the coefficient of restitution between the ball and the ground is (*a*) $e = 1$, (*b*) $e = 0.8$.

SOLUTION



Directions x, y, n, and t are shown in the sketch.

Analysis of the impact: Use the principle of impulse and momentum for components in the t-direction.

$$mv_0 \sin\alpha + 0 = m(v_t')_1$$

$$(v_t)_1 = v_0 \sin\alpha \qquad (1)$$

Coefficient of restitution: $(\mathbf{v}_n)_1 = -e(\mathbf{v}_n)_0$

$$(v_n)_1 = ev_0 \cos\alpha \qquad (2)$$

x and y components of velocity immediately after impact:

$$(v_x)_1 = (v_n)_1 \sin\alpha + (v_t)_1 \cos\alpha = v_0(1+e)\sin\alpha\cos\alpha$$

$$= \frac{1}{2}v_0(1+e)\sin 2\alpha \qquad (3)$$

$$(v_y)_1 = (v_n)_1 \cos\alpha - (v_t)_1 \sin\alpha = v_0(e\cos^2\alpha - \sin^2\alpha)$$

$$= \frac{1}{2}v_0[e(1+\cos 2\alpha) - (1-\cos 2\alpha)]$$

$$= \frac{1}{2}v_0[(1+e)\cos 2\alpha - (1-e)] \qquad (4)$$

Projectile motion: Use coordinates x and y with the origin at the point of impact.

$$x_0 = 0$$

$$y_0 = 0$$

Vertical motion: $v_y = (v_y)_1 - gt$

$$v_y = \frac{1}{2}v_0[(1+e)\cos 2\alpha - (1-e)] - gt$$

$v_y = 0$ at the position of maximum height where

$$t_2 = \frac{(v_y)_1}{g} = \frac{v_0}{2g}[(1+e)\cos\alpha - (1-e)] \qquad (5)$$

PROBLEM 13.173 (Continued)

Horizontal motion:
$$v_x = (v_x)_1 = \frac{1}{2} v_0 (1+e)\sin 2\alpha$$
$$x = (v_x)_1\, t$$

At the point of maximum height,

$$x_2 = (v_x)_1\, t_2 = \frac{v_0^2}{4g}(1+e)\sin 2\alpha[(1+e)\cos 2\alpha - (1-e)]$$

Let $\theta = 2\alpha$ and $Z = 4gx_2/v_0^2(1+e)$. To determine the value of θ that maximizes x_2 (or Z), differentiate Z with respect to θ and set the derivative equal to zero.

$$Z = \sin\theta[(1+e)\cos\theta - (1-e)]$$
$$\frac{dZ}{d\theta} = \cos\theta[(1+e)\cos\theta - (1-e)] - (1+e)\sin^2\theta$$
$$= (1+e)\cos^2\theta - (1-e)\cos\theta - (1+e)(1-\cos^2\theta) = 0$$
$$2(1+e)\cos^2\theta - (1-e)\cos\theta - (1+e) = 0$$

This is a quadratic equation for $\cos\theta$.

(*a*) $e = 1$
$$4\cos^2\theta - 2 = 0$$
$$\cos^2\theta = \frac{1}{2}$$
$$\cos\theta = \pm\frac{\sqrt{2}}{2}$$
$$\theta = \pm 45^\circ \quad \text{and} \quad \pm 135^\circ$$
$$\alpha = 22.5^\circ \quad \text{and} \quad 67.5^\circ$$

Reject the negative values of θ which make x_2 negative.

Reject $\alpha = 67.5^\circ$ since it makes a smaller maximum height.

$\alpha = 22.5^\circ$ ◀

(*b*) $e = 0.8$
$$3.6\cos^2\theta - 0.2\cos\theta - 1.8 = 0$$
$$\cos\theta = 0.73543 \quad \text{and} \quad -0.67987$$
$$\theta = \pm 42.656^\circ \quad \text{and} \quad \pm 132.833^\circ$$
$$\alpha = \pm 21.328^\circ \quad \text{and} \quad \pm 66.417^\circ$$

$\alpha = 21.3^\circ$ ◀

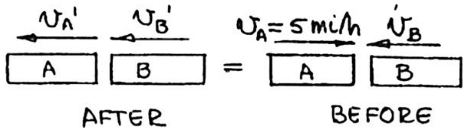
PROBLEM 13.174

Two cars of the same mass run head-on into each other at C. After the collision, the cars skid with their brakes locked and come to a stop in the positions shown in the lower part of the figure. Knowing that the speed of car A just before impact was 5 mi/h and that the coefficient of kinetic friction between the pavement and the tires of both cars is 0.30, determine (*a*) the speed of car B just before impact, (*b*) the effective coefficient of restitution between the two cars.

SOLUTION

(*a*) At C:



Conservation of total momentum:

$$m_A = m_B = m$$

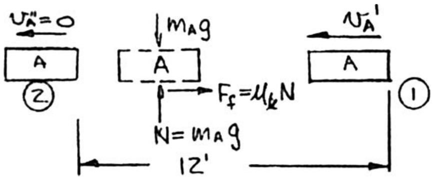
$$5 \text{ mi/h} = 7.333 \text{ ft/s}$$

$$\overset{+}{\longleftarrow} \quad m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$$

$$-7.333 + v_B = v_A' + v_B' \qquad (1)$$

Work and energy.

Care A (after impact):



$$T_1 = \frac{1}{2} m_A (v_A')^2$$

$$T_2 = 0$$

$$U_{1-2} = F_f (12)$$

$$U_{1-2} = \mu_k m_A g (12 \text{ ft})$$

$$T_1 + U_{1-2} = T_2$$

$$\frac{1}{2} m_A (v_A')^2 - m_k m_A g (12) = 0$$

$$(v_A')^2 = (2)(12 \text{ ft})(0.3)(32.2 \text{ ft/s}^2)$$

$$= 231.84 \text{ ft/s}^2$$

$$v_A' = 15.226 \text{ ft/s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.174 (Continued)

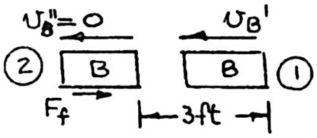
Car B (after impact):



$$T_1 = \frac{1}{2} m_B (v_B')^2$$
$$T_2 = 0$$
$$U_{1-2} = \mu_k\, m_B\, g(3)$$
$$T_1 + U_{1-2} = T_2$$
$$\frac{1}{2} m_B (v_B')^2 - \mu_k m_B g(3)$$
$$v_B'^2 = (2)(3 \text{ ft})(0.3)(32.2 \text{ ft/s}^2)$$
$$(v_B')^2 = 57.96 \text{ ft/s}^2$$
$$v_B' = 7.613 \text{ ft/s}$$

From (1)
$$v_B = 7.333 + v_A' + v_B'$$
$$= 7.333 + 15.226 + 7.613$$

$$v_B = 30.2 \text{ ft/s} = 20.6 \text{ mi/h} \blacktriangleleft$$

(b) Relative velocities:

$$\overset{+}{\longleftarrow} \quad (-v_A - v_B)e = v_B' - v_A'$$
$$(-7.333 - 30.2)e = 7.613 - 15.226$$
$$e = \frac{-(7.613)}{-(37.53)} = 0.2028 \qquad e = 0.203 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.175

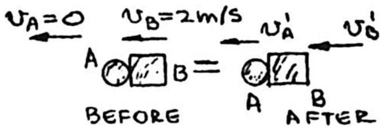
A 1-kg block B is moving with a velocity $\mathbf{v}_0$ of magnitude $v_0 = 2$ m/s as it hits the 0.5-kg sphere A, which is at rest and hanging from a cord attached at O. Knowing that $\mu_k = 0.6$ between the block and the horizontal surface and $e = 0.8$ between the block and the sphere, determine after impact (*a*) the maximum height h reached by the sphere, (*b*) the distance x traveled by the block.

SOLUTION

Velocities just after impact



Total momentum in the horizontal direction is conserved:

$$m_A v_A + m_B v_B = m_A v_A' + m_B v_B'$$

$$0 + (1\text{ kg})(2\text{ m/s}) = (0.5\text{ kg})(v_A') + (1\text{ kg})(v_B')$$

$$4 = v_A' + 2v_B' \qquad (1)$$

Relative velocities:

$$(v_A - v_B)e = (v_B' - v_A')$$

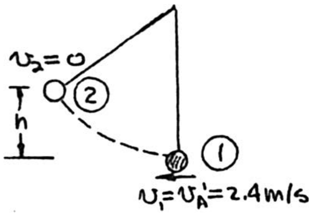
$$(0-2)(0.8) = v_B' - v_A'$$

$$-1.6 = v_B' - v_A' \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously:

$$v_B' = 0.8\text{ m/s}$$

$$v_A' = 2.4\text{ m/s}$$



(*a*) Conservation of energy:

$$T_1 = \frac{1}{2} m_A v_1^2 \quad V_1 = 0$$

$$T_1 = \frac{1}{2} m_A (2.4\text{ m/s})^2 = 2.88 m_A$$

$$T_2 = 0$$

$$V_2 = m_A g h$$

$$T_1 + V_1 = T_2 + V_2 \qquad 2.88 \not{m}_A + 0 = 0 + \not{m}_A (9.81) h$$

$h = 0.294$ m ◀

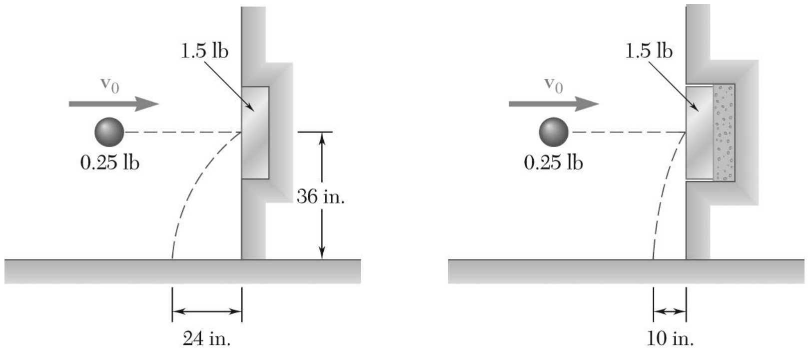
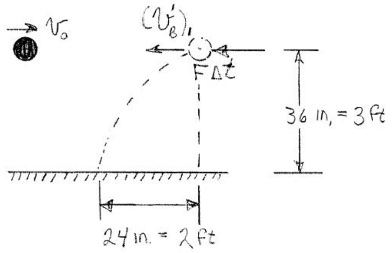
PROBLEM 13.176

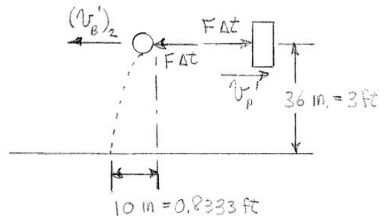
A 0.25-lb ball thrown with a horizontal velocity $\mathbf{v}_0$ strikes a 1.5-lb plate attached to a vertical wall at a height of 36 in. above the ground. It is observed that after rebounding, the ball hits the ground at a distance of 24 in. from the wall when the plate is rigidly attached to the wall (Figure 1) and at a distance of 10 in. when a foam-rubber mat is placed between the plate and the wall (Figure 2). Determine (*a*) the coefficient of restitution *e* between the ball and the plate, (*b*) the initial velocity $\mathbf{v}_0$ of the ball.



(1) (2)

SOLUTION





(*a*) Figure (1), ball alone relative velocities

$$v_0 e = (v_B')_1$$

Projectile motion

$t =$ time for the ball to hit ground

$$2\text{ ft} = v_0 e t \tag{1}$$

Figure (2), ball and plate relative velocities

$$(v_B - v_A)e = v_P' + (v_B')_2$$

$$v_B = v_0, \qquad v_P = 0$$

$$v_0 e = v_P' + (v_B')_2 \tag{2}$$

Conservation of momentum

$$\xrightarrow{+} m_B v_B + m_P v_P = m_B v_B' + m_P v_P'$$

$$\frac{0.25}{g} v_0 + 0 = \frac{0.25}{g}(-v_B')_2 + \frac{1.5}{g} v_P'$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.176 (Continued)

$$0.25v_0 = -0.25(v'_B)_2 + 1.5v'_p \Rightarrow v_0 = -(v'_B)_2 - 6v'_p \qquad (3)$$

Solving (2) and (3) for $(v'_B)_2$, $\qquad (v'_B)_2 = \dfrac{(6e-1)}{7}v_0$

Projectile motion

$$0.8333 = \frac{(6e-1)}{7}v_0 t \qquad (4)$$

Dividing Equation (4) by Equation (1)

$$\frac{0.8333}{2} = \frac{6e-1}{7e};\ 2.91655e = 6e - 1$$

$$e = 0.324 \blacktriangleleft$$

(*b*) From Figure (1)

Projectile motion, $\qquad h = \dfrac{1}{2}gt^2;\ 3 = \dfrac{1}{2}(32.2)t^2$

$$6 = 32.2t^2 \qquad (5)$$

From Equation (1),

$$2 = v_0 et \Rightarrow t = \frac{2}{0.324v_0} = \frac{6.1728}{v_0}$$

Using Equation (5)

$$6 = 32.2\left(\frac{6.1728}{v_0}\right)^2 \Rightarrow 6v_0^2 = 1226.947$$

$$v_0^2 = 204.49$$

$$v_0 = 14.30 \text{ ft/s} \blacktriangleleft$$

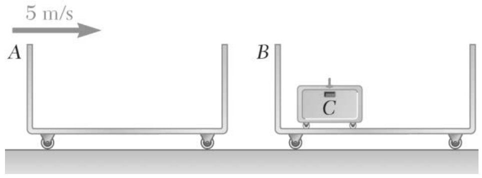
PROBLEM 13.177

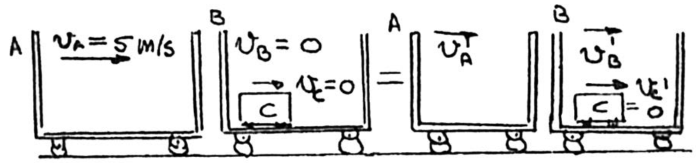


After having been pushed by an airline employee, an empty 40-kg luggage carrier A hits with a velocity of 5 m/s an identical carrier B containing a 15-kg suitcase equipped with rollers. The impact causes the suitcase to roll into the left wall of carrier B. Knowing that the coefficient of restitution between the two carriers is 0.80 and that the coefficient of restitution between the suitcase and the wall of carrier B is 0.30, determine (a) the velocity of carrier B after the suitcase hits its wall for the first time, (b) the total energy lost in that impact.

SOLUTION

(a) Impact between A and B:

Total momentum conserved:



$$m_A v_A + m_B v_B = m_A v_A' + m_B v_B' \qquad m_A = m_B = 40 \text{ kg}$$

$$\xrightarrow{+} 5 \text{ m/s} + 0 = v_A' + v_B' \qquad (1)$$

Relative velocities:

$$(v_A - v_B)e_{AB} = v_B' - v_A'$$

$$(5 - 0)(0.80) = v_B' - v_A' \qquad (2)$$

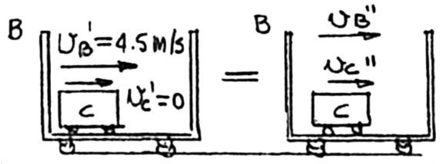
Adding Eqs. (1) and (2)

$$(5 \text{ m/s})(1 + 0.80) = 2v_B'$$

$$v_B' = 4.5 \text{ m/s} \longrightarrow$$

Impact between B and C (after A hits B)

Total momentum conserved:



$$\xrightarrow{+} m_B v_B' + m_C v_C' = m_B v_B'' + m_C v_C''$$

$$(40 \text{ kg})(4.5 \text{ m/s}) + 0 = (40 \text{ kg})\, v_B'' + (15 \text{ kg})\, v_C''$$

$$4.5 = v_B'' + 0.375 v_C'' \qquad (3)$$

Relative velocities:

$$(v_B' - v_C')\, e_{BC} = v_C'' - v_B''$$

$$(4.5 - 0)(0.30) = v_C'' - v_B'' \qquad (4)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.177 (Continued)

Adding Eqs. (4) and (3)

$$(4.5)(1+0.3) = (1.375)v_C''$$

$$v_C'' = 4.2545 \text{ m/s}$$

$$v_B'' = 4.5 - 0.375(4.2545)\, v_B'' = 2.90 \text{ m/s} \qquad v_B' = 2.90 \text{ m/s} \blacktriangleleft$$

(*b*)

$$\Delta T_L = (T_B' + T_C') - (T_B'' + T_C'')$$

$$T_B' = \frac{1}{2} m_B (v_B')^2 = \left(\frac{40}{2} \text{ kg}\right)(4.5 \text{ m/s})^2 = 405 \text{ J}$$

$$T_C' = 0 \qquad T_B'' = \frac{1}{2} m_B (v_B'')^2 = \left(\frac{40}{2} \text{ kg}\right)(2.90)^2 = 168.72 \text{ J}$$

$$T_C'' = \frac{1}{2} m_C (v_C'')^2 = \left(\frac{15}{2} \text{ kg}\right)(4.2545 \text{ m/s})^2 = 135.76 \text{ J}$$

$$\Delta T_L = (405 + 0) - (168.72 + 135.76) = 100.5 \text{ J} \qquad \Delta T_L = 100.5 \text{ J} \blacktriangleleft$$

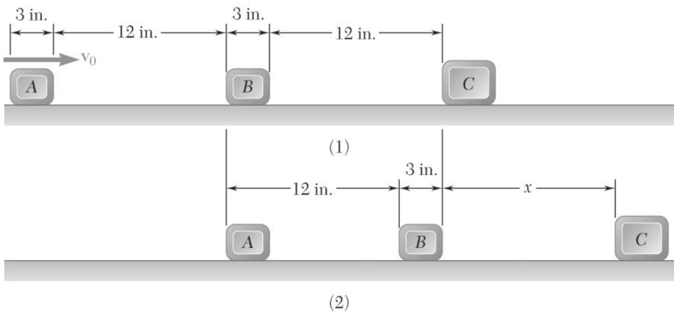
PROBLEM 13.178

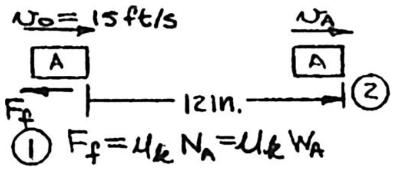


Blocks A and B each weigh 0.8 lb and block C weighs 2.4 lb. The coefficient of friction between the blocks and the plane is $\mu_k = 0.30.$ Initially block A is moving at a speed $v_0 = 15$ ft/s and blocks B and C are at rest (Fig. 1). After A strikes B and B strikes C, all three blocks come to a stop in the positions shown (Fig. 2). Determine (*a*) the coefficients of restitution between A and B and between B and C, (*b*) the displacement x of block C.

SOLUTION

(*a*) Work and energy

Velocity of A just before impact with B:



$$T_1 = \frac{1}{2}\frac{W_A}{g}v_0^2 \qquad T_2 = \frac{1}{2}\frac{W_A}{g}\left(v_A^2\right)_2$$

$$U_{1-2} = -\mu_k W_A\,(1\text{ ft})$$

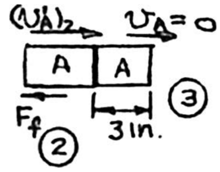
$$T_1 + U_{1-2} = T_2$$

$$\frac{1}{2}\frac{W_A}{g}v_0^2 - \mu_k W_A(1) = \frac{1}{2}\frac{W_A}{g}\left(v_A^2\right)_2$$

$$(v_A^2)_2 = v_0^2 - 2\mu_k g = (15\text{ ft/s})^2 - 2(0.3)(32.2\text{ ft/s}^2)(1\text{ ft})$$

$$(v_A^2)_2 = 205.68\text{ ft/s}^2, \qquad (v_A)_2 = 14.342\text{ ft/s}$$

Velocity of A after impact with B: $\qquad (v_A')_2$



$$T_2' = \frac{1}{2}\frac{W_A}{g}(v_A')_2^2 \qquad T_3 = 0$$

$$U_{2-3} = -\mu_k\, W_A(3/12)$$

$$T_2' + U_{2-3} = T_3, \quad \frac{1}{2}\frac{W_A}{g}(v_A')_2^2 - (\mu_k)(W_A/4) = 0$$

$$(v_A')_2^2 = 2(0.3)(32.2\text{ ft/s}^2)\left(\frac{1}{4}\text{ft}\right) = 4.83\text{ ft}^2/\text{s}^2$$

$$(v_A')_2 = 2.198\text{ ft/s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.179

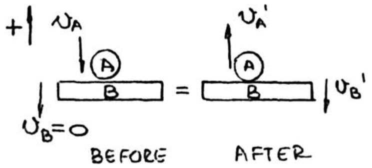
A 0.5-kg sphere A is dropped from a height of 0.6 m onto a 1.0 kg plate B, which is supported by a nested set of springs and is initially at rest. Knowing that the coefficient of restitution between the sphere and the plate is $e = 0.8$, determine (a) the height h reached by the sphere after rebound, (b) the constant k of the single spring equivalent to the given set if the maximum deflection of the plate is observed to be equal to $3h$.

SOLUTION

Velocity of A and B after impact.



$$m_A = 0.5 \text{ kg}$$
$$m_B = 1.0 \text{ kg}$$

<u>Sphere A falls</u>. Use conservation of energy to find v_A, the speed just before impact. Use the plate surface as the datum.

$$T_1 = 0, \quad V_1 = m_A g h_0, \quad T_2 = \frac{1}{2} m_A v_A^2, \quad V_2 = 0$$

$$T_1 + V_1 = T_2 + V_2 \quad 0 + m_A g h_0 = \frac{1}{2} m_A v_A^2 + 0$$

With $\quad h_0 = 0.6$ m,

$$v_A = \sqrt{2 g h_0} = \sqrt{(2)(9.81)(0.6)}$$

$$\mathbf{v}_A = 3.4310 \text{ m/s} \downarrow$$

<u>Analysis of the impact</u>. Conservation of momentum.

$$m_A \mathbf{v}_A + m_B \mathbf{v}_B = m_A \mathbf{v}'_A + m_B \mathbf{v}'_B \quad \text{with} \quad \mathbf{v}_B = 0$$

Dividing by m_A and using y-components $+\uparrow$ with $(m_B/m_A = 2)$

$$-3.4310 + 0 = (v'_A)_y + 2(v'_B)_y \tag{1}$$

<u>Coefficient of restitution</u>. $\quad (v'_B)_y - (v'_A)_y = e[(v_A)_y - (v_B)_y]$

$$(v'_B)_y - (v'_A)_y = e(v_A)_y = -3.4310e \tag{2}$$

Solving Eqs. (1) and (2) simultaneously with $e = 0.8$ gives

$$(v'_A)_y = 0.68621 \text{ m/s}$$

$$(v'_B)_y = -2.0586 \text{ m/s}$$

$$\mathbf{v}'_A = 0.68621 \text{ m/s} \uparrow$$

$$\mathbf{v}'_B = 2.0586 \text{ m/s} \downarrow$$

(*a*) Sphere *A* rises. Use conservation of energy to find *h*.

$$T_1 = \frac{1}{2} m_A (v'_A)^2, \quad V_1 = 0, \quad T_2 = 0, \quad V_2 = m_A g h$$

$$T_1 + V_1 = T_2 + V_2: \qquad \frac{1}{2} m_A (v'_A)^2 + 0 = 0 + m_A g h$$

$$h = \frac{(v'_A)^2}{2g} = \frac{(0.68621)^2}{(2)(9.81)}$$

$h = 0.0240 \text{ m}$ ◀

(*b*) Plate *B* falls and compresses the spring. Use conservation of energy.

Let δ_0 be the initial compression of the spring and Δ be the additional compression of the spring after impact. In the initial equilibrium state,

$$+\uparrow \Sigma F_y = 0: \quad k\delta_0 - W_B = 0 \quad \text{or} \quad k\delta_0 = W_B \tag{3}$$

Just after impact: $T_1 = \frac{1}{2} m_B (v'_B)^2, \quad V_1 = \frac{1}{2} k \delta_0^2$

At maximum deflection of the plate, $T_2 = 0$

$$V_2 = (V_2)_g + (V_2)_e = -W_B \Delta + \frac{1}{2} k (\delta_0 + \Delta)^2$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2} m_B (v'_B)^2 + \frac{1}{2} k \delta_0^2 = 0 - W_B \Delta + \frac{1}{2} k \delta_0^2 + k \delta_0 \Delta + \frac{1}{2} k \Delta^2$$

Invoking the result of Eq. (3) gives

$$\frac{1}{2} m_B (v'_B)^2 = \frac{1}{2} k \Delta^2 \tag{4}$$

Data: $m_B = 1.0 \text{ kg}, \quad v'_B = 2.0586 \text{ m/s}$

$$\Delta = 3h = (3)(0.024) = 0.072 \text{ m}$$

$$k = \frac{m_B (v'_B)^2}{\Delta^2} = \frac{(1.0)(2.0586)^2}{(0.072)^2}$$

$k = 817 \text{ N/m}$ ◀

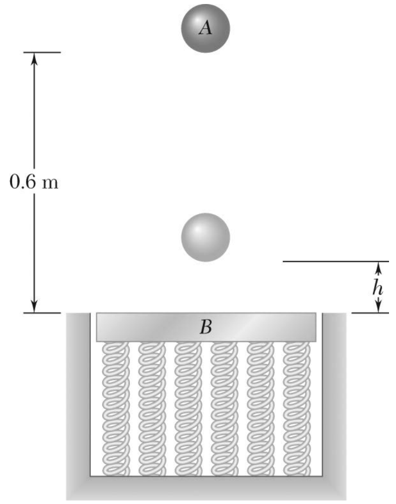
PROBLEM 13.180



A 0.5-kg sphere A is dropped from a height of 0.6 m onto a 1.0-kg plate B, which is supported by a nested set of springs and is initially at rest. Knowing that the set of springs is equivalent to a single spring of constant $k = 900$ N/m, determine (*a*) the value of the coefficient of restitution between the sphere and the plate for which the height h reached by the sphere after rebound is maximum, (*b*) the corresponding value of h, (*c*) the corresponding value of the maximum deflection of the plate.

SOLUTION

$$m_A = 0.5 \text{ kg}$$
$$m_B = 1.0 \text{ kg}$$
$$k = 900 \text{ N/m}$$

Sphere A falls. Use conservation of energy to find v_A, the speed just before impact. Use the plate surface as the datum.

$$T_1 = 0 \qquad V_1 = m_A g h_0$$
$$T_2 = \frac{1}{2} m_A v_A^2, \qquad V_2 = 0$$

With $h_0 = 0.6$ m, $$v_A = \sqrt{2gh_0} = \sqrt{(2)(9.81)(0.6)}$$

$$\mathbf{v}_A = 3.4310 \text{ m/s}\downarrow$$

Analysis of impact. Conservation of momentum.

$$m_A \mathbf{v}_A + m_B \mathbf{v}_B = m_A \mathbf{v}'_A + m_B v'_B \text{ with } \mathbf{v}_B = 0$$

Dividing by m_A and using y components $+\uparrow$ with $(m_B/m_A = 2)$

$$-3.4310 = (v'_A)_y + 2(v'_B)_y \qquad (1)$$

Coefficient of restitution. $$(v'_B)_y - (v'_A)_y = e[(v_A)_y - (v_B)_y]$$

$$(v'_B)_y - (v'_A)_y = e(v_A)_y = -3.4310e$$
$$(v'_B)_y = -3.4310 + (v'_A)_y \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.180 (Continued)

Substituting into Eq. (1),

$$-3.4310 = (v'_A)_y + (2)[-3.4310e + (v'_A)_y]$$

$$(v'_A)_y = 1.1437(2e-1) \qquad (3)$$

From Eq. (2),

$$(v'_B)_y = -1.1437(1+e) \qquad (4)$$

(*a*) <u>Sphere *A* rises</u>. Use conservation of energy to find *h*.

$$T_1 = \frac{1}{2}m_A(v'_A)^2, \qquad V_1 = 0$$

$$T_2 = 0, \qquad V_2 = m_A gh$$

$$T_1 + V_1 = T_2 + V_2: \quad \frac{1}{2}m_A(v'_A)^2 + 0 = 0 + m_A gh$$

$$h = \frac{(v'_A)^2}{2g} = \frac{(1.1437)^2(2e-1)^2}{(2)(9.81)}$$

Since h is to be maximum, e must be as large as possible.

Coefficient of restitution for maximum h: $e = 1.000$ ◀

(*b*) <u>Corresponding value of *h*</u>. $(v'_A) = 1.1437[(2)(1)-1] = 1.1437$ m/s

$$h = \frac{(v'_A)^2}{2g} = \frac{(1.1437)^2}{(2)(9.81)}$$

$h = 0.0667$ m ◀

(*c*) Plate *B* falls and compresses the spring. Use conservation of energy.

Let δ_0 be the initial compression of the spring and Δ be the additional compression of the spring after impact. In the initial equilibrium state,

$$+\uparrow \Sigma F_y = 0 \quad k\delta_0 - W_B = 0 \quad \text{or} \quad k\delta_0 = W_B \qquad (3)$$

Just after impact: $T_1 = \frac{1}{2}m_B(v'_B)^2, \qquad V_1 = \frac{1}{2}k\delta_0^2$

At maximum deflection of the plate, $T_2 = 0$

$$V_2 = (V_2)_g + (V_2)_e = -W_B\Delta + \frac{1}{2}k(\delta_0 + \Delta)^2$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$

$$\frac{1}{2}m_B(v'_B)^2 + \frac{1}{2}k\delta_0^2 = 0 - W_B\Delta + \frac{1}{2}k\delta_0^2 + k\delta_0\Delta + \frac{1}{2}k\Delta^2$$

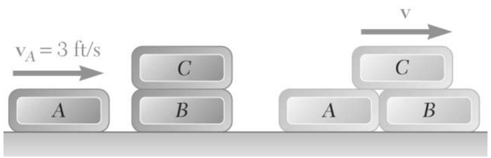
PROBLEM 13.181



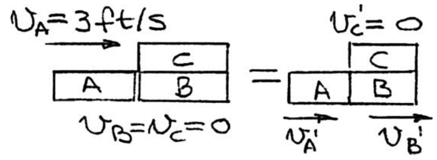
The three blocks shown are identical. Blocks B and C are at rest when block B is hit by block A, which is moving with a velocity $\mathbf{v}_A$ of 3 ft/s. After the impact, which is assumed to be perfectly plastic $(e = 0)$, the velocity of blocks A and B decreases due to friction, while block C picks up speed, until all three blocks are moving with the same velocity $\mathbf{v}$. Knowing that the coefficient of kinetic friction between all surfaces is $\mu_k = 0.20$, determine (a) the time required for the three blocks to reach the same velocity, (b) the total distance traveled by each block during that time.

SOLUTION

(a) Impact between A and B, conservation of momentum

$$mv_A + mv_B + mv_C = mv'_A + mv'_B + mv'_C$$

$$3 + 0 = v'_A + v'_B + 0$$



Relative velocities $(e = 0)$

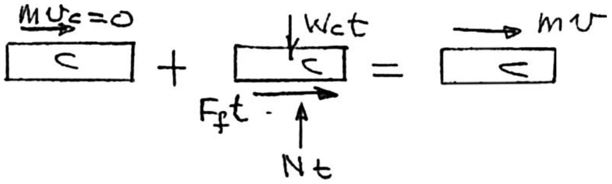
$$(v_A - v_B)e = v'_B - v'_A \qquad 3 = 2v'_B$$

$$0 = v'_B - v'_A \qquad v'_B = 1.5 \text{ ft/s}$$

$$v'_A = v'_B$$

$v =$ Final (common) velocity

Block C: Impulse and momentum

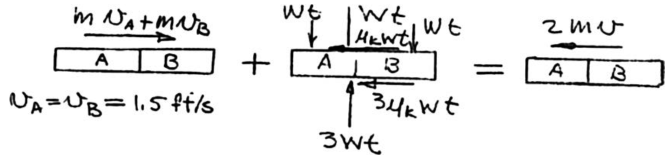


$$\xrightarrow{+} W_C v_C + F_f t = \frac{W_C}{g} v \qquad F_f = \mu_k W_C$$

$$0 + (0.2)t = \frac{v}{g} \qquad v = (0.2)gt \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Blocks A and B: Impulse and momentum



$$2\frac{W}{g}(1.5) - 4(0.2)Wt = 2\frac{W}{g}v$$

$$1.5 - 0.4gt = v \qquad (2)$$

Substitute v from Eq. (1) into Eq. (2)

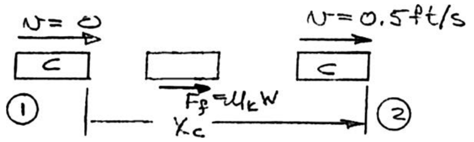
$$1.5 - 0.4gt = 0.2gt$$

$$t = \frac{(1.5 \text{ ft/s})}{0.6(32.2 \text{ ft/s}^2)} \qquad t = 0.0776 \text{ s} \blacktriangleleft$$

(b) Work and energy:

From Eq. (1) $\quad v = (0.2)(32.2)(0.0776) = 0.5$ ft/s

Block C:



$$T_1 = 0 \qquad T_2 = \frac{1}{2}\frac{W}{g}(v)^2 = \frac{W}{2g}(0.5)^2$$

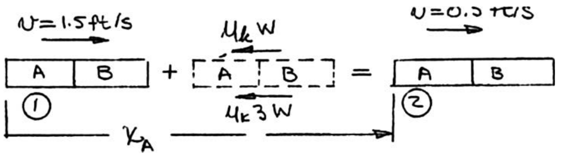
$$U_{1-2} = F_f x_C = \mu_k W x_C = 0.2 W x_C$$

$$T_1 + U_{1-2} = T_2 \qquad 0 + (0.2)(W)x_C = \frac{1}{2}\frac{W}{g}v^2$$

$$x_C = \frac{(0.5 \text{ ft/s})^2}{0.2(2)(32.2 \text{ ft/s}^2)} = 0.01941 \text{ ft}$$

$$x_C = 0.01941 \text{ ft} \blacktriangleleft$$

Blocks A and B:



$$T_1 = \frac{1}{2}\left(2\frac{W}{g}\right)(1.5)^2 = 2.25W \qquad T_2 = \frac{1}{2}\left(2\frac{W}{g}\right)(0.5)^2 = 0.25W$$

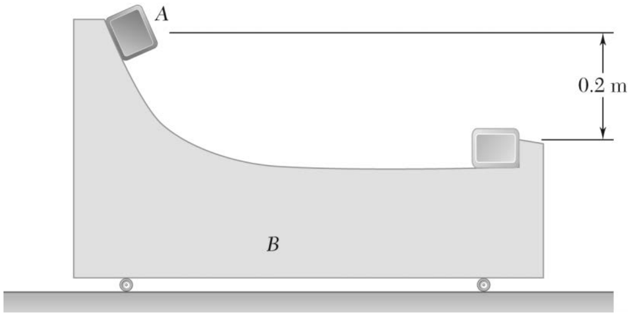
$$U_{1-2} = -4\mu_k W g x_A = -0.8 W g x_A$$

$$T_1 + U_{1-2} = T_2$$

$$2.25W - 4(0.2)W(32.2)x_A = 0.25W$$

$$x_A = 0.07764 \text{ ft} \qquad x_A = 0.0776 \text{ ft} \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.182

Block A is released from rest and slides down the frictionless surface of B until it hits a bumper on the right end of B. Block A has a mass of 10 kg and object B has a mass of 30 kg and B can roll freely on the ground. Determine the velocities of A and B immediately after impact when (a) $e=0$, (b) $e=0.7$.

SOLUTION

Let the x-direction be positive to the right and the y-direction vertically upward.

Let $(v_A)_x$, $(v_A)_y$, $(v_A)_x$ and $(v_B)_y$ be velocity components just before impact and $(v'_A)_x, (v'_A)'_y, (v'_B)_x$, and $(v'_B)_y$ those just after impact. By inspection,

$$(v_A)_y = (v_B)_y = (v'_A)_y = (v'_B)_y = 0$$

<u>Conservation of momentum for x-direction</u>:

While block is sliding down: $\quad 0+0 = m_A(v_A)_x + m_B(v_B)_x \quad (v_B)_x = -\beta(v_A)_x \qquad (1)$

Impact: $\quad 0+0 = m_A(v'_A)_x + m_B(v'_B)_x \quad (v'_B)_x = -\beta(v'_A)_x \qquad (2)$

where $\quad \beta = m_A/m_B$

<u>Conservation of energy during frictionless sliding</u>:

Initial potential energies: $m_A gh$ for A, $\quad$ 0 for B.

Potential energy just before impact: $\quad V_1 = 0$

Initial kinetic energy: $\quad T_0 = 0$ (rest)

Kinetic energy just before impact: $\quad T_1 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2$

$$T_0 + V_0 = T_1 + V_1$$

$$m_A gh = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 = \frac{1}{2}(m_A + m_B\beta^2)v_A^2$$

$$= \frac{1}{2}m_A(1+\beta)v_A^2$$

$$v_A^2 = (v_A)_x^2 = \frac{2gh}{1+\beta} \qquad v_A = \sqrt{\frac{2gh}{1+\beta}} \qquad (3)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.183

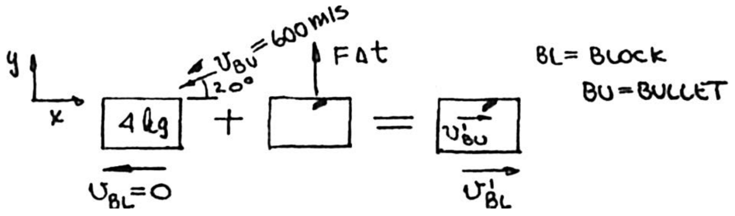
A 20-g bullet fired into a 4-kg wooden block suspended from cords *AC* and *BD* penetrates the block at Point *E*, halfway between *C* and *D*, without hitting cord *BD*. Determine (*a*) the maximum height *h* to which the block and the embedded bullet will swing after impact, (*b*) the total impulse exerted on the block by the two cords during the impact.

SOLUTION



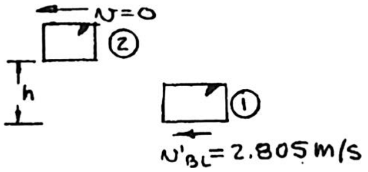
Total momentum in *x* is conserved:

$$\xrightarrow{+} m_{bl}v_{bl} + m_{bu}v_{bu}\cos 20° = m_{bl}v'_{bl} + m_{bu}v'_{bu} \quad (v'_{bl} = v'_{bu})$$

$$0 + (0.02 \text{ kg})(-600 \text{ m/s})(\cos 20) = (4.02 \text{ kg})(v'_{bl})$$

$$v'_{bl} = -2.805 \text{ m/s}$$

Conservation of energy:



$$T_1 = \frac{1}{2}(m_{bl} + m_{bu})(v'_{bl})^2$$

$$T_1 = \left(\frac{4.02 \text{ kg}}{2}\right)(2.805 \text{ m/s})^2$$

$$T_1 = 15.815 \text{ J}$$

$$V_1 = 0$$

$$T_2 = 0 \qquad V_2 = (m_{bl} + m_{bu})gh$$

$$V_2 = (4.02 \text{ kg})(9.81 \text{ m/s}^2)(h) = 39.44h$$

$$T_1 + V_1 = T_2 + V_2$$

$$15.815 + 0 = 0 + 39.44h$$

$$h = 0.401 \text{ m}$$

$h = 401$ mm ◀

(*b*) Refer to figure in part (*a*).

Impulse-momentum in *y*-direction:

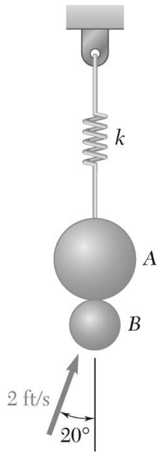
$$+\uparrow m_{bu}v_{bu}\sin 20 + F\Delta t = (m_{bl} + m_{bu})(v'_{bl})_y$$

$$(v_{bl})_y = 0$$

$$(0.02 \text{ kg})(-600 \text{ m/s})(\sin 20°) + F\Delta t = 0$$

$F\Delta t = 4.10$ N·s ◀

If you are a student using this Manual, you are using it without permission.*



PROBLEM 13.184

A 2-lb ball *A* is suspended from a spring of constant 10 lb/in and is initially at rest when it is struck by 1-lb ball *B* as shown. Neglecting friction and knowing the coefficient of restitution between the balls is 0.6, determine (*a*) the velocities of *A* and *B* after the impact, (*b*) the maximum height reached by *A*.

SOLUTION

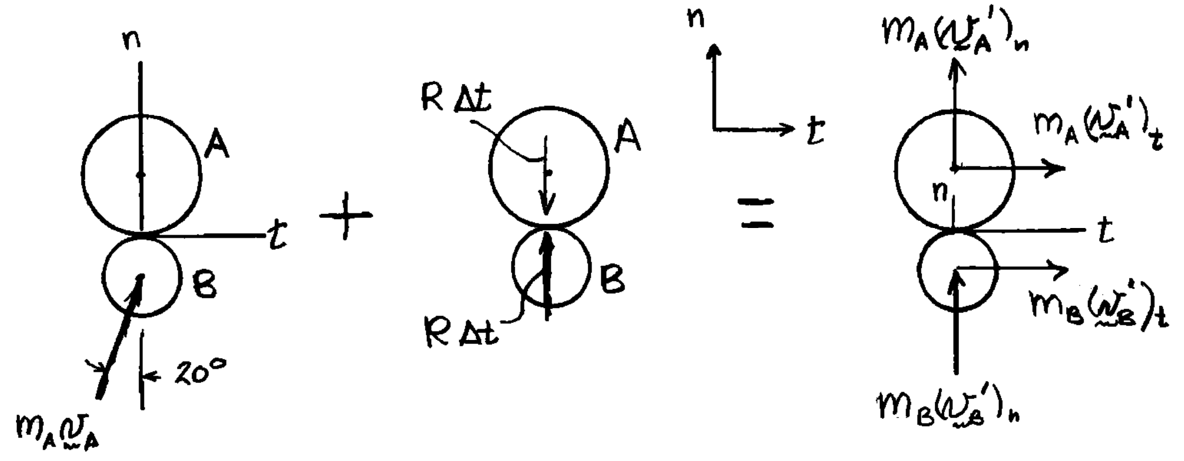
Masses: $m_A = \dfrac{2 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.062112 \text{ lb}\cdot\text{s}^2/\text{ft} \qquad m_B = \dfrac{1 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.031056 \text{ lb}\cdot\text{s}^2/\text{ft}$

Other data: $k = (10 \text{ lb/in.})(12 \text{ in./ft.}) = 120 \text{ lb/ft}, \quad e = 0.6$

$v_A = 0, \quad v_B = 2 \text{ ft/s}$

For analysis of the impact use the principle of impulse and momentum.

$$\Sigma m\mathbf{v}_1 + \Sigma\mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



t-direction for ball *A*:

$$0 + 0 = m_A(v_A')_t \qquad (v_A')_t = 0$$

t-direction for ball *B*: $m_B v_B \sin 20° + 0 = m_B (v_B')_t$

$$(v_B')_t = v_B \sin 20° = (2)(\sin 20°) = 0.6840 \text{ ft/s}$$

PROBLEM 13.185

Ball B is hanging from an inextensible cord. An identical ball A is released from rest when it is just touching the cord and drops through the vertical distance $h_A = 8$ in. before striking ball B. Assuming perfectly elastic impact $(e = 0.9)$ and no friction, determine the resulting maximum vertical displacement h_B of ball B.

SOLUTION

Ball A falls

$$T_1 = 0 \quad V_2 = 0$$

$$T_1 + V_1 = T_2 + V_2 \qquad \text{(Put datum at 2)}$$

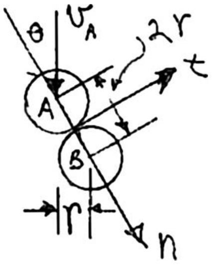
$$h = 8 \text{ in.} = 0.66667 \text{ ft}$$

$$mgh = \frac{1}{2} m v_A^2$$

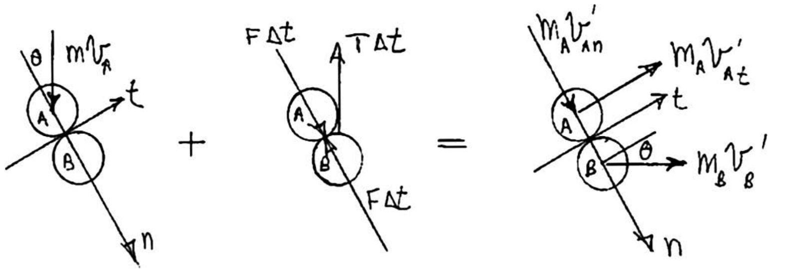
$$v_A = \sqrt{2gh} = \sqrt{(2)(32.2)(0.66667)} = 6.5524 \text{ ft/s}$$

Impact

$$\theta = \sin^{-1} \frac{r}{2r} = 30°$$



Impulse-Momentum



Unknowns: v_B', v_{At}', v_{An}'

x-dir $\longrightarrow$

$$0 + 0 = m_B v_B' + m_A v_{An}' \sin 30° + m_A v_{At}' \cos 30° \qquad (1)$$

Noting that $m_A = m_B$ and dividing by m_A

$$v_B' + v_{An}' \sin 30° + v_{At}' \cos 30° = 0 \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.185 (Continued)

Ball A alone:

<u>Momentum in t-direction</u>:

$$-m_A v_A \sin 30° + 0 = m_A v_{At}$$

$$v'_{At} = -v_A \sin 30° = -6.5524 \sin 30° = -3.2762 \text{ ft/s} \qquad (2)$$

<u>Coefficient of restitution</u>:

$$v'_{Bn} - v'_{An} = e(v_{An} - v_{en})$$

$$v'_B \sin 30° - v'_{An} = 0.9(v_A \cos 30° - 0) \qquad (3)$$

With known value for v_{At}, Eqs. (1) and (3) become

$$v'_B + v'_{An} \sin 30° = 3.2762 \cos 30°$$
$$v'_B \sin 30° - v'_{An} = (0.9)(6.5524) \cos 30°$$

Solving the two equations simultaneously,

$$v'_B = 4.31265 \text{ ft/s}$$
$$v'_{An} = -2.9508 \text{ ft/s}$$

After the impact, ball B swings upward. Using B as a free body

$$T' + V' = T_B + V_B$$

where $$T' = \frac{1}{2} m_B (v'_B)^2,$$
$$V' = 0,$$
$$T_B = 0$$

and $$V_B = m_B g h_B$$

$$\frac{1}{2} m_B (v'_B)^2 = m_B g h_B$$

$$h_B = \frac{1}{2} \frac{(v'_B)^2}{g}$$
$$= \frac{1}{2} \frac{(4.31265)^2}{32.2}$$
$$= 0.2888 \text{ ft}$$

$h_B = 3.47$ in. ◀

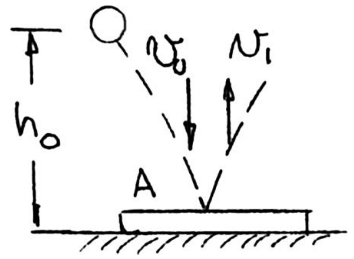
PROBLEM 13.186

A 70 g ball B dropped from a height $h_0 = 1.5\text{ m}$ reaches a height $h_2 = 0.25$ m after bouncing twice from identical 210-g plates. Plate A rests directly on hard ground, while plate C rests on a foam-rubber mat. Determine (a) the coefficient of restitution between the ball and the plates, (b) the height h_1 of the ball's first bounce.

SOLUTION

(a) Plate on hard ground (first rebound):



Conservation of energy:

$$\cancel{\frac{1}{2}m_B v_y^2} + \frac{1}{2}m_B v_0^2 = m_B g h_0 + \cancel{\frac{1}{2}m_B v_x^2}$$

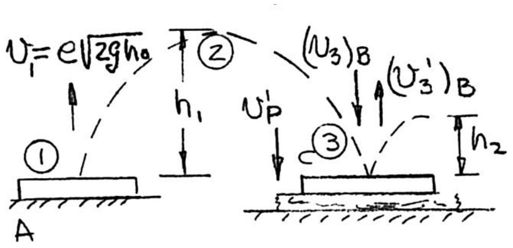
$$v_0 = \sqrt{2gh_0}$$

Relative velocities., n-direction:

$$v_0 e = v_1 \qquad v_1 = e\sqrt{2gh_0}$$

t-direction $\qquad v'_{Bx} = v_{Bx}$

Plate on foam rubber support at C.



Conservation of energy:

Points ① and ③: $\qquad V_1 = V_3 = 0$

$$\cancel{\frac{1}{2}m_B (v'_{Bx})^2} \times \frac{1}{2}m_B v_1^2 = \frac{1}{2}m_B (v_3)_B^2 + \cancel{\frac{1}{2}m_B (v'_{Bx})^2}$$

$$(v_3)_B = e\sqrt{2gh_0}$$

Conservation of momentum:

$\uparrow +$ At ③: $\qquad m_B(-v_3)_B + m_P v_P = m_B(v'_3)_B - m_P v'_P$

$$\frac{m_P}{m_B} = \frac{210}{70} = 3 \qquad -e\sqrt{2gh_0} = (v'_3)_B - 3v'_P \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.186 (Continued)

Relative velocities:

$$[(-v_3)_B - (v_P)]e = -v_P' - (v_3')_B$$

$$e^2\sqrt{2gh_0} + 0 = v_P' + (v_3')_B \qquad (2)$$

Multiplying (2) by 3 and adding to (1)

$$4(v_3')_B = \sqrt{2gh_0}(3e^2 - e)$$

Conservation of energy at ③, $(v_3')_B = \sqrt{2gh_2}$

Thus, $4\sqrt{2gh_2} = \sqrt{2gh_0}(3e^2 - e)$

$$3e^2 - e = 4\sqrt{\frac{h_2}{h_0}} = 4\sqrt{\frac{0.25}{1.5}} = 1.63299$$

$$3e^2 - e - 1.633 = 0 \qquad e = 0.923 \blacktriangleleft$$

(*b*) Points ① and ②:

Conservation of energy.

$$\cancel{\frac{1}{2}m_B(v_{Bx}')^2} + \frac{1}{2}m_B v_1^2 = \cancel{\frac{1}{2}m_B(v_{Bx}')^2}; \quad \frac{1}{2}e^2(2gh_0) = gh_1$$

$$h_1 = e^2 h_0 = (0.923)^2(1.5)$$

$$h_1 = 1.278 \text{ m} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 13.187

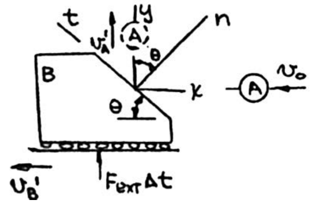
A 700-g sphere A moving with a velocity $\mathbf{v}_0$ parallel to the ground strikes the inclined face of a 2.1-kg wedge B which can roll freely on the ground and is initially at rest. After impact the sphere is observed from the ground to be moving straight up. Knowing that the coefficient of restitution between the sphere and the wedge is $e = 0.6$, determine (a) the angle θ that the inclined face of the wedge makes with the horizontal, (b) the energy lost due to the impact.

SOLUTION



(a) Momentum of sphere A alone is conserved in the t-direction:

$$m_A v_0 \cos\theta = m_A v_A' \sin\theta$$

$$v_0 = v_A' \tan\theta \qquad (1)$$

Total momentum is conserved in the x-direction:

$$m_B v_B + m_A v_0 = m_B v_B' + (v_A')_x$$

$$v_B = 0, \quad (v_A')_x = 0$$

$$0 + 0.700\, v_0 = 2.1 v_B' + 0$$

$$v_B' = v_0/3 \qquad (2)$$

Relative velocities in the n-direction:

$$(-v_0 \sin\theta - 0)e = -v_B' \sin\theta - v_A' \cos\theta$$

$$(v_0)(0.6) = v_B' + v_A' \cot\theta \qquad (3)$$

Substituting v_B' from Eq. (2) into Eq. (3)

$$0.6 v_0 = 0.333\, v_0 + v_A' \cot\theta$$

$$0.267 v_0 = v_A' \cot\theta \qquad (4)$$

Divide (4) into (1)

$$\frac{1}{0.267} = \frac{\tan\theta}{\cot\theta} = \tan^2\theta$$

$$\tan\theta = 1.935 \qquad \theta = 62.7° \blacktriangleleft$$

(b) From (1)

$$v_0 = v_A' \tan\theta = v_A'(1.935)$$

$$v_A' = 0.5168 v_0, \quad v_B' = v_0/3 \qquad (2)$$

$$T_{\text{lost}} = \frac{1}{2} m_A v_A^2 - \frac{1}{2}\left(m_A (v_A')^2 + m_B v_B^2\right)$$

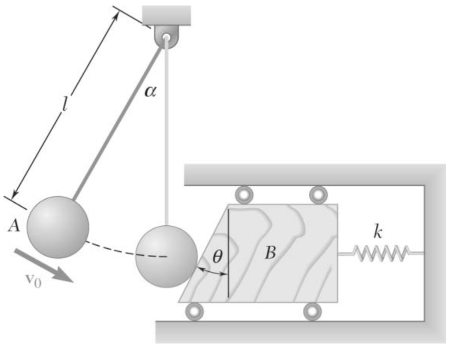
PROBLEM 13.188



When the rope is at an angle of $\alpha = 30°$ the 1-lb sphere A has a speed $v_0 = 4$ ft/s. The coefficient of restitution between A and the 2-lb wedge B is 0.7 and the length of rope $l = 2.6$ ft. The spring constant has a value of 2 lb/in. and $\theta = 20°$. Determine (*a*) the velocities of A and B immediately after the impact, (*b*) the maximum deflection of the spring assuming A does not strike B again before this point.

SOLUTION

Masses: $m_A = (1/32.2)\ \text{lb}\cdot\text{s}^2/\text{ft} \qquad m_B = (2/32.2)\ \text{lb}\cdot\text{s}^2/\text{ft}$

Analysis of sphere A as it swings down:

Initial state: $\alpha = 30°, \quad h_0 = l(1-\cos\alpha) = (2.6)(1-\cos 30°) = 0.34833$ ft

$$V_0 = m_A g h_0 = (1)(0.34833) = 0.34833\ \text{lb}\cdot\text{ft}$$

$$T_0 = \frac{1}{2}m_A v_0^2 = \frac{1}{2}\left(\frac{1.0}{32.2}\right)(4)^2 = 0.24845\ \text{lb}\cdot\text{ft}$$

Just before impact: $\alpha = 0, \quad h_1 = 0, \quad V_1 = 0$

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}\left(\frac{1.0}{32.2}\right)v_A^2 = \left(\frac{1.0}{64.4}\right)v_A^2$$

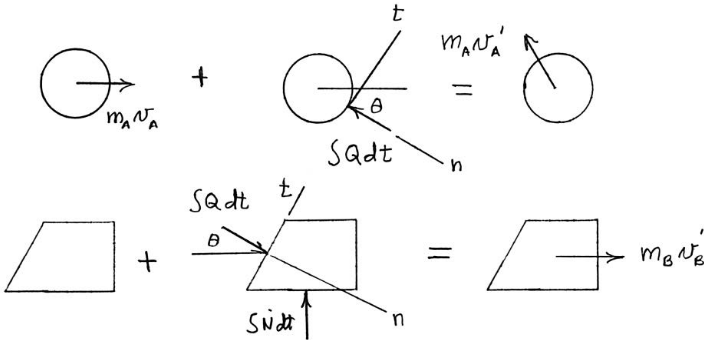
Conservation of energy: $T_0 + V_0 = T_1 + V_1$

$$0.24845 + 0.34833 = \frac{1}{64.4}v_A^2 + 0$$

$$v_A^2 = 38.433\ \text{ft}^2/\text{s}^2$$

$$\mathbf{v}_A = 6.1994\ \text{ft/s} \longrightarrow$$

Analysis of the impact. Use conservation of momentum together with the coefficient of restitution. $e = 0.7$.



Note that the rope does not apply an impulse since it becomes slack.

PROBLEM 13.188 (Continued)

Sphere A: Momentum in t-direction:

$$m_A v_A \sin\theta + 0 = m_A (v'_A)_t$$

$$(v'_A)_t = v_A \sin\theta = 6.1994 \sin 20° = 2.1203 \text{ m/s}$$

$$(\mathbf{v}_A)_t = 2.1203 \text{ m/s} \measuredangle 70°$$

Both A and B: Momentum in x-direction:

$$m_A v_A + 0 = m_A (v'_A)_n \cos\theta + m_A (v'_A)_t \sin\theta + m_B v'_B$$

$$(1/32.2)(6.1994) = (1/32.2)(v_A)_n \cos 20° + (1/32.2)(2.120323) \sin 20° + (2/32.2)v'_B$$

$$(1/32.2)(v'_A)_n \cos 20° + (2/32.2)v'_B = 0.17001 \qquad (1)$$

Coefficient of restitution:

$$(v'_B)_n - (v'_A)_n = e[(v_A)_n - (v_B)_n]$$

$$v'_B \cos\theta - (v'_A)_n = e[v_A \cos\theta - 0]$$

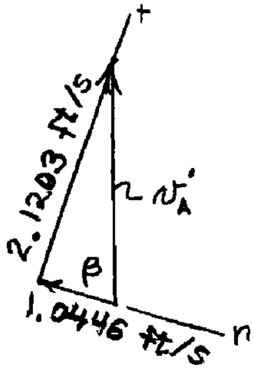
$$v'_B \cos 20° - (v'_A)_n = (0.7)(6.1994) \cos 20° \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously for $(v'_A)_n$ and v'_B,

$$(v'_A)_n = -1.0446 \text{ ft/s}$$

$$v'_B = 3.2279 \text{ ft/s}$$

Resolve $\mathbf{v}_A$ into horizontal and vertical components.



$$\tan\beta = \frac{(v'_A)_t}{-(v'_A)_n} = \frac{2.1203}{1.0446}$$

$$\beta = 63.77° \qquad \beta + 20° = 83.8°$$

$$v'_A = \sqrt{(2.1203)^2 + (1.0446)^2} = 2.3637 \text{ ft/s}$$

(*a*) *Velocities immediately after impact.*

$\mathbf{v}'_A = 2.36$ ft/s ⦪ 83.8° ◀

$\mathbf{v}'_B = 3.23$ ft/s ⟶ ◀

(*b*) *Maximum deflection of wedge B.*

Use conservation of energy: $T_{B1} + V_{B1} = T_{B2} + V_{B2}$

$$T_{B1} = \frac{1}{2} m_B v_B^2$$

$$V_{B1} = 0$$

$$T_{B2} = 0$$

$$V_{B2} = \frac{1}{2} k(\Delta x)^2$$

PROBLEM 13.189

When the rope is at an angle of $\alpha = 30°$ the 1-kg sphere A has a speed $v_0 = 0.6$ m/s. The coefficient of restitution between A and the 2-kg wedge B is 0.8 and the length of rope $l = 0.9$ m The spring constant has a value of 1500 N/m and $\theta = 20°$. Determine, (*a*) the velocities of A and B immediately after the impact (*b*) the maximum deflection of the spring assuming A does not strike B again before this point.

SOLUTION

Masses: $m_A = 1$ kg

$m_B = 2$ kg

<u>Analysis of sphere A as it swings down</u>:

Initial state: $\alpha = 30°, \quad h_0 = l(1-\cos\alpha) = (0.9)(1-\cos 30°) = 0.12058$ m

$$V_0 = m_A g h_0 = (1)(9.81)(0.12058) = 1.1829 \text{ N}\cdot\text{m}$$

$$T_0 = \frac{1}{2}mv_0^2 = \frac{1}{2}(1)(0.6)^2 = 0.180 \text{ N}\cdot\text{m}$$

Just before impact: $\alpha = 0, \quad h_1 = 0, \quad V_1 = 0$

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(1)v_A^2 = 0.5v_A^2$$

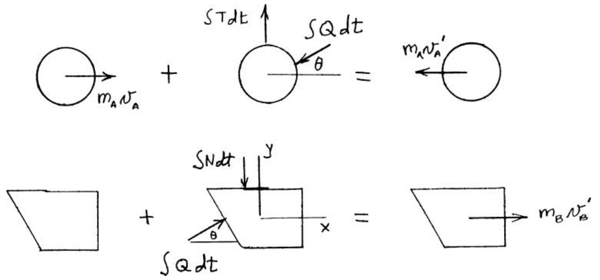
Conservation of energy: $T_0 + V_0 = T_1 + V_1$

$$0.180 + 1.1829 = 0.5v_A^2 + 0$$

$$v_A^2 = 2.7257 \text{ m}^2/\text{s}^2$$

$$\mathbf{v}_A = 1.6510 \text{ m/s} \longrightarrow$$

Analysis of the impact: Use conservation of momentum together with the coefficient of restitution. $e = 0.8$.



Note that the ball rebounds horizontally and that an impulse $\int T dt$ is applied by the rope. Also, an impulse $\int N dt$ is applied to B through its supports.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.190

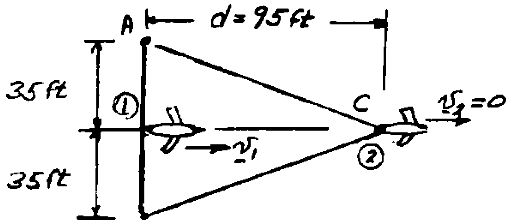
A 32,000-lb airplane lands on an aircraft carrier and is caught by an arresting cable. The cable is inextensible and is paid out at *A* and *B* from mechanisms located below dock and consisting of pistons moving in long oil-filled cylinders. Knowing that the piston-cylinder system maintains a constant tension of 85 kips in the cable during the entire landing, determine the landing speed of the airplane if it travels a distance $d = 95$ ft after being caught by the cable.

SOLUTION

Mass of airplaine: $m = \frac{W}{g} = \frac{32000 \text{ lb}}{32.2 \text{ ft/s}^2} = 993.79 \text{ lb}\cdot\text{s}^2/\text{ft}$



Work of arresting cable force.

$$Q = 85 \text{ kips} = 85000 \text{ lb.}$$

As the cable is pulled out, the cable tension acts paralled to the cable at the airplane hook. For a small displacement

$$\Delta U = -Q(\Delta l_{AC}) - Q(\Delta l_{BC})$$

Since Q is constant,

$$U_{1\to2} = -Q\left[\overline{AC} + \overline{BC} - \overline{AB}\right]$$

For $d = 95$ ft, $\overline{AC} = \overline{BC} = \sqrt{(35)^2 + (95)^2} = 101.24$ ft

$$U_{1\to2} = -(85000)(101.24 + 101.24 - 70) = -11.261 \text{ ft}\cdot\text{lb}$$

Principle of work and energy: $T_1 + U_{1\to2} = T_2$

$$\frac{1}{2}mv_1^2 + U_{1\to2} = \frac{1}{2}mv_2^2$$

Since $v_2 = 0$, we get

$$v_1^2 = -\frac{2U_{1\to2}}{m} = -\frac{(2)(-11.261)}{993.79} = 22.663\times10^3 \text{ ft}^2/\text{s}^2$$

Initial speed: $v_1 = 150.54$ ft/s $\qquad v_1 = 102.6$ mi/h ◀

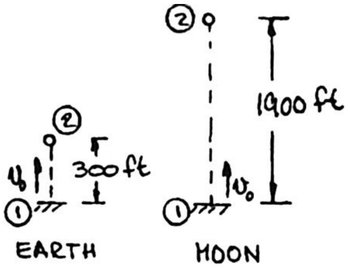
PROBLEM 13.191

A 2-oz pellet shot vertically from a spring-loaded pistol on the surface of the earth rises to a height of 300 ft. The same pellet shot from the same pistol on the surface of the moon rises to a height of 1900 ft. Determine the energy dissipated by aerodynamic drag when the pellet is shot on the surface of the earth. (The acceleration of gravity on the surface of the moon is 0.165 times that on the surface of the earth.)

SOLUTION

Since the pellet is shot from the same pistol the initial velocity v_0 is the same on the moon and on the earth.



Work and energy.

Earth: $$T_1 = \frac{1}{2}mv_0^2$$

$$U_{1-2} = -mg_E(300\text{ ft}) - E_L$$

$$(E_L = \text{ Loss of energy due to drag})$$

Moon: $$T_1 = \frac{1}{2}mv_0^2 \qquad T_2 = 0$$

$$U_{1-2} = -mg_M(1900) \qquad T_1 - 300mg_E - E_L = 0 \qquad (1)$$

$$T_2 = 0$$

$$T_1 - 1900mg_M = 0 \qquad (2)$$

Subtracting (1) from (2) $$-1900mg_M + 300mg_E + E_L = 0$$

$$g_M = 0.165g_E$$

$$m = \frac{(2/16)}{g_E}$$

$$E_L = (1900)\frac{(2/16)}{g_E}(0.165g_E) - 300\frac{(2/16)}{g_E}g_E$$

$$E_L = 1.688\text{ ft}\cdot\text{lb} \blacktriangleleft$$

PROBLEM 13.192

A satellite describes an elliptic orbit about a planet of mass *M*. The minimum and maximum values of the distance *r* from the satellite to the center of the planet are, respectively, r_0 and r_1. Use the principles of conservation of energy and conservation of angular momentum to derive the relation

$$\frac{1}{r_0} + \frac{1}{r_1} = \frac{2GM}{h^2}$$

where *h* is the angular momentum per unit mass of the satellite and *G* is the constant of gravitation.

SOLUTION

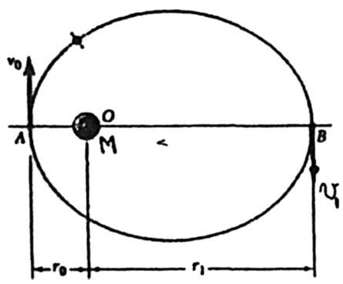
Angular momentum:

$$h = r_0, \quad v_0 = r_1 v_1$$

$$b = r_0 v_0 = r_1 v_1$$

$$v_0 = \frac{h}{r_0} \quad v_1 = \frac{h}{r_1} \qquad (1)$$

Conservation of energy:



$$T_A = \frac{1}{2} m v_0^2$$

$$V_A = -\frac{GMm}{r_0}$$

$$T_B = \frac{1}{2} m v_1^2$$

$$V_B = -\frac{GMm}{r_1}$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2} m v_0^2 - \frac{GMm}{r_0} = \frac{1}{2} m v_1^2 - \frac{GMm}{r_1}$$

$$v_0^2 - v_1^2 = 2GM\left[\frac{1}{r_0} - \frac{1}{r_1}\right] = 2GM\left[\frac{r_1 - r_0}{r_1 r_0}\right]$$

Substituting for v_0 and v_1 from Eq. (1)

$$h^2\left[\frac{1}{r_0^2} - \frac{1}{r_1^2}\right] = 2GM\left[\frac{r_1 - r_0}{r_1 r_0}\right]$$

$$h^2\left[\frac{r_1^2 - r_0^2}{r_1^2 r_0^2}\right] = \frac{h^2}{r_1^2 r_0^2}(r_1 - r_0)(r_1 + r_0) = 2GM\left[\frac{r_1 - r_0}{r_1 r_0}\right]$$

$$h^2\left(\frac{1}{r_0} + \frac{1}{r_1}\right) = 2GM \qquad \left(\frac{1}{r_0} + \frac{1}{r_1}\right) = \frac{2GM}{h^2} \quad \text{Q.E.D.}$$

PROBLEM 13.193

A 60-g steel sphere attached to a 200-mm cord can swing about Point *O* in a vertical plane. It is subjected to its own weight and to a force **F** exerted by a small magnet embedded in the ground. The magnitude of that force expressed in newtons is $F = 3000/r^2$ where *r* is the distance from the magnet to the sphere expressed in millimeters. Knowing that the sphere is released from rest at *A*, determine its speed as it passes through Point *B*.

SOLUTION

Mass and weight: $m = 0.060 \text{ kg}$

$$W = mg = (0.060)(9.81) = 0.5886 \text{ N}$$

Gravitational potential energy: $V_g = Wh$

where *h* is the elevation above level at *B*.

Potential energy of magnetic force:

$$F = \frac{3000}{r^2} = -\frac{dV}{dr} \quad (F, \text{ in newtons, } r \text{ in mm})$$

$$V_m = -\int_\infty^r \frac{3000}{r^2} = \frac{3000}{r} \text{ N} \cdot \text{mm}$$

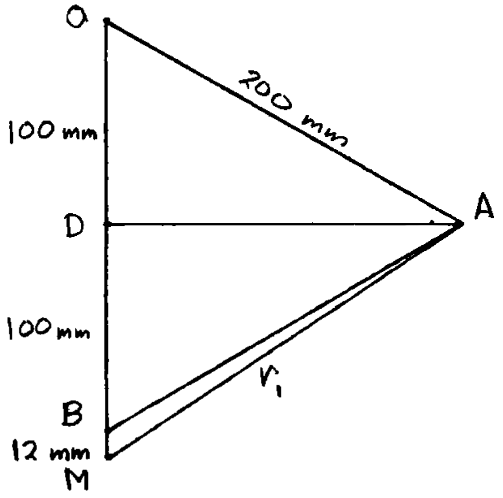
Use conservation of energy: $T_1 + V_1 = T_2 + V_2$

Position 1: (Rest at *A*.)

$$v_1 = 0 \qquad T_1 = 0$$

$$h_1 = 100 \text{ mm}$$

$$(V_g)_1 = (0.5886 \text{ N})(100 \text{ mm}) = 58.86 \text{ N} \cdot \text{mm}$$



From the figure, $\overline{AD}^2 = 200^2 - 100^2 \text{ (mm}^2)$

$$\overline{MD} = 100 + 12 = 112 \text{ mm}$$

$$r_1^2 = \overline{AD}^2 + \overline{MD}^2$$

$$= 200^2 - 100^2 + 112^2$$

$$= 42544 \text{ mm}^2$$

$$r_1 = 206.26 \text{ mm}$$

$$(V_r)_1 = -\frac{3000}{r_1} = -14.545 \text{ N} \cdot \text{mm}$$

$$V_1 = 58.86 - 14.545 = 44.3015 \text{ N} \cdot \text{mm} = 44.315 \times 10^{-3} \text{ N} \cdot \text{m}$$

PROBLEM 13.193 (Continued)

Position 2. (Sphere at Point B.)

$$T_2 = \frac{1}{2}mv_2^2 = \frac{1}{2}(0.060)v_2^2 = 0.030\ v_2^2$$

$$(V_g)_2 = 0 \qquad \text{(since } h_2 = 0\text{)}$$

$$r_2 = \overline{MB} = 12 \text{ mm} \qquad \text{(See figure.)}$$

$$(V_m)_2 = -\frac{3000}{12} = -250 \text{ N}\cdot\text{mm} = -250\times 10^{-3} \text{ N}\cdot\text{mm}$$

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 44.315\times 10^{-3} = 0.030v_2^2 - 250\times 10^{-3}$$

$$v_2^2 = 9.8105 \text{ m}^2/\text{s}^2$$

$v_2 = 3.13$ m/s ◀

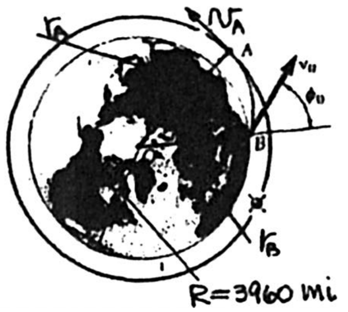
PROBLEM 13.194

A shuttle is to rendezvous with a space station which is in a circular orbit at an altitude of 250 mi above the surface of the earth. The shuttle has reached an altitude of 40 mi when its engine is turned off at Point *B*. Knowing that at that time the velocity $\mathbf{v}_0$ of the shuttle forms an angle $\phi_0 = 55°$ with the vertical, determine the required magnitude of $\mathbf{v}_0$ if the trajectory of the shuttle is to be tangent at *A* to the orbit of the space station.

SOLUTION

<u>Conservation of energy</u>:



$$T_B = \frac{1}{2}mv_0^2 \qquad V_B = -\frac{GMm}{r_B}$$

$$T_A = \frac{1}{2}mv_A^2 \qquad V_A = -\frac{GMm}{r_A}$$

$$GM = gR^2 \quad \text{(Eq. 12.30)}$$

$$T_A + V_A = T_B + V_B$$

$$\frac{1}{2}\cancel{m}v_0^2 - \frac{gR^2}{r_B}\cancel{m} = \frac{1}{2}\cancel{m}v_A^2 \frac{gR^2}{r_A}\cancel{m}$$

$$r_A = 3960 + 250 = 4210 \text{ mi}$$

$$v_A^2 = v_0^2 - \frac{2gR^2}{r_B}\left(1 - \frac{r_B}{r_A}\right)$$

$$r_B = 3960 + 40 = 4000 \text{ mi}$$

$$v_A^2 = v_0^2 - \frac{2(32.2)(3960\times 528)^3}{(4000\times 5280)}\left(1 - \frac{4000}{4210}\right)$$

$$v_A^2 = v_0^2 - 66.495\times 10^6 \qquad (1)$$

<u>Conservation of angular momomentum</u>: $r_A v_A = r_B v_B \sin\phi_0;$

$$v_A = (4000/4210)v_0 \sin 55° = 0.77829\, v_0 \qquad (2)$$

Eqs. (2) and (1) $\quad [1 - (0.77829)^2]\, v_0^2 = 66.495\times 10^6 \qquad v_0 = 12{,}990 \text{ ft/s}$ ◀

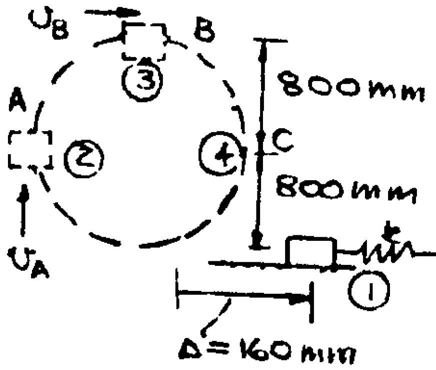
PROBLEM 13.195

A 300-g block is released from rest after a spring of constant $k = 600$ N/m has been compressed 160 mm. Determine the force exerted by the loop *ABCD* on the block as the block passes through (*a*) Point *A*, (*b*) Point *B*, (*c*) Point *C*. Assume no friction.

SOLUTION

Conservation of energy to determine speeds at locations *A*, *B*, and *C*.



Mass: $m = 0.300$ kg

Initial compression in spring: $x_1 = 0.160$ m

Place datum for gravitational potential energy at position 1.

Position 1: $v_1 = 0 \qquad T_1 = \frac{1}{2}mv_1^2 = 0$

$$V_1 = \frac{1}{2}kx_1^2 = \frac{1}{2}(600 \text{ N/m})(0.160 \text{ m})^2 = 7.68 \text{ J}$$

Position 2: $T_2 = \frac{1}{2}mv_A^2 = \frac{1}{2}(0.3)v_A^2 = 0.15v_A^2$

$$V_2 = mgh_2 = (0.3 \text{ kg})(9.81 \text{ m/s}^2)(0.800 \text{ m}) = 2.3544 \text{ J}$$

$$T_1 + V_1 = T_2 + V_2: \quad 0 + 7.68 = 0.15v_A^2 + 2.3544$$

$$v_A^2 = 35.504 \text{ m}^2/\text{s}^2$$

Position 3: $T_3 = \frac{1}{2}mv_B^2 = \frac{1}{2}(0.3)v_B^2 = 0.15v_B^2$

$$V_3 = mgh_3 = (0.3 \text{ kg})(9.81 \text{ m/s}^2)(1.600 \text{ m}) = 4.7088 \text{ J}$$

$$T_1 + V_1 = T_3 + V_3: \quad 0 + 7.68 = 0.15v_B^2 + 4.7088$$

$$v_B^2 = 19.808 \text{ m}^2/\text{s}^2$$

Position 4: $T_2 = \frac{1}{2}mv_C^2 = \frac{1}{2}(0.3)v_C^2 = 0.15v_C^2$

$$V_4 = mgh_4 = (0.3 \text{ kg})(9.81 \text{ m/s})(0.800 \text{ m}) = 2.3544 \text{ J}$$

$$T_1 + V_1 = T_4 + V_4: \quad 0 + 7.68 = 0.15v_C^2 + 2.3544$$

$$v_C^2 = 35.504 \text{ m}^2/\text{s}^2$$

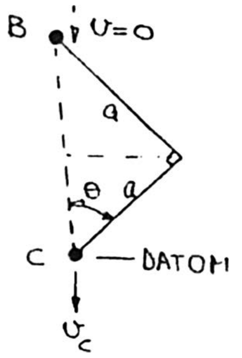
PROBLEM 13.196

A small sphere B of mass m is attached to an inextensible cord of length $2a$, which passes around the fixed peg A and is attached to a fixed support at O. The sphere is held close to the support at O and released with no initial velocity. It drops freely to Point C, where the cord becomes taut, and swings in a vertical plane, first about A and then about O. Determine the vertical distance from line OD to the highest Point C'' that the sphere will reach.

SOLUTION

<u>Velocity at Point C</u> (before the cord is taut).

<u>Conservation of energy from B to C</u>:



$$T_B = 0$$

$$V_B = mg(2)\left(\frac{\sqrt{2}}{2}\right)a = mga\sqrt{2}$$

$$T_C = \frac{1}{2}mv_C^2 \qquad V_C = 0$$

$$T_B + V_B = T_C + V_C$$

$$0 + mga\sqrt{2} = \frac{1}{2}mv_C^2 + 0$$

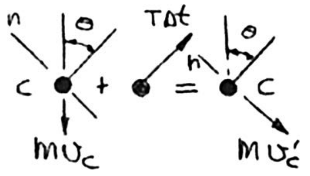
$$v_C = \sqrt{2\sqrt{2}}\,ga$$

<u>Velocity at C</u> (after the cord becomes taut).

<u>Linear momentum perpendicular to the cord is conserved</u>:

$$\theta = 45°$$

$$\nwarrow^{+} \quad -mv_C \sin\theta = mv'_C$$

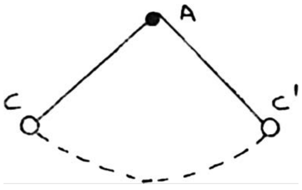


$$v'_C = \left(\sqrt{2\sqrt{2}}\right)\left(\frac{\sqrt{2}}{2}\right)\sqrt{ga}$$

$$v'_C = \sqrt{\sqrt{2}ga} = 2^{\frac{1}{4}}\sqrt{ga}$$

Note: The weight of the sphere is a non-impulsive force.

<u>Velocity at C</u>:



<u>C to C'</u> (conservation of energy): $\quad T_C = \frac{1}{2}m(v'_C)^2 \qquad V_C = 0$

$$T_{C'} = \frac{1}{2}m(v'_{C'})^2 \qquad V_{C'} = 0$$

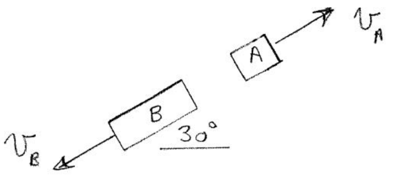
PROBLEM 13.197

A 300-g collar A is released from rest, slides down a frictionless rod, and strikes a 900-g collar B which is at rest and supported by a spring of constant 500 N/m. Knowing that the coefficient of restitution between the two collars is 0.9, determine (a) the maximum distance collar A moves up the rod after impact, (b) the maximum distance collar B moves down the rod after impact.

SOLUTION

After impact



Velocity of A just before impact, v_0

$$v_0 = \sqrt{2gh} = \sqrt{2(9.81\text{ m/s}^2)(1.2\text{ m})\sin 30°}$$

$$= \sqrt{2(9.81)(1.2)(0.5)} = 3.431\text{ m/s}$$

Conservation of momentum

$$\overset{+}{\swarrow}_{30°}\ m_A v_0 = m_B v_B - m_A v_A: \quad 0.3v_0 = 0.9v_B - 0.3v_A \quad (1)$$

Restitution

$$(v_A + v_B) = e(v_0 + 0) = 0.9v_0 \,(2)$$

Substituting for v_B from (2) in (1)

$$0.3v_0 = 0.9(0.9v_0 - v_A) - 0.3v_A \qquad 1.2v_A = 0.51v_0$$

$$v_A = 1.4582\text{ m/s},\ v_B = 1.6297\text{ m/s}$$

(a) A moves up the distance d where:

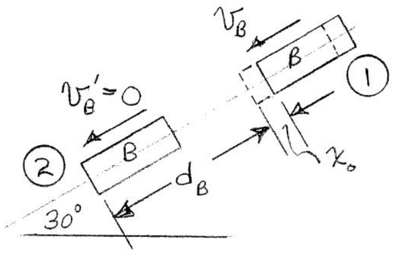
$$\frac{1}{2}\cancel{m_A}v_A^2 = \cancel{m_A}gd\sin 30°; \quad \frac{1}{2}(1.4582\text{ m/s})^2 = (9.81\text{ m/s}^2)d(0.5)$$

$$\nearrow_{30°}\ d_A = 0.21675\text{ m} = 217\text{ mm} \blacktriangleleft$$

(b) Static deflection $= x_0$, B moves down $\swarrow_{30°}^{d_B}$

Conservation of energy (1) to (2)

Position (1) – spring deflected, x_0



$$kx_0 = m_B g\sin 30°$$

$$T_1 + V_1 = T_2 + V_2: \quad T_1 = \frac{1}{2}m_B v_B^2,\ T_2 = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 13.198

Blocks A and B are connected by a cord which passes over pulleys and through a collar C. The system is released from rest when $x = 1.7$ m. As block A rises, it strikes collar C with perfectly plastic impact $(e = 0)$. After impact, the two blocks and the collar keep moving until they come to a stop and reverse their motion. As A and C move down, C hits the ledge and blocks A and B keep moving until they come to another stop. Determine (*a*) the velocity of the blocks and collar immediately after A hits C, (*b*) the distance the blocks and collar move after the impact before coming to a stop, (*c*) the value of x at the end of one compete cycle.

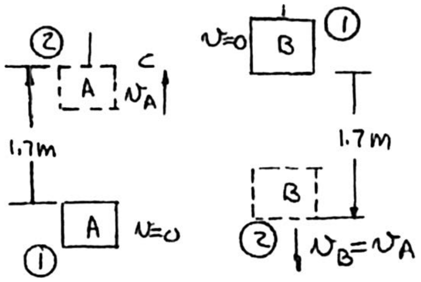
SOLUTION

(*a*) Velocity of A just before it hits C:

Conservations of energy:

Datum at ①:

Position ①:



$$(v_A)_1 = (v_B)_1 = 0$$
$$T_1 = 0$$
$$v_1 = 0$$

Position ②:

$$T_2 = \frac{1}{2}m_A(v_A)^2 + \frac{1}{2}m_B v_B^2$$
$$v_A = v_B \quad \text{(kinematics)}$$
$$T_2 = \frac{1}{2}(5+6)v_A^2 = \frac{11}{2}v_A^2$$
$$V_2 = m_A g(1.7) - m_B g(1.7)$$
$$= (5-6)(g)(1.7)$$
$$V_2 = -1.7g$$
$$T_1 + V_1 = T_2 + V_2$$
$$0 + 0 = \frac{11}{2}v_A^2 - 1.7g$$
$$v_A^2 = \left(\frac{3.4}{11}\right)(9.81)$$
$$= 3.032 \text{ m}^2/\text{s}^2$$
$$v_A = 1.741 \text{ m/s}$$

If you are a student using this Manual, you are using it without permission.*

Position ③:

$T_3 = 0$

$$V_3 = (m_A + m_C)gd - m_B gd$$
$$V_3 = (8-6)gd = 2gd$$

$T_2 + V_2 = T_3 + V_3$

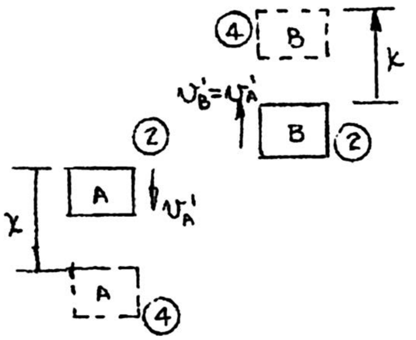
$$13.103 + 0 = 0 + 2gd$$

$$d = (13.103)/(2)(9.81) = 0.6679 \text{ m} \qquad d = 0.668 \text{ m} \blacktriangleleft$$

(*c*) As the system returns to position ② after stopping in position ③, energy is conserved, and the velocities of *A*, *B*, and *C* before the collar at *C* is removed are the same as they were in Part (*a*) above with the directions reversed. Thus, $v'_A = v'_C = v'_B = 1.3679$ m/s. After the collar *C* is removed, the velocities of *A* and *B* remain the same since there is no impulsive force acting on either.

Conversation of energy:

Datum at ②:



$$T_2 = \frac{1}{2}(m_A + m_B)(v'_A)^2$$
$$T_2 = \frac{1}{2}(5+6)(1.3679)^2$$
$$T_2 = 10.291 \text{ J}$$

$V_2 = 0$

$$T_4 = 0 \quad V_4 = m_B gx - m_A gx$$
$$V_4 = (6-5)gx$$

$T_2 + V_2 = T_4 + V_4$

$$10.291 + 0 = (1)(9.81)x$$

$$x = 1.049 \text{ m} \blacktriangleleft$$

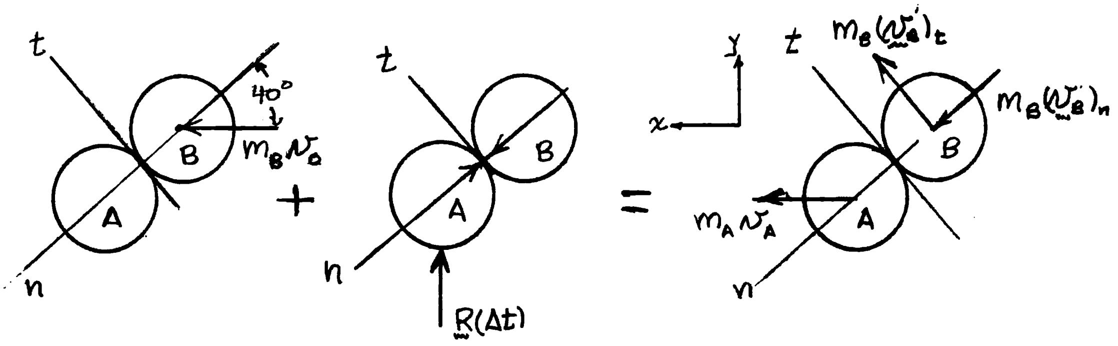
PROBLEM 13.199

A 2-kg ball B is traveling horizontally at 10 m/s when it strikes 2-kg ball A. Ball A is initially at rest and is attached to a spring with constant 100 N/m and an unstretched length of 1.2 m. Knowing the coefficient of restitution between A and B is 0.8 and friction between all surfaces is negligible, determine the normal force between A and the ground when it is at the bottom of the hill.

SOLUTION

Ball B impacts on ball A. Use the principle of impulse and momentum.

$$\Sigma m\mathbf{v}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$



Velocity components: $v_0 = 10$ m/s

$$(v_0)_x = v_0 \quad (v_0)_n = v_0\cos 40° \quad (v_0)_t = v_0 \sin 40°$$
$$(v_A)_x = v_A \quad (v_A)_n = v_A \cos 40°$$
$$(v_B)_x = (v_B)_n \cos 40° + (v_B)_t \sin 40°$$

Impulse-momentum for ball B alone.

t-direction:

$$m_B(v_0)_t = m_B(v_B)_t$$

$$(v_B)_t = (v_0)_t = 10\sin 40° = 6.4279 \text{ m/s} \qquad (1)$$

Impulse-momentum for balls A and B.

x-direction ⟵

$$m_B v_0 + 0 = m_A v_A + m_B(v_B)_x + m_B(v_B)_t$$

$$(2)(10) + 0 = 2v_A + 2[(v_B)_n \cos 40° + 6.4279 \sin 40°]$$

$$2v_A + 2(v_B)_n \cos 40° = 11.7365 \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Coefficient of restitution. $(e = 0.8)$

$$(v_B)_n = (v_A)_n = e[0 - (v_0)_n]$$

$$(v_B)_n - v_A \cos 40° = -(0.8)(10)\cos 40° \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$v_A = 6.6566 \text{ m/s} \qquad (v_B)_n = -1.0291 \text{ m/s}$$

As ball A moves from the impact location to the lowest point on the path, the spring compresses and the elevation decreases. Since friction is negligible, energy is conserved.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}m_A v_A^2 + (V_e)_1 + (V_g)_1 = \frac{1}{2}m_A v_2^2 + (V_e)_2 + (V_g)_2$$

Position 1: (Just after impact.)

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(2)(6.6566)^2 = 44.3101 \text{ J}$$

$(V_e)_1 = 0$ (The spring is unstretched.)

$(V_g)_1 = 0$ (Datum)

Position 2: (Lowest point on path.)

$$T_2 = \frac{1}{2}m_A v_2^2 = \frac{1}{2}(2)v_2^2 = v_2^2$$

For the spring, $x_2 = l_2 - l_0 = 0.4 \text{ m} - 1.2 \text{ m} = 0.8 \text{ m}$

$$F_e = kx_2 = (100)(0.8) = 80 \text{ N}$$

$$(V_2)_e = \frac{1}{2}kx_2^2 = \frac{1}{2}(100)(0.8)^2 = 32 \text{ J}$$

Elevation above datum: $h_2 = -0.4 \text{ m}$

$$(V_2)_g = m_A g\, h_2 = (2)(9.81)(-0.4) = -7.848$$

Conservation of energy:

$$44.310 + 0 + 0 = v_2^2 + 32 - 7.848$$

$$v_2^2 = 20.158 \text{ m}^2/\text{s}^2 \qquad v_2 = 4.489 \text{ m/s}$$

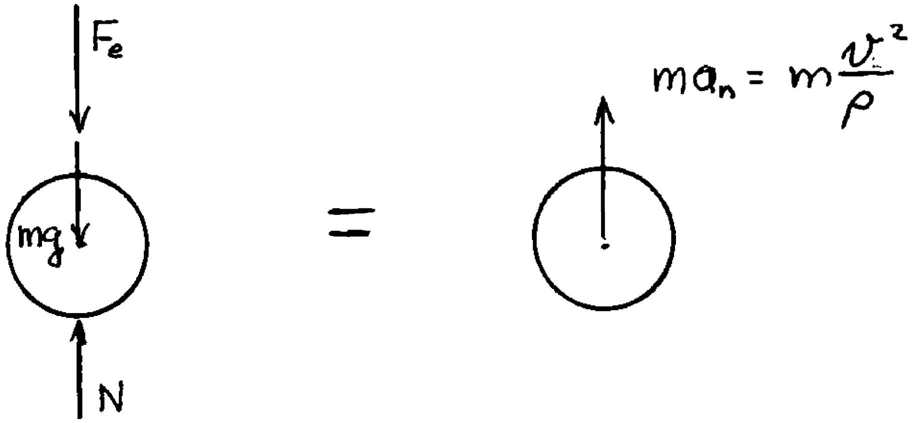
Normal acceleration at lowest point on path:

$$a_n = \frac{v_2^2}{\rho} = \frac{20.158}{0.7} = 28.798 \text{ m/s}^2 \qquad \mathbf{a}_n = 28.8 \text{ m/s}^2 \uparrow$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.199 (Continued)

Apply Newton's second law to the ball.



$$+\uparrow \Sigma F = ma_n: \; N - mg - F_e = ma_n$$

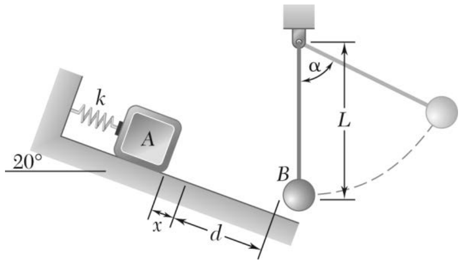
$$N = mg + F_e + ma_n$$

$$= (2)(9.81) + 80 + (2)(28.798)$$

$N = 157.2$ N ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.200



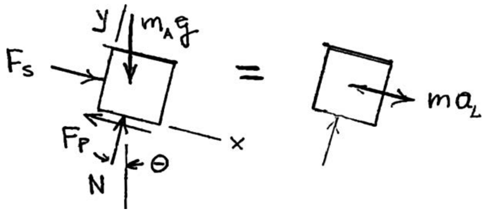
A 2-kg block A is pushed up against a spring compressing it a distance $x = 0.1$ m. The block is then released from rest and slides down the 20° incline until it strikes a 1-kg sphere B which is suspended from a 1 m inextensible rope. The spring constant $k = 800$ N/m, the coefficient of friction between A and the ground is 0.2, the distance A slides from the unstretched length of the spring $d = 1.5$ m and the coefficient of restitution between A and B is 0.8. When $\alpha = 40°$, determine (a) the speed of B (b) the tension in the rope.

SOLUTION

Data: $m_A = 2$ kg, $m_B = 1$ kg, $k = 800$ N/m, $x = 0.1$ m, $d = 1.5$ m

$\mu_k = 0.2$, $e = 0.8$, $\theta = 20°$, $\alpha = 40°$, $l = 1.0$ m

Block slides down the incline:



$$+\nearrow \Sigma F_y = 0$$

$$N - m_A g\cos\theta = 0$$

$$N = m_A g\ \cos\theta$$
$$= (2)(9.81)\cos 20°$$
$$= 18.4368 \text{ N}$$
$$F_f = \mu_k N = (0.2)(18.4368)$$
$$= 3.6874 \text{ N}$$

Use work and energy. Datum for V_g is the impact point near B.

$$T_1 = 0, \quad (V_1)_e = \frac{1}{2}kx_1^2 = \frac{1}{2}(800)(0.1)^2 = 4.00 \text{ J}$$

$$(V_1)_g = m_A g h_1 = m_A g(x+d)\sin\theta = (2)(9.81)(1.6)\sin 20° = 10.7367 \text{ J}$$

$$U_{1\to 2} = -F_f(x+d) = -(3.6874)(1.6) = -5.8998 \text{ J}$$

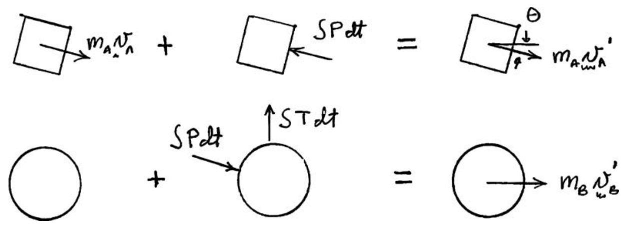
$$T_2 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(1)(v_A^2) = 1.000\, v_A^2 \qquad V_2 = 0$$

$$T_1 + V_1 + U_{1\to 2} = T_2 + V_2: \quad 0 + 4.00 + 10.7367 - 5.8998 = 1.000\, v_A^2 + 0$$

$$v_A^2 = 8.8369 \text{ m}^2/\text{s}^2$$
$$\mathbf{v}_A = 2.9727 \text{ m/s} \searrow 20°$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Impact: Conservation of momentum.



Both A and B, horizontal components $\xrightarrow{+}$:

$$m_A v_A \cos\theta + 0 = m_A v_A' \cos\theta + m_B v_B$$

$$(2)(2.9727)\cos 20° = 2v_A' \cos 20° + (1.00)v_B \qquad (1)$$

Relative velocities:

$$(v_B')_n - (v_A')_n = e[(v_B)_n - (v_A)_n]$$

$$v_B' \cos\theta - v_A' = e[v_A - 0]$$

$$v_B' \cos 20° - v_A' = (0.8)(2.9727) \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$v_A' = 1.0382 \text{ m/s}$$

$$v_B' = 3.6356 \text{ m/s}$$

Sphere B rises: Use conservation of energy.

$$T_1 = \frac{1}{2} m_B (v_B')^2 \quad V_1 = 0$$

$$T_2 = \frac{1}{2} m_B v_2^2 \qquad V_2 = m_B g h_2 = m_B g l(1-\cos\alpha)$$

$$T_1 + V_1 = T_2 + V_2: \quad \frac{1}{2} m_B (v_B')^2 + 0 = \frac{1}{2} m_B v_2^2 + m_B g(1-\cos)$$

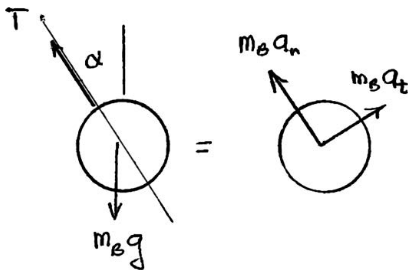
$$v_2^2 = (v_B')^2 - 2gl(1-\cos\alpha)$$

$$= (3.6356)^2 - (2)(9.81)(1-\cos 40°)$$

$$= 8.6274 \text{ m}^2/\text{s}^2$$

(*a*) Speed of B: $v_2 = 2.94$ m/s ◀

(*b*) Tension in the rope: $\rho = 1.00$ m



$$a_n = \frac{v_2^2}{\rho} = \frac{8.6274}{1.00} = 8.6274 \text{ m/s}^2$$

$$+\nwarrow \Sigma F_n = m_B a_n:$$

$$T - m_B g \cos\alpha = m_B a_n$$

$$T = m_B(a_n + g\cos\alpha)$$

$$= (1.0)(8.6274 + 9.81\cos 40°)$$

$T = 16.14$ N ◀

PROBLEM 13.201*

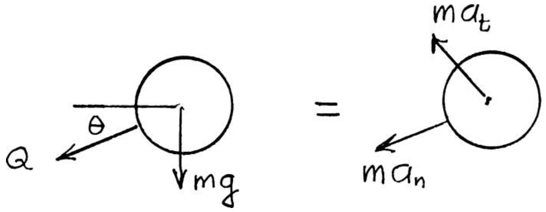
The 2-lb ball at A is suspended by an inextensible cord and given an initial horizontal velocity of $\mathbf{v}_0$. If l = 2 ft, x_B = 0.3 ft and y_B = 0.4 ft determine the initial velocity $\mathbf{v}$ so that the ball will enter in the basket. *Hint*: use a computer to solve the resulting set of equations.

SOLUTION

Let position 1 be at A. $\qquad v_1 = v_0$

Let position 2 be the point described by the angle θ where the path of the ball changes from circular to parabolic. At position 2 the tension Q in the cord is zero.

Relationship between v_2 and θ based on $Q = 0$. Draw the free body diagram.



$$+\swarrow \Sigma F = 0: \quad Q + mg\sin\theta = ma_n = \frac{mv_2^2}{\ell}$$

With $Q = 0$, $\qquad v_2^2 = g\ell\sin\theta \quad \text{or} \quad v_2 = \sqrt{g\ell\sin\theta} \qquad (1)$

Relationship among $v_0, v_2,$ and θ based on conservation of energy.

$$T_1 + V_1 = T_2 + V_2$$

$$\frac{1}{2}mv_0^2 - mg\ell = \frac{1}{2}mv_2^2 + mg\ell\sin\theta$$

$$v_0^2 = v_2^2 + 2g\ell(1+\sin\theta) \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.201* (Continued)

<u>x and y coordinates at position 2</u>:

$$x_2 = \ell\cos\theta \tag{3}$$

$$y_2 = \ell\sin\theta \tag{4}$$

Let t_2 be the time when the ball is in position 2.

<u>Motion on the parabolic path</u>. The horizontal motion is

$$\dot{x} = -v_2\sin\theta$$

$$x = x_2 - (v_2\sin\theta)(t - t_2) \tag{5}$$

At Point B, $x = x_B$ and $t = t_B$. From Eq. (5),

$$(t_B - t_2) = \frac{\ell\cos\theta - x_B}{v_\theta\sin\theta} \tag{6}$$

Vertical motion: $\dot{y} = v_2\cos\theta - g(t - t_2)$

$$y = y_2 + (v_2\cos\theta)(t - t_2) - \frac{1}{2}g(t - t_2)^2$$

At Point B,

$$y_B = \ell\sin\theta + (v_2\cos\theta)(t_B - t_2) - \frac{1}{2}g(t_B - t_2)^2 \tag{7}$$

<u>Data</u>: $\ell = 2$ ft, $x_B = 0.3$ ft, $y_B = 0.4$ ft, $g = 32.2$ ft/s^2

With the numerical data,

Eq. (1) becomes $v_2 = \sqrt{64.4\sin\theta}$ (1)′

Eq. (6) becomes $t_B - t_2 = \dfrac{2\cos\theta - 0.3}{v_2\sin\theta}$ (6)′

Eq. (7) becomes $y_B = 2\sin\theta + (v_2\cos\theta)(t_B - t_2) - 16.1(t_B - t_2)^2$ (7)′

<u>Method of solution</u>. From a trial value of θ, calculate v_2 from Eq. (1)′, $t_B - t_2$ from Eq. (6)′, and y_B from Eq. (7)′. Repeat until $y_B = 0.4$ ft as required.

Try $\theta = 30°$. $v_2 = \sqrt{64.4\sin 30°} = 5.6745$ ft/s

$$t_B - t_2 = \frac{2\cos 30° - 0.3}{5.6745\sin 30°} = 0.50473\text{ s}$$

$$y_B = 2\sin 30° + (5.6745\cos 30°)(0.50473) - (16.1)(0.50473)^2$$
$$= -0.62116\text{ ft}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 13.201* (Continued)

Try $\theta = 45°$.
$$v_2 = \sqrt{64.4 \sin 45°} = 6.7482$$
$$t_B - t_2 = \frac{2\cos 45° - 0.3}{6.7482 \sin 45°} = 0.23351 \text{ s}$$
$$\begin{aligned} y_B &= 2\sin 45° + (6.7482 \cos 45°)(0.23351) - (16.1)(0.23351)^2 \\ &= 1.65060 \text{ ft} \end{aligned}$$

Try $\theta = 37.5°$.
$$v_2 = \sqrt{64.4 \sin 37.5°} = 6.2613 \text{ ft/s}$$
$$t_B - t_2 = \frac{2\cos 37.5° - 0.3}{6.2613 \sin 37.5°} = 0.33757 \text{ s}$$
$$\begin{aligned} y_B &= 2\sin 37.5° + (6.2613 \cos 37.5°)(0.33757) - (16.1)(0.33757)^2 \\ &= 1.05972 \text{ ft} \end{aligned}$$

Let $u = \theta - 30°$. The following sets of data points have be determined:
$$(u,\ y_B) = (0°, -0.62114 \text{ ft}), (7.5°, 1.05972 \text{ ft}), (15°, 1.65060 \text{ ft})$$

The quadratic curve fit of this data gives
$$y_B = -0.62114 + 0.29678\,u - 0.009688711\,u^2$$

Setting $y_B = 0.4$ ft gives the quadratic equation
$$-0.009688711\,u^2 + 0.29678\,u - 1.02114 = 0$$

Solving for u, $\quad u = 3.95° \quad \text{and} \quad 26.68°$

Rejecting the second value gives $\quad \theta = 30° + u = 33.95°$.

Try $\theta = 33.95°$.
$$v_2 = \sqrt{64.4 \sin 33.95°} = 5.997 \text{ ft/s}$$
$$t_B - t_2 = \frac{2\cos 33.95° - 0.3}{5.9971 \sin 33.95°} = 0.40578 \text{ s}$$
$$\begin{aligned} y_B &= 2\sin 33.95° + (5.997 \cos 33.95°)(0.40578) - (16.1)(0.40578)^2 \\ &= 0.48462 \text{ ft} \end{aligned}$$

The new quadratic curve-fit is based on the data points
$$(u,\ y_B) = (0°, -0.62114 \text{ ft}), (3.95°, 0.48462 \text{ ft}), (7.5°, 1.05972 \text{ ft}).$$

The quadratic curve fit of this data is
$$y_B = -0.62114 + 0.342053907\,u - 0.015725232\,u^2$$

Setting $y_B = 0.4$ ft gives
$$-0.015725232\,u^2 + 0.342053907\,u - 1.02114 = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Solving for u,

$$u = 3.572° \qquad \theta = 30° + 3.572° = 33.572°$$

Try $\theta = 33.572°$.

$$v_2 = \sqrt{64.4 \sin 33.572°} = 5.9676 \text{ ft/s}$$

$$t_B - t_2 = \frac{2 \cos 33.572° - 0.3}{5.9676 \sin 33.572°} = 0.41406 \text{ s}$$

$$y_B = 2 \sin 33.572° + (5.9676 \cos 33.572°)(0.41406) - (16.1)(0.41406)^2$$
$$= 0.40445 \text{ ft}$$

which is close enough to 0.4 ft.

Substituting $\theta = 33.572°$ and $v_2 = 5.9676$ ft/s into Eq. (2) along with other data gives

$$v_0^2 = (5.9676)^2 + (2)(32.2)(2)(1 + \sin 33.572°) = 235.64 \text{ ft}^2/\text{s}^2$$

$$\mathbf{v}_0 = 15.35 \text{ ft/s} \longrightarrow \blacktriangleleft$$

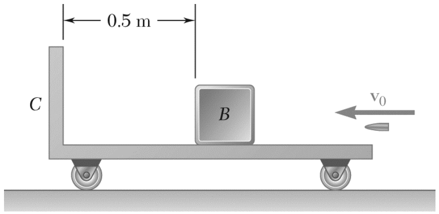
CHAPTER 14



PROBLEM 14.1

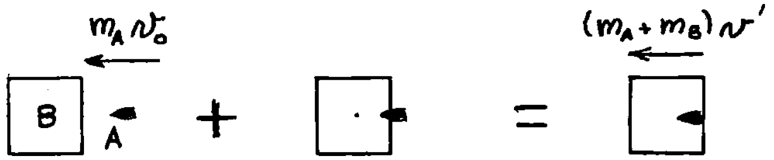
A 30-g bullet is fired with a horizontal velocity of 450 m/s and becomes embedded in block *B* which has a mass of 3 kg. After the impact, block *B* slides on 30-kg carrier *C* until it impacts the end of the carrier. Knowing the impact between *B* and *C* is perfectly plastic and the coefficient of kinetic friction between *B* and *C* is 0.2, determine (*a*) the velocity of the bullet and *B* after the first impact, (*b*) the final velocity of the carrier.

SOLUTION

For convenience, label the bullet as particle *A* of the system of three particles *A*, *B*, and *C*.

(*a*) *Impact between A and B*: Use conservation of linear momentum of *A* and *B*. Assume that the time period is so short that any impulse due to the friction force between *B* and *C* may be neglected.

$$\Sigma m\overline{\mathbf{v}}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\overline{\mathbf{v}}_2$$



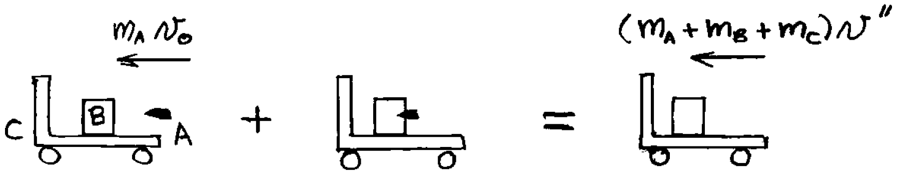
Components ←: $m_A v_0 + 0 = (m_A + m_B)v'$

$$v' = \frac{m_A v_0}{m_A + m_B} = \frac{(30\times 10^{-3}\text{ kg})(450\text{ m/s})}{(30\times 10^{-3}\text{ kg} + 3\text{ kg}} = 4.4554\text{ m/s}$$

$\mathbf{v}' = 4.46$ m/s ← ◀

(*b*) *Final velocity of the carrier*: Particles *A*, *B*, and *C* have the same velocity v'' to the left. Use conservation of linear momentum of all three particles. The friction forces between *B* and *C* are internal forces. Neglect friction at the wheels of the carrier.

$$\Sigma m\overline{\mathbf{v}}_2 + \Sigma \mathbf{Imp}_{2\to 3} = \Sigma m\overline{\mathbf{v}}_3$$



Components ←: $(m_A + m_B)v' + 0 = (m_A + m_B + m_C)v$

$$v'' = \frac{(m_A + m_B)v'}{m_A + m_B + m_C} = \frac{m_A v_0}{m_A + m_B + m_C}$$

$$= \frac{(30\times 10^{-3}\text{ kg})(450\text{ m/s})}{30\times 10^{-3}\text{ kg} + 3\text{ kg} + 30\text{ kg}} = 0.4087\text{ m/s}$$

$\mathbf{v}'' = 0.409$ m/s ← ◀

PROBLEM 14.2

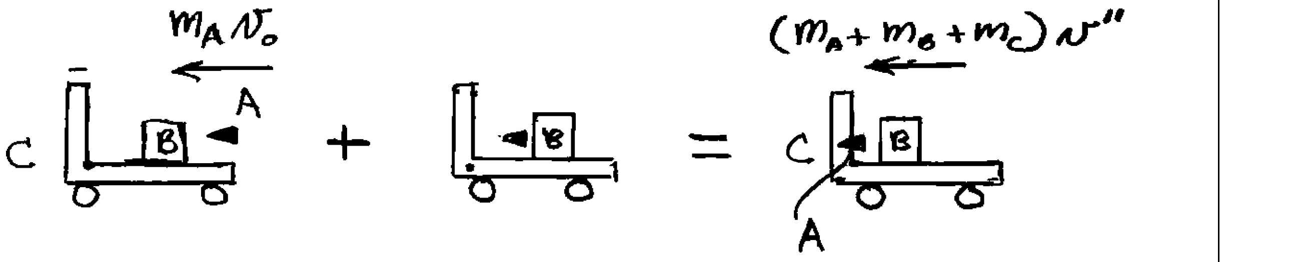
A 30-g bullet is fired with a horizontal velocity of 450 m/s through 3-kg block *B* and becomes embedded in carrier *C* which has a mass of 30 kg. After the impact, block *B* slides 0.3 m on *C* before coming to rest relative to the carrier. Knowing the coefficient of kinetic friction between *B* and *C* is 0.2, determine (*a*) the velocity of the bullet immediately after passing through *B*, (*b*) the final velocity of the carrier.

SOLUTION

For convenience, label the bullet as particle *A* of the system of three particles *A*, *B*, and *C*.

(*b*) *Final velocity of carrier*: Use conservation momentum for all three particles, since the impact forces and the friction force between *B* and *C* are internal forces of the system.

$$\Sigma m\bar{\mathbf{v}}_1 + \Sigma \mathbf{Imp}_{1\to 2} = \Sigma m\bar{\mathbf{v}}_2$$



Components $\longleftarrow$: $\quad m_A v_0 + 0 = (m_A + m_B + m_C)v''$

$$v'' = \frac{m_A v_0}{m_A + m_B + m_C} = \frac{(0.030\text{ kg})(450\text{ m/s})}{33.03\text{ kg}} = 0.40872\text{ m/s}$$

$$\mathbf{v}'' = 0.409\text{ m/s} \longleftarrow \blacktriangleleft$$

(*a*) *Velocity v_A of the bullet*:

The sequence of events described is broken into the following states and processes. The symbols for velocities of *A*, *B*, and *C* at the various states are given in the following table:

State	Symbol for velocity			Process
	A	**B**	**C**	
(1)	v_0	0	0	Initial state
(2)	v_A	v_B	0	1 ⟶ 2: Bullet passes through block
(3)	v_{AC}	v_B	v_{AC}	2 ⟶ 3: Bullet impacts end of carrier
(4)	v''	v''	v''	3 ⟶ 4: Block slides to rest relative to carrier

PROBLEM 14.2 (Continued)

For process 1 ⟶ 2 apply conservation of momentum.

$$m_A v_0 = m_A v_A + m_B v_B \qquad (1)$$

For process 2 ⟶ 3 apply conservation of momentum to A and C.

$$m_A v_A = (m_A + m_C) v_{AC} \qquad (2)$$

For process 3 ⟶ 4 apply conservation of momentum to A, B, and C.

$$(m_A + m_C) v_{AC} + m_B v_B = (m_A + m_B + m_C) v'' \qquad (3)$$

For process 3 ⟶ 4 apply the principle of work and energy, since the work $U_{3\to4}$ of the friction force may be calculated.

Normal force: $N = W_B = m_B g = (3\text{ kg})(9.81\text{ m/s}) = 29.43\text{ N}$

Friction force: $F_f = \mu_k N = (0.2)(29.43) = 5.886\text{ N}$

Work: $U_{3\to4} = -F_f d = -(5.886\text{ N})(0.3\text{ m}) = -1.7658\text{ J}$

Principle of work and energy: $T_{AC} + T_B + U_{3\to4} = T'' \qquad (4)$

where

$$T_{AC} = \frac{1}{2}(m_A + m_C) v_{AC}^2$$

$$T_B = \frac{1}{2} m_B v_B^2$$

$$T'' = \frac{1}{2}(m_A + m_B + m_C)(v'')^2$$

Applying the numerical data gives

$$(0.030)(450) = 0.030 v_A + 3 v_B \qquad (1)'$$

$$0.030 v_A = 30.03 v_{AC} \qquad (2)'$$

$$30.03 v_{AC} + 3 v_B = (33.03)(0.40872) \qquad (3)'$$

$$\frac{1}{2}(30.03) v_{AC}^2 + \frac{1}{2}(3) v_B^2 - 1.7658 = \frac{1}{2}(33.03)(0.40872)^2 \qquad (4)'$$

From Eq. (3)′, $v_{AC} = \dfrac{(33.03)(0.40872) - 3v_B}{30.03} = 0.44955 - 0.0999\, v_B$

Substituting into Eq. (4)′ gives

$$(15.015)(0.44955 - 0.0999 v_B)^2 + 1.5 v_B^2 - 1.7658 = 2.7586$$

which reduces to the quadratic equation

$$1.64985 v_B^2 - 1.34865 v_B - 1.48995 = 0$$

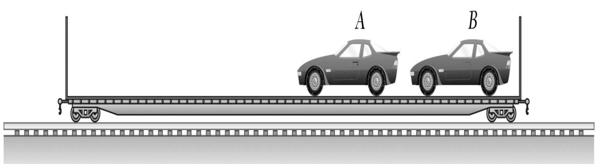
PROBLEM 14.3



Car A weighing 4000 lb and car B weighing 3700 lb are at rest on a 22-ton flatcar which is also at rest. Cars A and B then accelerate and quickly reach constant speeds relative to the flatcar of 7 ft/s and 3.5 ft/s, respectively, before decelerating to a stop at the opposite end of the flatcar. Neglecting friction and rolling resistance, determine the velocity of the flatcar when the cars are moving at constant speeds.

SOLUTION

The masses are $m_A = \dfrac{4000}{32.2} = 124.2$ slugs, $m_B = \dfrac{3700}{32.2} = 114.9$ slugs, and $m_F = \dfrac{(22)(2000)}{32.2} = 1366.5$ slugs

Let v_A, v_B, and v_F be the sought after velocities in ft/s, positive to the right.

Initial values: $(v_A)_0 = (v_B)_0 = (v_F)_0 = 0.$

Initial momentum of system: $m_A(v_A)_0 + m_B(v_B)_0 + m_F(v_F)_0 = 0.$

There are no horizontal external forces acting during the time period under consideration. Momentum is conserved.

$$0 = m_A v_A + m_B v_B + m_F v_F$$

$$124.2 v_A + 114.9 v_B + 1366.5 v_F = 0 \qquad (1)$$

The relative velocities are given as

$$v_{A/F} = v_A - v_F = -7 \text{ ft/s} \qquad (2)$$

$$v_{B/F} = v_B - v_F = -3.5 \text{ ft/s} \qquad (3)$$

Solving (1), (2), and (3) simultaneously,

$$v_A = -6.208 \text{ ft/s},\ v_B = -2.708 \text{ ft/s},\ v_F = 0.7919 \text{ ft/s}$$

$\mathbf{v}_F = 0.792$ ft/s ⟶ ◀

PROBLEM 14.4

A bullet is fired with a horizontal velocity of 1500 ft/s through a 6-lb block *A* and becomes embedded in a 4.95-lb block *B*. Knowing that blocks *A* and *B* start moving with velocities of 5 ft/s and 9 ft/s, respectively, determine (*a*) the weight of the bullet, (*b*) its velocity as it travels from block *A* to block *B*.

SOLUTION

The masses are m for the bullet and m_A and m_B for the blocks.

(*a*) The bullet passes through block *A* and embeds in block *B*. Momentum is conserved.

Initial momentum: $mv_0 + m_A(0) + m_B(0) = mv_0$

Final momentum: $mv_B + m_A v_A + m_B v_B$

Equating, $mv_0 = mv_B + m_A v_A + m_B v_B$

$$m = \frac{m_A v_A + m_B v_B}{v_0 - v_B} = \frac{(6)(5) + (4.95)(9)}{1500 - 9} = 0.0500 \text{ lb}$$

$m = 0.800$ oz ◀

(*b*) The bullet passes through block *A*. Momentum is conserved.

Initial momentum: $mv_0 + m_A(0) = mv_0$

Final momentum: $mv_1 + m_A v_A$

Equating, $mv_0 = mv_1 + m_A v_A$

$$v_1 = \frac{mv_0 - m_A v_A}{m} = \frac{(0.0500)(1500) - (6)(5)}{0.0500} = 900 \text{ ft/s}$$

$\mathbf{v}_1 = 900 \text{ ft/s} \longrightarrow$ ◀

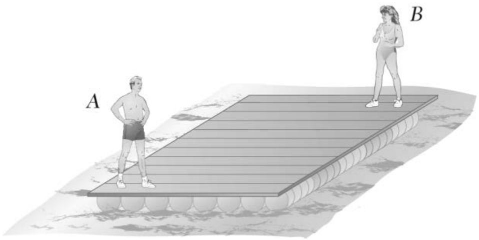
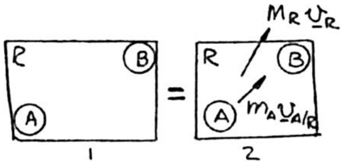
PROBLEM 14.5



Two swimmers A and B, of weight 190 lb and 125 lb, respectively, are at diagonally opposite corners of a floating raft when they realize that the raft has broken away from its anchor. Swimmer A immediately starts walking toward B at a speed of 2 ft/s relative to the raft. Knowing that the raft weighs 300 lb, determine (a) the speed of the raft if B does not move, (b) the speed with which B must walk toward A if the raft is not to move.

SOLUTION



(a) The system consists of A and B and the raft R.

Momentum is conserved.

$$(\Sigma m\mathbf{v})_1 = (\Sigma m\mathbf{v})_2$$

$$0 = m_A \mathbf{v}_A + m_B \mathbf{v}_B + m_R \mathbf{v}_R \qquad (1)$$

$$\mathbf{v}_A = \mathbf{v}_{A/R} + \mathbf{v}_R \qquad \mathbf{v}_B - \mathbf{v}_{B/R} + \mathbf{v}_R \qquad v_{B/R} = 0$$

$$\mathbf{v}_A = 2 \text{ ft/s}\ {}_A\nearrow^B + \mathbf{v}_R \qquad \mathbf{v}_B = \mathbf{v}_R$$

$$0 = m_A[2\ {}_A\nearrow^B + \mathbf{v}_R] + m_B \mathbf{v}_R + m_R \mathbf{v}_e$$

$$\mathbf{v}_R = \frac{-2m_A}{(m_A + m_B + m_R)} = \frac{-(2 \text{ ft/s})(190 \text{ lb})}{(190 \text{ lb} + 125 \text{ lb} + 300 \text{ lb})}$$

$v_R = 0.618$ ft/s ◀

(b) From Eq. (1),

$$0 = m_A v_A + m_B v_B + 0 \qquad (v_R = 0)$$

$$v_B = -\frac{m_A v_A}{m_B} \qquad v_A = v_{A/R} + \cancel{v_R}^{\,0} = 2 \text{ ft/s}$$

$$v_B = -\frac{(2 \text{ ft/s})(190 \text{ lb})}{(125 \text{ lb})} = 3.04 \text{ ft/s}$$

$v_B = 3.04$ ft/s ◀

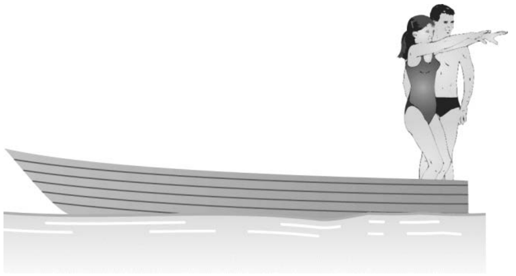
PROBLEM 14.6

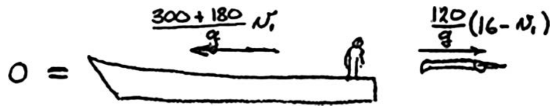


A 180-lb man and a 120-lb woman stand side by side at the same end of a 300-lb boat, ready to dive, each with a 16-ft/s velocity relative to the boat. Determine the velocity of the boat after they have both dived, if (*a*) the woman dives first, (*b*) the man dives first.

SOLUTION

(*a*) Woman dives first.

Conservation of momentum:



$$\frac{120}{g}(16 - v_1) - \frac{300+180}{g}v_1 = 0$$

$$v_1 = \frac{(120)(16)}{600} = 3.20 \text{ ft/s} \longleftarrow$$

Man dives next. Conservation of momentum:

$$-\frac{300+180}{g}v_1 = -\frac{300}{g}v_2 + \frac{180}{g}(16 - v_2)$$

$$v_2 = \frac{480v_1 + (180)(16)}{480} = 9.20 \text{ ft/s}$$

$\mathbf{v}_2 = 9.20 \text{ ft/s} \longleftarrow$ ◀

(*b*) Man dives first.

Conservation of momentum:

$$\frac{180}{g}(16 - v_1') - \frac{300+120}{g}v_1' = 0$$

$$v_1' = \frac{(180)(16)}{600} = 4.80 \text{ ft/s}$$

Woman dives next. Conservation of momentum:

$$-\frac{300+120}{g}v_1' = -\frac{300}{g}v_2' + \frac{120}{g}(16 - v_2')$$

$$v_2' = \frac{420v_1' + (120)(16)}{420} = 9.37 \text{ ft/s}$$

$\mathbf{v}_2' = 9.37 \text{ ft/s} \longleftarrow$ ◀

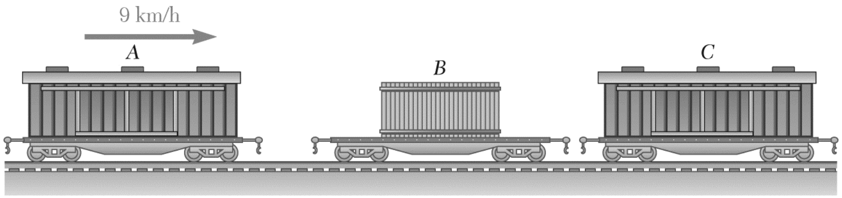
PROBLEM 14.7

A 40-Mg boxcar *A* is moving in a railroad switchyard with a velocity of 9 km/h toward cars *B* and *C*, which are both at rest with their brakes off at a short distance from each other. Car *B* is a 25-Mg flatcar supporting a 30-Mg container, and car *C* is a 35-Mg boxcar. As the cars hit each other they get automatically and tightly coupled. Determine the velocity of car *A* immediately after each of the two couplings, assuming that the container (*a*) does not slide on the flatcar, (*b*) slides after the first coupling but hits a stop before the second coupling occurs, (*c*) slides and hits the stop only after the second coupling has occurred.



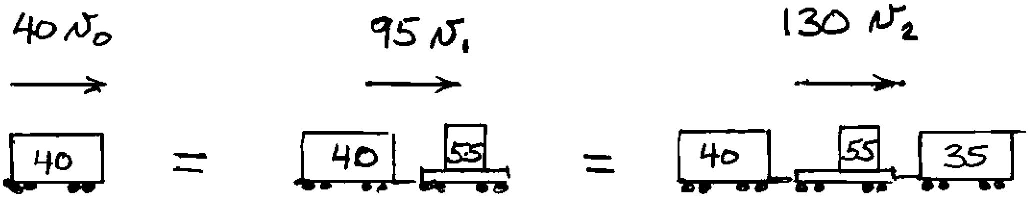
SOLUTION

Each term of the conservation of momentum equation is mass times velocity. As long as the same units are used in all terms, any unit may be used for mass and for velocity. We use Mg for mass and km/h for velocity and apply conservation of momentum.

Note: Only moving masses are shown in the diagrams.

Initial momentum: $m_A v_0 = (40)(9) = 360$

(*a*) Container does not slide

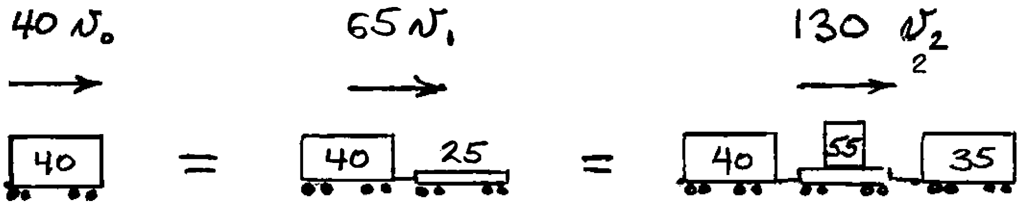


$360 = 95v_1 = 130v_2$

$\mathbf{v}_1 = 3.79$ km/h $\longrightarrow$ ◀

$\mathbf{v}_2 = 2.77$ km/h $\longrightarrow$ ◀

(*b*) Container slides after 1st coupling, stops before 2nd



$360 = 65v_1 = 130v_2$

$\mathbf{v}_1 = 5.54$ km/h $\longrightarrow$ ◀

$\mathbf{v}_2 = 2.77$ km/h $\longrightarrow$ ◀

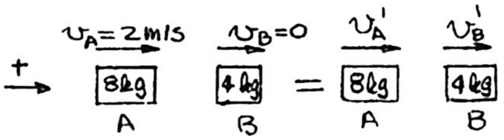
PROBLEM 14.8

Packages in an automobile parts supply house are transported to the loading dock by pushing them along on a roller track with very little friction. At the instant shown, packages *B* and *C* are at rest and package *A* has a velocity of 2 m/s. Knowing that the coefficient of restitution between the packages is 0.3, determine (*a*) the velocity of package *C* after *A* hits *B* and *B* hits *C*, (*b*) the velocity of *A* after it hits *B* for the second time.

SOLUTION

(*a*) Packages *A* and *B*:



Total momentum conserved:

$$m_A v_A + m_B v_B = m_A v'_A + m_B v'_B$$

$$(8 \text{ kg})(2 \text{ m/s}) + 0 = (8 \text{ kg})v'_A + (4 \text{ kg})v'_B$$

$$4 = 2v'_A + v'_B \qquad (1)$$

Relative velocities.

$$(v_A - v_B)e = (v'_B - v'_A)$$

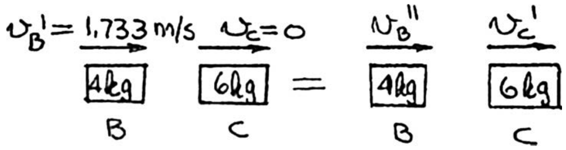
$$(2)(0.3) = v'_B - v'_A \qquad (2)$$

Solving Equations (1) and (2) simultaneously,

$$v'_A = 1.133 \text{ m/s} \longrightarrow$$

$$v'_B = 1.733 \text{ m/s} \longrightarrow$$

Packages *B* and *C*:



$$\xrightarrow{+} m_B v'_B + m_C v_C = m_B v''_B + m_C v'_C$$

$$(4 \text{ kg})(1.733 \text{ m/s}) + 0 = 4v''_B + 6v'_c$$

$$6.932 = 4v''_B + 6v'_C \qquad (3)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.10

For the system of particles of Problem 14.9, determine (*a*) the position vector $\bar{\mathbf{r}}$ of the mass center *G* of the system, (*b*) the linear momentum $m\bar{\mathbf{v}}$ of the system, (*c*) the angular momentum $\mathbf{H}_G$ of the system about *G*. Also verify that the answers to this problem and to problem 14.9 satisfy the equation given in Problem 14.27.

PROBLEM 14.9 A system consists of three particles *A*, *B*, and *C*. We know that $m_A = 3$ kg, $m_B = 2$ kg, and $m_C = 4$ kg and that the velocities of the particles expressed in m/s are, respectively, $\mathbf{v}_A = 4\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$, $\mathbf{v}_B = 4\mathbf{i} + 3\mathbf{j}$, and $\mathbf{v}_C = -2\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}$. Determine the angular momentum $\mathbf{H}_O$ of the system about *O*.

SOLUTION

Position vectors, (meters): $\mathbf{r}_A = 3\mathbf{j}, \quad \mathbf{r}_B = 1.2\mathbf{i} + 2.4\mathbf{j} + 3\mathbf{k}, \quad \mathbf{r}_C = 3.6\mathbf{i}$

(*a*) Mass center: $(m_A + m_B + m_C)\bar{\mathbf{r}} = m_A\mathbf{r}_A + m_B\mathbf{r}_B + m_C\mathbf{r}_C$

$$9\bar{\mathbf{r}} = (3)(3\mathbf{j}) + (2)(1.2\mathbf{i} + 2.4\mathbf{j} + 3\mathbf{k}) + (4)(3.6\mathbf{i})$$

$$\bar{\mathbf{r}} = 1.86667\mathbf{i} + 1.53333\mathbf{j} + 0.66667\mathbf{k}$$

$$\bar{\mathbf{r}} = (1.867 \text{ m})\mathbf{i} + (1.533 \text{ m})\mathbf{j} + (0.667 \text{ m})\mathbf{k} \blacktriangleleft$$

Linear momentum of each particle, (kg·m²/s).

$$m_A\mathbf{v}_A = 12\mathbf{i} + 6\mathbf{j} + 6\mathbf{k}$$

$$m_B\mathbf{v}_B = 8\mathbf{i} + 6\mathbf{j}$$

$$m_C\mathbf{v}_C = -8\mathbf{i} + 16\mathbf{j} + 8\mathbf{k}$$

(*b*) Linear momentum of the system, (kg·m/s.)

$$m\bar{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C = 12\mathbf{i} + 28\mathbf{j} + 14\mathbf{k}$$

$$m\bar{\mathbf{v}} = (12.00 \text{ kg}\cdot\text{m/s})\mathbf{i} + (28.0 \text{ kg}\cdot\text{m/s})\mathbf{j} + (14.00 \text{ kg}\cdot\text{m/s})\mathbf{k} \blacktriangleleft$$

Position vectors relative to the mass center, (meters).

$$\mathbf{r}'_A = \mathbf{r}_A - \bar{\mathbf{r}} = -1.86667\mathbf{i} + 1.46667\mathbf{j} - 0.66667\mathbf{k}$$

$$\mathbf{r}'_B = \mathbf{r}_B - \bar{\mathbf{r}} = -0.66667\mathbf{i} + 0.86667\mathbf{j} + 2.33333\mathbf{k}$$

$$\mathbf{r}'_C = \mathbf{r}_C - \bar{\mathbf{r}} = 1.73333\mathbf{i} - 1.53333\mathbf{j} - 0.66667\mathbf{k}$$

PROBLEM 14.11

A system consists of three particles *A*, *B*, and *C*. We know that $W_A = 5\,\text{lb}$, $W_B = 4\,\text{lb}$, and $W_C = 3\,\text{lb}$, and that the velocities of the particles expressed in ft/s are, respectively, $\mathbf{v}_A = 2\mathbf{i} + 3\mathbf{j} - 2\mathbf{k}$, $\mathbf{v}_B = v_x\mathbf{i} + v_y\mathbf{j} + v_z\mathbf{k}$, and $\mathbf{v}_C = -3\mathbf{i} - 2\mathbf{j} + \mathbf{k}$. Determine (*a*) the components v_x and v_z of the velocity of particle *B* for which the angular momentum $\mathbf{H}_O$ of the system about *O* is parallel to the *x* axis, (*b*) the value of $\mathbf{H}_O$.

SOLUTION

$$\mathbf{H}_O = \Sigma \mathbf{r}_i \times m\mathbf{v}_i = \Sigma m_i \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ x_i & y_i & z_i \\ (v_i)_x & (v_i)_y & (v_i)_z \end{vmatrix}$$

$$= \frac{5}{g}\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 5 & 4 \\ 2 & 3 & -2 \end{vmatrix} + \frac{4}{g}\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 4 & 3 \\ v_x & 2 & v_z \end{vmatrix} + \frac{3}{g}\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 8 & 6 & 0 \\ -3 & -2 & 1 \end{vmatrix}$$

$$= \frac{1}{g}[5(-10-12) + 4(4v_z - 6) + 3(6-0)]\mathbf{i}$$

$$+ \frac{1}{g}[5(8-0) + 4(3v_x - 4v_z) + 3(0-8)]\mathbf{j}$$

$$+ \frac{1}{g}[5(0-10) + 4(8-4v_x) + 3(-16+18)]\mathbf{k}$$

$$\mathbf{H}_O = \frac{1}{g}[(16v_z - 116)\mathbf{i} + (12v_z - 16v_z + 16)\mathbf{j} + (-16v_x - 12)\mathbf{k}] \qquad (1)$$

(*a*) For $\mathbf{H}_O$ to be parallel to the *x* axis, we must have $H_y = H_z = 0$:

$H_z = 0$: $-16v_x - 12 = 0$ $\qquad v_x = -0.75\ \text{ft/s}$ ◀

$H_y = 0$: $12(-0.75) - 16v_z + 16 = 0$ $\qquad v_z = 0.4375\ \text{ft/s}$ ◀

(*b*) Substitute into Eq. (1):

$$\mathbf{H}_O = \frac{1}{g}(16v_z - 116)\mathbf{i} = \frac{1}{g}[16(0.4375) - 116]\mathbf{i} = -\frac{109.0}{32.2}\mathbf{i}$$

$$\mathbf{H}_O = -(3.39\ \text{ft}\cdot\text{lb}\cdot\text{s})\mathbf{i}$$ ◀

PROBLEM 14.13

A system consists of three particles A, B, and C. We know that $m_A = 3$ kg, $m_B = 4$ kg, and $m_C = 5$ kg, and that the velocities of the particles expressed in m/s are, respectively, $\mathbf{v}_A = -4\mathbf{i} + 4\mathbf{j} + 6\mathbf{k}$, $\mathbf{v}_B = -6\mathbf{i} + 8\mathbf{j} + 4\mathbf{k}$, and $\mathbf{v}_C = 2\mathbf{i} - 6\mathbf{j} - 4\mathbf{k}$. Determine the angular momentum $\mathbf{H}_O$ of the system about O.

SOLUTION

Linear momentum of each particle, $(\text{kg}\cdot\text{m/s})$:

$$m_A\mathbf{v}_A = -12\mathbf{i} + 12\mathbf{j} + 18\mathbf{k}$$
$$m_B\mathbf{v}_B = -24\mathbf{i} + 32\mathbf{j} + 16\mathbf{k}$$
$$m_C\mathbf{v}_C = 10\mathbf{i} - 30\mathbf{j} - 20\mathbf{k}$$

Position vectors, (meters):

$$\mathbf{r}_A = 1.2\mathbf{i} + 1.5\mathbf{k}, \quad \mathbf{r}_B = 0.9\mathbf{i} + 1.2\mathbf{j} + 1.2\mathbf{k}, \quad \mathbf{r}_C = 2.4\mathbf{j} + 1.8\mathbf{k}$$

Angular momentum about O, $(\text{kg}\cdot\text{m}^2/\text{s})$:

$$\mathbf{H}_O = \mathbf{r}_A \times m_A\mathbf{v}_A + \mathbf{r}_B \times m_B\mathbf{v}_B + \mathbf{r}_C \times m_C\mathbf{v}_C$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.2 & 0 & 1.5 \\ -12 & 12 & 18 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.9 & 1.2 & 1.2 \\ -24 & 32 & 16 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 2.4 & 1.8 \\ 10 & -30 & -20 \end{vmatrix}$$

$$= (-18\mathbf{i} - 39.6\mathbf{j} + 14.4\mathbf{k}) + (-19.2\mathbf{i} - 43.2\mathbf{j} + 57.6\mathbf{k}) + (6\mathbf{i} + 18\mathbf{j} - 24\mathbf{k})$$

$$= -31.2\mathbf{i} - 64.8\mathbf{j} + 48.0\mathbf{k}$$

$$\mathbf{H}_O = -(31.2\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (64.8\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (48.0\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{k} \ \blacktriangleleft$$

PROBLEM 14.14

For the system of particles of Problem 14.13, determine (*a*) the position vector $\bar{\mathbf{r}}$ of the mass center G of the system, (*b*) the linear momentum $m\bar{\mathbf{v}}$ of the system, (*c*) the angular momentum $\mathbf{H}_G$ of the system about G. Also verify that the answers to this problem and to Problem 14.13 satisfy the equation given in Problem 14.27.

PROBLEM 14.13 A system consists of three particles A, B, and C. We know that $m_A = 3$ kg, $m_B = 4$ kg, and $m_C = 5$ kg and that the velocities of the particles expressed in m/s are, respectively, $\mathbf{v}_A = -4\mathbf{i} + 4\mathbf{j} + 6\mathbf{k}$, $\mathbf{v}_B = -6\mathbf{i} + 8\mathbf{j} + 4\mathbf{k}$, and $\mathbf{v}_C = 2\mathbf{i} - 6\mathbf{j} - 4\mathbf{k}$. Determine the angular momentum $\mathbf{H}_O$ of the system about O.

SOLUTION

Position vectors, (meters):

$$\mathbf{r}_A = 1.2\mathbf{i} + 1.5\mathbf{k}, \quad \mathbf{r}_B = 0.9\mathbf{i} + 1.2\mathbf{j} + 1.2\mathbf{k}, \quad \mathbf{r}_C = 2.4\mathbf{j} + 1.8\mathbf{k}$$

(*a*) Mass center:

$$(m_A + m_B + m_C)\bar{\mathbf{r}} = m_A\mathbf{r}_A + m_B\mathbf{r}_B + m_C\mathbf{r}_C$$

$$12\bar{\mathbf{r}} = (3)(1.2\mathbf{i} + 1.5\mathbf{k}) + (4)(0.9\mathbf{i} + 1.2\mathbf{j} + 1.2\mathbf{k}) + (5)(2.4\mathbf{j} + 1.8\mathbf{k})$$

$$\bar{\mathbf{r}} = 0.6\mathbf{i} + 1.4\mathbf{j} + 1.525\mathbf{k}$$

$$\bar{\mathbf{r}} = (0.600 \text{ m})\mathbf{i} + (1.400 \text{ m})\mathbf{j} + (1.525 \text{ m})\mathbf{k} \quad \blacktriangleleft$$

Linear momentum of each particle, (kg · m/s):

$$m_A\mathbf{v}_A = -12\mathbf{i} + 12\mathbf{j} + 18\mathbf{k}$$

$$m_B\mathbf{v}_B = -24\mathbf{i} + 32\mathbf{j} + 16\mathbf{k}$$

$$m_C\mathbf{v}_C = 10\mathbf{i} - 30\mathbf{j} - 20\mathbf{k}$$

(*b*) Linear momentum of the system, (kg · m/s):

$$m\bar{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C = -26\mathbf{i} + 14\mathbf{j} + 14\mathbf{k}$$

$$m\bar{\mathbf{v}} = -(26.0 \text{ kg}\cdot\text{m/s})\mathbf{i} + (14.00 \text{ kg}\cdot\text{m/s})\mathbf{j} + (14.00 \text{ kg}\cdot\text{m/s})\mathbf{k} \quad \blacktriangleleft$$

Position vectors relative to the mass center, (meters).

$$\mathbf{r}'_A = \mathbf{r}_A - \bar{\mathbf{r}} = 0.6\mathbf{i} - 1.4\mathbf{j} - 0.025\mathbf{k}$$

$$\mathbf{r}'_B = \mathbf{r}_B - \bar{\mathbf{r}} = 0.3\mathbf{i} - 0.2\mathbf{j} - 0.325\mathbf{k}$$

$$\mathbf{r}'_C = \mathbf{r}_C - \bar{\mathbf{r}} = -0.6\mathbf{i} + 1.0\mathbf{j} + 0.275\mathbf{k}$$

PROBLEM 14.14 (Continued)

(*c*) Angular momentum about G, $(\text{kg}\cdot\text{m}^2/\text{s})$:

$$\mathbf{H}_G = \mathbf{r}'_A \times m_A\mathbf{v}_A + \mathbf{r}'_B \times m_B\mathbf{v}_B + \mathbf{r}'_C \times m_C\mathbf{v}_C$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.6 & -1.4 & -0.025 \\ -12 & 12 & 18 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.3 & -0.2 & -0.325 \\ -24 & 32 & 16 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -0.6 & 1.0 & 0.275 \\ 10 & -30 & -20 \end{vmatrix}$$

$$= (-24.9\mathbf{i} - 10.5\mathbf{j} - 9.6\mathbf{k}) + (7.2\mathbf{i} + 3.0\mathbf{j} + 4.8\mathbf{k}) + (-11.75\mathbf{i} - 9.25\mathbf{j} + 8.0\mathbf{k})$$

$$= -29.45\mathbf{i} - 16.75\mathbf{j} + 3.2\mathbf{k}$$

$$\mathbf{H}_G = -(29.5\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (16.75\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (3.20\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{k} \blacktriangleleft$$

$$\bar{\mathbf{r}} \times m\bar{\mathbf{v}} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.6 & 1.4 & 1.525 \\ -26 & 14 & 14 \end{vmatrix} = -1.75\mathbf{i} - 48.05\mathbf{j} + 44.8\mathbf{k}$$

$$\mathbf{H}_G + \bar{\mathbf{r}} \times m\mathbf{v} = -(31.2\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (64.8\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (48.0\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

Angular momentum about O, $(\text{kg}\cdot\text{m}^2/\text{s})$:

$$\mathbf{H}_O = \mathbf{r}_A \times m_A\mathbf{v}_A + \mathbf{r}_B \times m_B\mathbf{v}_B + \mathbf{r}_C \times m_C\mathbf{v}_C$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.2 & 0 & 1.5 \\ -12 & 12 & 18 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.9 & 1.2 & 1.2 \\ -24 & 32 & 16 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 2.4 & 1.8 \\ 10 & -30 & -20 \end{vmatrix}$$

$$= (-18\mathbf{i} - 39.6\mathbf{j} + 14.4\mathbf{k}) + (-19.2\mathbf{i} - 43.2\mathbf{j} + 57.6\mathbf{k}) + (6\mathbf{i} + 18\mathbf{j} - 24\mathbf{k})$$

$$= -(31.2\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (64.8\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (48.0\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

Note that $\mathbf{H}_O = \mathbf{H}_G + \bar{\mathbf{r}} \times m\bar{\mathbf{v}}$.

PROBLEM 14.15

A 13-kg projectile is passing through the origin O with a velocity $\mathbf{v}_0 = (35 \text{ m/s})\mathbf{i}$ when it explodes into two fragments A and B, of mass 5 kg and 8 kg, respectively. Knowing that 3 s later the position of fragment A is (90 m, 7 m, –14 m), determine the position of fragment B at the same instant. Assume $a_y = -g = -9.81 \text{ m/s}^2$ and neglect air resistance.

SOLUTION

Motion of mass center:

It moves as if projectile had not exploded.

$$\overline{\mathbf{r}} = v_0 t\mathbf{i} - \frac{1}{2} g t^2 \mathbf{j}$$

$$= (35 \text{ m/s})(3 \text{ s})\mathbf{i} - \frac{1}{2}(9.81 \text{ m/s}^2)(3 \text{ s})^2 \mathbf{j}$$

$$= (105 \text{ m})\mathbf{i} - (44.145 \text{ m})\mathbf{j}$$

Equation (14.12):

$$m\overline{\mathbf{r}} = \Sigma m_i \mathbf{r}_i:$$

$$m\overline{\mathbf{r}} = m_A \mathbf{r}_A + m_B \mathbf{r}_B$$

$$13(105\mathbf{i} - 44.145\mathbf{j}) = 5(90\mathbf{i} + 7\mathbf{j} - 14\mathbf{k}) + 8\mathbf{r}_B$$

$$8\mathbf{r}_B = (13 \times 105 - 5 \times 90)\mathbf{i}$$

$$+ (-13 \times 44.145 - 5 \times 7)\mathbf{j} + (5 \times 14)\mathbf{k}$$

$$= 915\mathbf{i} - 608.89\mathbf{j} + 70\mathbf{k}$$

$$\mathbf{r}_B = (114.4 \text{ m})\mathbf{i} - (76.1 \text{ m})\mathbf{j} + (8.75 \text{ m})\mathbf{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.16

A 300-kg space vehicle traveling with a velocity $\mathbf{v}_0 = (360 \text{ m/s})\mathbf{i}$ passes through the origin O at $t = 0$. Explosive charges then separate the vehicle into three parts A, B, and C, with mass, respectively, 150 kg, 100 kg, and 50 kg. Knowing that at $t = 4$ s, the positions of parts A and B are observed to be A (1170 m, –290 m, –585 m) and B (1975 m, 365 m, 800 m), determine the corresponding position of part C. Neglect the effect of gravity.

SOLUTION

Motion of mass center:

Since there is no external force,

$$\overline{\mathbf{r}} = \mathbf{v}_0 t = (360 \text{ m/s})\mathbf{i}\,(4 \text{ s}) = (1440 \text{ m})\mathbf{i}$$

Equation (14.12):

$$m\overline{\mathbf{r}} = \Sigma m_i \mathbf{r}_i:$$

$$\begin{aligned}(300)(1440\mathbf{i}) &= (150)(1170\mathbf{i} - 290\mathbf{j} - 585\mathbf{k})\\ &\quad + (100)(1975\mathbf{i} + 365\mathbf{j} + 800\mathbf{k})\\ &\quad + (50)\mathbf{r}_C\end{aligned}$$

$$\begin{aligned}50\mathbf{r}_C &= (300\times 1440 - 150\times 1170 - 100\times 1975)\mathbf{i}\\ &\quad + (150\times 290 - 100\times 365)\mathbf{j} + (150\times 585 - 100\times 800)\mathbf{k}\end{aligned}$$

$$= 59{,}000\mathbf{i} + 7{,}000\mathbf{j} + 7{,}750\mathbf{k}$$

$$\mathbf{r}_C = (1180 \text{ m})\mathbf{i} + (140 \text{ m})\mathbf{j} + (155 \text{ m})\mathbf{k} \blacktriangleleft$$

PROBLEM 14.17

A 2-kg model rocket is launched vertically and reaches an altitude of 70 m with a speed of 30 m/s at the end of powered flight, time $t = 0$. As the rocket approaches its maximum altitude it explodes into two parts of masses $m_A = 0.7\text{ kg}$ and $m_B = 1.3\text{ kg}$. Part A is observed to strike the ground 80 m west of the launch point at $t = 6$ s. Determine the position of part B at that time.

SOLUTION

Choose a planar coordinate system having coordinates x and y with the origin at the launch point on the ground and the x-axis pointing east and the y-axis vertically upward.

Let subscript E refer to the point where the explosion occurs, and A and B refer to the fragments A and B.
Let t be the time elapsed after the explosition.

Motion of the mass center:

$$\bar{x} = x_E + (\bar{v}_x)t = 0$$

$$\bar{y} = y_E + (\bar{v}_y)_0^t - \frac{1}{2}gt^2$$

where $\quad y_E = 70\text{ m} \quad \text{and} \quad (\bar{v}_y)_0 = 30\text{ m/s}$

At $\quad t = 6\text{ s}, \quad \bar{x} = 0$

$$\bar{y} = 70 + (30)(6) - \frac{1}{2}(9.81)(6)^2 = 73.42\text{ m}$$

Definition of mass center:

$$m_A\bar{x} = m_A x_A + m_B x_B$$

$$0 = (0.7\text{ kg})(-80\text{ m}) + (1.3\text{ kg})x_B$$

$$x_B = 43.1\text{ m}$$

$$m\bar{y} = m_A y_A + m_B y_B$$

$$(2\text{ kg})(73.42\text{ m}) = (0.7\text{ kg})(0) + (1.3\text{ kg})y_B$$

$$y_B = 113.0\text{ m}$$

Position of part B: $\quad$ 43.1 m (east), $\quad$ 113.0 m (up) ◀

PROBLEM 14.18

An 18-kg cannonball and a 12-kg cannonball are chained together and fired horizontally with a velocity of 165 m/s from the top of a 15-m wall. The chain breaks during the flight of the cannonballs and the 12-kg cannonball strikes the ground at t = 1.5 s, at a distance of 240 m from the foot of the wall, and 7 m to the right of the line of fire. Determine the position of the other cannonball at that instant. Neglect the resistance of the air.

SOLUTION

Let subscript A refer to the 12-kg cannonball and B to the 18-kg cannonball.

The motion of the mass center of A and B is uniform in the x-direction, uniformly accelerated with acceleration $-g = -9.81\ \text{m/s}^2$ in the y-direction, and zero in the z-direction.

$$\bar{x} = (v_0)_x t = (165\ \text{m/s})(1.5\ \text{s}) = 247.5\ \text{m}$$

$$\bar{y} = \bar{y}_0 + (\bar{v}_0)_y t - \frac{1}{2} g t^2$$

$$= 15\ \text{m} + 0 - \frac{1}{2}(9.81\ \text{m/s}^2)(1.55)^2 = 3.964\ \text{m}$$

$$\bar{z} = 0$$

$$\bar{\mathbf{r}} = (247.5\ \text{m})\mathbf{i} + (3.964\ \text{m})\mathbf{j}$$

Definition of mass center:

$$m\bar{\mathbf{r}} = m_A \mathbf{r}_A + m_B \mathbf{r}_B$$

Data: $m_A = 12$ kg, $m_B = 18$ kg, $m = m_A + m_B = 30$ kg

$t = 1.5$ s, $x_A = 240$ m, $y_A = 0$, $z_A = 7$ m

$$(30)(247.5\mathbf{i} + 3.964\,\mathbf{j}) = (12)(240\mathbf{i} + 7\mathbf{k}) + (18)(x_B\mathbf{i} + y_B\mathbf{j} + z_B\mathbf{k})$$

$\mathbf{i}$: $(30)(247.5) = (12)(240) + 18\,x_B$ $\qquad x_B = 253$ m ◀

$\mathbf{j}$: $(30)(3.964) = (12)(0) + 18\,y_B$ $\qquad y_B = 6.61$ m ◀

$\mathbf{k}$: $(30)(0) = (12)(7) + 18\,z_B$ $\qquad z_B = -4.67$ m ◀

PROBLEM 14.19

Car A was traveling east at high speed when it collided at Point O with car B, which was traveling north at 45 mi/h. Car C, which was traveling west at 60 mi/h, was 32 ft east and 10 ft north of Point O at the time of the collision. Because the pavement was wet, the driver of car C could not prevent his car from sliding into the other two cars, and the three cars, stuck together, kept sliding until they hit the utility pole P. Knowing that the weights of cars A, B, and C are, respectively, 3000 lb, 2600 lb, and 2400 lb, and neglecting the forces exerted on the cars by the wet pavement, solve the problems indicated.

Knowing that the speed of car A was 75 mi/h and that the time elapsed from the first collision to the stop at P was 2.4 s, determine the coordinates of the utility pole P.

SOLUTION

Let t be the time elapsed since the first collision. No external forces in the xy plane act on the system consisting of cars A, B, and C during the impacts with one another. The mass center of the system moves at the velocity it had before the collision.

Setting the origin at O, we can find the initial mass center $\overline{\mathbf{r}}_0$: at the moment of the first collision:

$$(m_A + m_B + m_C)(\overline{x}_0\mathbf{i} + \overline{y}_0\mathbf{j}) = m_A(0) + m_B(0) + m_C(x_C\mathbf{i} + y_C\mathbf{j})$$

$$\overline{x}_0 = 0.3x_C = (0.3)(32) = 9.6 \text{ ft}, \quad \overline{y}_0 = 0.3y_C = (0.3)(10) = 3 \text{ ft}$$

Given velocities:

$$\mathbf{v}_A = (75 \text{ mi/h})\mathbf{i} = (110 \text{ ft/s})\mathbf{i}, \quad \mathbf{v}_B = (45 \text{ mi/h})\mathbf{i} = (66 \text{ ft/s})\mathbf{j}, \quad \mathbf{v}_C = (60 \text{ mi/h})\mathbf{i} = (88 \text{ ft/s})\mathbf{i}$$

Velocity of mass center:

$$(m_A + m_B + m_C)\overline{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

$$\overline{\mathbf{v}} = 0.375\mathbf{v}_A + 0.325\mathbf{v}_B + 0.3\mathbf{v}_C$$

Since the collided cars hit the pole at

$$\mathbf{r}_P = x_P\mathbf{i} + y_P\mathbf{j}$$

$$\mathbf{x}_P\mathbf{i} + y_P\mathbf{j} = \overline{x}_0\mathbf{i} + \overline{y}_0\mathbf{j} + \overline{\mathbf{v}}t \qquad \text{Resolve into components.}$$

$$x: \quad x_P = \overline{x}_0 + 0.375v_At_P - 0.3v_Ct_P \qquad (1)$$

$$y: \quad y_P = \overline{y}_0 + 0.325v_Bt_P \qquad (2)$$

PROBLEM 14.21

An expert archer demonstrates his ability by hitting tennis balls thrown by an assistant. A 2-oz tennis ball has a velocity of (32 ft/s)**i** – (7 ft/s)**j** and is 33 ft above the ground when it is hit by a 1.2-oz arrow traveling with a velocity of (165 ft/s)**j** + (230 ft/s)**k** where **j** is directed upwards. Determine the position *P* where the ball and arrow will hit the ground, relative to Point *O* located directly under the point of impact.

SOLUTION

Assume that the ball and arrow move together after the hit.

Conservation of momentum of ball and arrow during the hit.

$$m_A = \frac{1.2/16}{32.2} = 2.3292\times 10^{-3} \text{ slug} \qquad m_B = \frac{2/16}{32.2} = 3.8820\times 10^{-3} \text{ slug}$$

$$m_A\mathbf{v}_A + m_B\mathbf{v}_B = (m_A + m_B)\overline{\mathbf{v}}$$

$$(2.3292\times 10^{-3})(165\mathbf{j} + 230\mathbf{k}) + (3.8820\times 10^{-3})(32\mathbf{i} - 7\mathbf{j}) = (2.3292\times 10^{-3} + 3.8820\times 10^{-3})\overline{\mathbf{v}}$$

$$\overline{\mathbf{v}} = (20.0 \text{ ft/s})\mathbf{i} + (57.5 \text{ ft/s})\mathbf{j} + (86.25 \text{ ft/s})\mathbf{k}$$

After the hit, the ball and arrow move as a projectile.

Vertical motion:

$$y = y_0 + (v_y)_0 t - \frac{1}{2}gt^2$$

$$y = 33 + 57.5t - \frac{1}{2}(32.2)t^2$$

$y = 0$ at ground.

$$-16.1t^2 + 57.5t + 33 = 0 \qquad \text{Solve for } t.$$

After rejecting the negative root, $t = 4.0745$ s

Horizontal motion:

$$x = x_0 + (v_x)_0 t$$

$$z = z_0 + (v_2)_0 t$$

$$x = 0 + (20)(4.07448)$$

$$= 81.490 \text{ ft}$$

$$z = 0 + (86.25)(4.07448)$$

$$= 351.42 \text{ ft}$$

$$\mathbf{r}_P = (81.5 \text{ ft})\mathbf{i} + (351 \text{ ft})\mathbf{k} \blacktriangleleft$$

PROBLEM 14.22

Two spheres, each of mass m, can slide freely on a frictionless, horizontal surface. Sphere A is moving at a speed $v_0 = 16$ ft/s when it strikes sphere B which is at rest and the impact causes sphere B to break into two pieces, each of mass $m/2$. Knowing that 0.7 s after the collision one piece reaches Point C and 0.9 s after the collision the other piece reaches Point D, determine (a) the velocity of sphere A after the collision, (b) the angle θ and the speeds of the two pieces after the collision.

SOLUTION

Velocities of pieces C and D after impact and fracture.

$$(v'_C)_x = \frac{x_C}{t_C} = \frac{6.3}{0.7} = 9 \text{ ft/s}, \quad (v'_C)_y = 9\tan 30° \text{ ft/s}$$

$$(v'_D)_x = \frac{x_D}{t_D} = \frac{6.3}{0.9} = 7 \text{ ft/s}, \quad (v'_D)_y = -7\tan\theta \text{ ft/s}$$

Assume that during the impact the impulse between spheres A and B is directed along the x-axis. Then, the y component of momentum of sphere A is conserved.

$$0 = m(v'_A)_y$$

Conservation of momentum of system:

$$\xrightarrow{+}: \quad m_A v_0 + m_B(0) = m_A v'_A + m_C(v'_C)_x + m_D(v'_D)_x$$

$$m(16) + 0 = mv'_A + \frac{m}{2}(9) + \frac{m}{2}(7)$$

(a) $\mathbf{v}'_A = 8.00 \text{ ft/s} \longrightarrow$ ◀

$$+\uparrow: \quad m_A(0) + m_B(0) = m_A(v'_A)_y + m_C(v'_C)_y + m_D(v'_D)_y$$

$$0 + 0 = 0 + \frac{m}{2}(9\tan 30°) - \frac{m}{2}(7\tan\theta)$$

(b) $\tan\theta = \frac{9}{7}\tan 30° = 0.7423$ $\qquad \theta = 36.6°$ ◀

$$v_C = \sqrt{(v_C)_x^2 + (v_C)_y^2} = \sqrt{(9)^2 + (9\tan 30°)^2} \qquad v_C = 10.39 \text{ ft/s} ◀$$

$$v_D = \sqrt{(v_D)_x^2 + (v_D)_y^2} = \sqrt{(7)^2 + (7\tan 36.6°)^2} \qquad v_D = 8.72 \text{ ft/s} ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.23

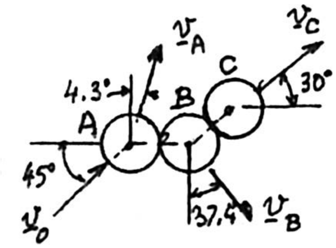
In a game of pool, ball A is moving with a velocity $\mathbf{v}_0$ when it strikes balls B and C which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated, and that $v_0 = 12$ ft/s and $v_C = 6.29$ ft/s, determine the magnitude of the velocity of (a) ball A, (b) ball B.

SOLUTION



Conservation of linear momentum. In x direction:

$$m(12\text{ ft/s})\cos 45° = mv_A \sin 4.3° + mv_B \sin 37.4° + m(6.29)\cos 30°$$

$$0.07498v_A + 0.60738v_B = 3.0380 \quad (1)$$

In y direction:

$$m(12\text{ ft/s})\sin 45° = mv_A \cos 4.3° - mv_B \cos 37.4° + m(6.29)\sin 30°$$

$$0.99719v_A - 0.79441v_B = 5.3403 \quad (2)$$

(a) Multiply (1) by 0.79441, (2) by 0.60738, and add:

$$0.66524v_A = 5.6570 \qquad v_A = 8.50\text{ ft/s} \blacktriangleleft$$

(b) Multiply (1) by 0.99719, (2) by –0.07498, and add:

$$0.66524v_B = 2.6290 \qquad v_B = 3.95\text{ ft/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.24

A 6-kg shell moving with a velocity $\mathbf{v}_0 = (12 \text{ m/s})\mathbf{i} - (9 \text{ m/s})\mathbf{j} - (360 \text{ m/s})\mathbf{k}$ explodes at Point D into three fragments A, B, and C of mass, respectively, 3 kg, 2 kg, and 1 kg. Knowing that the fragments hit the vertical wall at the points indicated, determine the speed of each fragment immediately after the explosion. Assume that elevation changes due to gravity may be neglected.

SOLUTION

Position vectors (m): $\mathbf{r}_D = 4\mathbf{k}$

$$\mathbf{r}_A = -1.5\mathbf{i} \qquad \mathbf{r}_{A/D} = -1.5\mathbf{i} - 4\mathbf{k} \qquad r_{A/D} = 4.272$$

$$\mathbf{r}_B = 4\mathbf{i} + 2\mathbf{j} \qquad \mathbf{r}_{B/D} = 4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k} \qquad r_{B/D} = 6$$

$$\mathbf{r}_C = -3\mathbf{j} \qquad \mathbf{r}_{C/D} = -3\mathbf{j} - 4\mathbf{k} \qquad r_{C/D} = 5$$

Unit vectors:

Along $\mathbf{r}_{A/D}$, $\boldsymbol{\lambda}_A = \dfrac{1}{4.272}(-1.5\mathbf{i} - 4\mathbf{k})$

Along $\mathbf{r}_{B/D}$, $\boldsymbol{\lambda}_B = \dfrac{1}{6}(4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k})$

Along $\mathbf{r}_{C/D}$, $\boldsymbol{\lambda}_C = \dfrac{1}{5}(-3\mathbf{j} - 4\mathbf{k})$

Assume that elevation changes due to gravity may be neglected. Then, the velocity vectors after the explosion have the directions of the unit vectors.

$$\mathbf{v}_A = v_A \boldsymbol{\lambda}_A$$

$$\mathbf{v}_B = v_B \boldsymbol{\lambda}_B$$

$$\mathbf{v}_C = v_C \boldsymbol{\lambda}_C$$

Conservation of momentum: $m\mathbf{v}_0 = m_A \mathbf{v}_A + m_B \mathbf{v}_B + m_C \mathbf{v}_C$

$$6(12\mathbf{i} - 9\mathbf{j} - 360\mathbf{k}) = 3\left(\frac{v_A}{4.272}\right)(-1.5\mathbf{i} - 4\mathbf{k}) + 2\left(\frac{v_B}{6}\right)(4\mathbf{i} + 2\mathbf{j} - 4\mathbf{k})$$

$$+1\left(\frac{v_C}{5}\right)(-3\mathbf{j} - 4\mathbf{k})$$

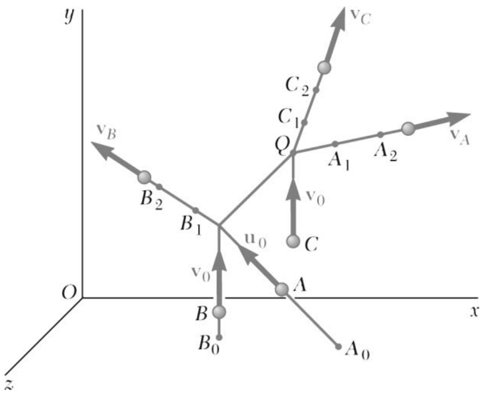
PROBLEM 14.26



In a scattering experiment, an alpha particle A is projected with the velocity $\mathbf{u}_0 = -(600\text{ m/s})\mathbf{i} + (750\text{ m/s})\mathbf{j} - (800\text{ m/s})\mathbf{k}$ into a stream of oxygen nuclei moving with a common velocity $\mathbf{v}_0 = (600\text{ m/s})\mathbf{j}$. After colliding successively with nuclei B and C, particle A is observed to move along the path defined by the Points $A_1(280, 240, 120)$and $A_2(360, 320, 160)$, while nuclei B and C are observed to move along paths defined, respectively, by $B_1(147, 220, 130)$, $B_2(114, 290, 120)$,and by $C_1(240, 232, 90)$ and $C_2(240, 280, 75)$. All paths are along straight lines and all coordinates are expressed in millimeters. Knowing that the mass of an oxygen nucleus is four times that of an alpha particle, determine the speed of each of the three particles after the collisions.

SOLUTION

Position vectors (mm): $\overrightarrow{A_1A_2} = 80\mathbf{i} + 80\mathbf{j} + 40\mathbf{k}$ $\quad (A_1A_2) = 120$

$\overrightarrow{B_1B_2} = -33\mathbf{i} + 70\mathbf{j} - 10\mathbf{k}$ $\quad (B_1B_2) = 78.032$

$\overrightarrow{C_1C_2} = 48\mathbf{j} - 15\mathbf{k}$ $\quad (C_1C_2) = 50.289$

Unit vectors: Along A_1A_2, $\quad \lambda_A = 0.66667\mathbf{i} + 0.66667\mathbf{j} + 0.33333\mathbf{k}$

Along B_1B_2, $\quad \lambda_B = -0.42290\mathbf{i} + 0.89707\mathbf{j} - 0.12815\mathbf{k}$

Along C_1C_2, $\quad \lambda_C = 0.95448\mathbf{j} - 0.29828\mathbf{k}$

Velocity vectors after the collisions:

$$\mathbf{v}_A = v_A\lambda_A$$
$$\mathbf{v}_B = v_B\lambda_B$$
$$\mathbf{v}_C = v_C\lambda_C$$

Conservation of momentum:

$$m\mathbf{u}_0 + 4m\mathbf{v}_0 + 4m\mathbf{v}_0 = m\mathbf{v}_A + 4m\mathbf{v}_B + 4m\mathbf{v}_C$$

Divide by m and substitute data.

$$(-600\mathbf{i} + 750\mathbf{j} - 800\mathbf{k}) + 2400\mathbf{j} + 2400\mathbf{j} = v_A\lambda_A + 4v_B\lambda_B + 4v_C\lambda_C$$

Resolving into components,

$$\mathbf{i}:\ -600 = 0.66667v_A - 1.69160v_B$$
$$\mathbf{j}:\ 5550 = 0.66667v_A + 3.58828v_B + 3.81792v_C$$
$$\mathbf{k}:\ -800 = 0.33333v_A - 0.51260v_B - 1.19312v_C$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.27

Derive the relation

$$\mathbf{H}_O = \bar{\mathbf{r}} \times m\bar{\mathbf{v}} + \mathbf{H}_G$$

between the angular momenta $\mathbf{H}_O$ and $\mathbf{H}_G$ defined in Eqs. (14.7) and (14.24), respectively. The vectors $\bar{\mathbf{r}}$ and $\bar{\mathbf{v}}$ define, respectively, the position and velocity of the mass center *G* of the system of particles relative to the newtonian frame of reference *Oxyz*, and *m* represents the total mass of the system.

SOLUTION

From Eq. (14.7),

$$\begin{aligned}
\mathbf{H}_O &= \sum_{i=1}^{n} (\mathbf{r}_i \times m_i \mathbf{v}_i) \\
&= \sum_{i=1}^{n} \left[(\bar{\mathbf{r}} + \mathbf{r}_i') \times m_i \mathbf{v}_i \right] \\
&= \bar{\mathbf{r}} \times \sum_{i=1}^{n} (m_i v_i) + \sum_{i=1}^{n} \left(r_i' \times m_i \mathbf{v}_i \right) \\
&= \bar{\mathbf{r}} \times m\bar{\mathbf{v}} + \mathbf{H}_G
\end{aligned}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.28

Show that Eq. (14.23) may be derived directly from Eq. (14.11) by substituting for $\mathbf{H}_O$ the expression given in Problem 14.27.

SOLUTION

From Eq. (14.7),

$$\mathbf{H}_O = \sum_{i=1}^{n}(\mathbf{r}_i \times m_i\mathbf{v}_i)$$

$$= \sum_{i=1}^{n}\left[(\overline{\mathbf{r}} + \mathbf{r}_i') \times m_i\mathbf{v}_i\right]$$

$$= \overline{\mathbf{r}} \times \sum_{i=1}^{n}(m_i v_i) + \sum_{i=1}^{n}\left(r_i' \times m_i\mathbf{v}_i\right)$$

$$= \overline{\mathbf{r}} \times m\overline{\mathbf{v}} + \mathbf{H}_G$$

Differentiating,

$$\dot{\mathbf{H}}_O = \dot{\overline{\mathbf{r}}} \times m\overline{\mathbf{v}} + \overline{\mathbf{r}} \times m\dot{\mathbf{v}} + \dot{\mathbf{H}}_G$$

Using Eq. (14.11),

$$\Sigma\mathbf{M}_O = \dot{\overline{\mathbf{r}}} \times m\overline{\mathbf{v}} + \overline{\mathbf{r}} \times m\dot{\mathbf{v}} + \dot{\mathbf{H}}_G$$

$$= \overline{\mathbf{v}} \times m\overline{\mathbf{v}} + \overline{\mathbf{r}} \times m\overline{\mathbf{a}} + \dot{\mathbf{H}}_G$$

$$= 0 + \overline{\mathbf{r}} \times \left(\sum_{i=1}^{n}\mathbf{F}_i\right) + \dot{\mathbf{H}}_G \qquad (1)$$

But

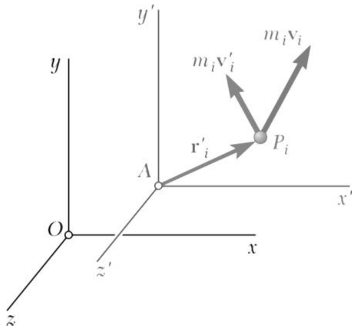
$$\sum_{i=1}^{n}\mathbf{M}_O = \sum_{i=1}^{n}\mathbf{M}_G + \sum_{i=1}^{n}\overline{\mathbf{r}} \times \left(\sum_{i=1}^{n}F_i\right)$$

Subtracting $\overline{\mathbf{r}} \times \left(\Sigma_{i=1}^{n}F_i\right)$ from each side of Eq. (1) gives

$$\Sigma\mathbf{M}_G = \dot{\mathbf{H}}_G$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.29



Consider the frame of reference $Ax'y'z'$ in translation with respect to the newtonian frame of reference $Oxyz$. We define the angular momentum $\mathbf{H}'_A$ of a system of n particles about A as the sum

$$\mathbf{H}'_A = \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}'_i \tag{1}$$

of the moments about A of the momenta $m_i\mathbf{v}'_i$ of the particles in their motion relative to the frame $Ax'y'z'$. Denoting by $\mathbf{H}_A$ the sum

$$\mathbf{H}_A = \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}_i \tag{2}$$

of the moments about A of the momenta $m_i\mathbf{v}_i$ of the particles in their motion relative to the newtonian frame $Oxyz$, show that $\mathbf{H}_A = \mathbf{H}'_A$ at a given instant if, and only if, one of the following conditions is satisfied at that instant: (*a*) A has zero velocity with respect to the frame $Oxyz$, (*b*) A coincides with the mass center G of the system, (*c*) the velocity $\mathbf{v}_A$ relative to $Oxyz$ is directed along the line AG.

SOLUTION

$$\mathbf{v}_i = \mathbf{v}_A + \mathbf{v}'_i$$

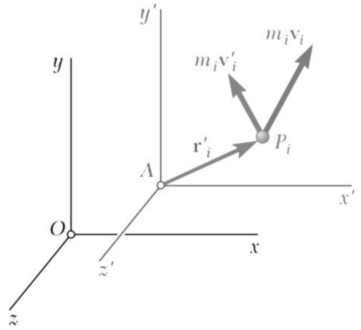
$$\begin{aligned}
\mathbf{H}_A &= \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}_i \\
&= \sum_{i=1}^{n} \mathbf{r}'_i \times m_i (\mathbf{v}_A + \mathbf{v}'_i) \\
&= \sum_{i=1}^{n} (\mathbf{r}'_i \times m_i \mathbf{v}_A) + \sum_{i=1}^{n} \mathbf{r}'_i \times m_i \mathbf{v}_i \\
&= \sum_{i=1}^{n} (m_i \mathbf{r}'_i) \times \mathbf{v}_A + \mathbf{H}'_A \\
&= \sum_{i=1}^{n} m_i (\mathbf{r}_i - \mathbf{r}_A) \times \mathbf{v}_A + \mathbf{H}'_A \\
&= m(\overline{\mathbf{r}} - \mathbf{r}_A) \times \mathbf{v}_A + \mathbf{H}'_A
\end{aligned}$$

$$\mathbf{H}_A = \mathbf{H}'_A \quad \text{if, and only if,} \qquad m(\mathbf{r} - \mathbf{r}_A) \times \mathbf{v}_A = 0$$

This condition is satisfied if

	(*a*)	$\mathbf{v}_A = 0$	Point A has zero velocity.
or	(*b*)	$\overline{\mathbf{r}} = \mathbf{r}_A$	Point A coincides with the mass center.
or	(*c*)	$\mathbf{v}_A$ is parallel to $\overline{\mathbf{r}} - \mathbf{r}_A$.	Velocity $\mathbf{v}_A$ is directed along line AG.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 14.30

Show that the relation $\Sigma\mathbf{M}_A = \dot{\mathbf{H}}'_A$, where $\mathbf{H}'_A$ is defined by Eq. (1) of Problem 14.29 and where $\Sigma\mathbf{M}_A$ represents the sum of the moments about A of the external forces acting on the system of particles, is valid if, and only if, one of the following conditions is satisfied: (*a*) the frame $Ax'y'z'$ is itself a newtonian frame of reference, (*b*) A coincides with the mass center G, (*c*) the acceleration $\mathbf{a}_A$ of A relative to $Oxyz$ is directed along the line AG.

SOLUTION

From equation (1),
$$\mathbf{H}'_A = \sum_{i=1}^{n}\left(\mathbf{r}'_i \times m_i\mathbf{v}'_i\right)$$
$$\mathbf{H}'_A = \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times m_i(\mathbf{v}_i - \mathbf{v}_A)]$$

Differentiate with respect to time.

$$\dot{\mathbf{H}}'_A = \sum_{i=1}^{n}[(\dot{\mathbf{r}}_i - \dot{\mathbf{r}}_A)\times m_i(\mathbf{v}_i - \mathbf{v}_A)] + \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times m_i(\dot{\mathbf{v}}_i - \dot{\mathbf{v}}_A)]$$

But
$$\dot{\mathbf{r}}_i = \mathbf{v}_i$$
$$\dot{\mathbf{v}}_i = \mathbf{a}_i$$
$$\dot{\mathbf{r}}_A = \mathbf{v}_A$$
and
$$\dot{\mathbf{v}}_A = \mathbf{a}_A$$

Hence,
$$\dot{\mathbf{H}}'_A = 0 + \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times m_i(\mathbf{a}_i - \mathbf{a}_A)]$$
$$= \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times(\mathbf{F}_i - m_i\mathbf{a}_A)]$$
$$= \sum_{i=1}^{n}[(\mathbf{r}_i - \mathbf{r}_A)\times\mathbf{F}_i] - \sum_{i=1}^{n}[m_i(\mathbf{r}_i - \mathbf{r}_A)]\times\mathbf{a}_A$$
$$= \mathbf{M}_A - m(\overline{\mathbf{r}} - r_A)\times\mathbf{a}_A$$
$$\dot{\mathbf{H}}'_A = M_A \quad \text{if, and only if,} \quad m(\overline{\mathbf{r}} - \mathbf{r}_A)\times\mathbf{a}_A = 0$$

This condition is satisfied if

	(*a*)	$\mathbf{a}_A = 0$	The frame is newtonian.
or	(*b*)	$\overline{\mathbf{r}} = \mathbf{r}_A$	Point A coincides with the mass center.
or	(*c*)	$\mathbf{a}_A$ is parallel to $\overline{\mathbf{r}} - \mathbf{r}_A$.	Acceleration $\mathbf{a}_A$ is directed along line AG.

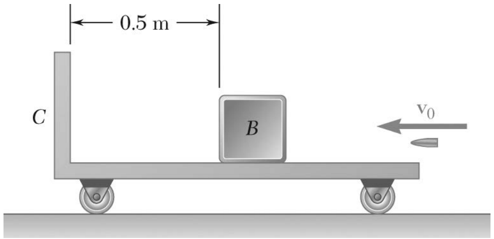
PROBLEM 14.31



Determine the energy lost due to friction and the impacts for Problem 14.1.

PROBLEM 14.1 A 30-g bullet is fired with a horizontal velocity of 450 m/s and becomes embedded in block *B* which has a mass of 3 kg. After the impact, block *B* slides on 30-kg carrier *C* until it impacts the end of the carrier. Knowing the impact between *B* and *C* is perfectly plastic and the coefficient of kinetic friction between *B* and *C* is 0.2, determine (*a*) the velocity of the bullet and *B* after the first impact, (*b*) the final velocity of the carrier.

SOLUTION

From the solution to Problem 4.1 the velocity of *A* and *B* after the first impact is $v' = 4.4554$ m/s and the velocity common to *A*, *B*, and *C* after the sliding of block *B* and bullet *A* relative to the carrier *C* has ceased in $v'' = 0.4087$ m/s.

Friction loss due to sliding:

Normal force: $N = W_A + W_B = (m_A + m_B)\,g$

$= (0.030 \text{ kg} + 3 \text{ kg})(9.81 \text{ m/s}) = 29.724 \text{ N}$

Friction force: $F_f = \mu_k N = (0.2)(29.724) = 5.945 \text{ N}$

Relative sliding distance: Assume $d = 0.5$ m.

Energy loss due to friction: $F_f d = (5.945)(0.5)$ $\quad F_f d = 2.97 \text{ J}$ ◀

Kinetic energy of block with embedded bullet immediately after first impact:

$$T'_{AB} = \frac{1}{2}(m_A + m_B)(v')^2 = \frac{1}{2}(3.03 \text{ kg})(4.4554 \text{ m/s})^2 = 30.07 \text{ J}$$

Final kinetic energy of *A*, *B*, and *C* together

$$T''_{ABC} = \frac{1}{2}(m_A + m_B + m_C)(v'')^2 = \frac{1}{2}(33.03 \text{ kg})(0.4087 \text{ m/s})^2 = 2.76 \text{ J}$$

Loss due to friction and stopping impact: $T'_{AB} - T''_{ABC} = 30.07 - 2.76 = 27.31 \text{ J}$

Since $27.31 \text{ J} \geq 2.97 \text{ J},$ the block slides 0.5 m relative to the carrier as assumed above.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.31 (Continued)

Impact loss due to AB impacting the carrier:

$$27.31 - 2.97 = 24.34 \qquad \text{Loss} = 24.3 \text{ J} \blacktriangleleft$$

Initial kinetic energy of system ABC.

$$T_0 = \frac{1}{2} m_A v_0^2 = \frac{1}{2}(0.030 \text{ kg})(450 \text{ m/s})^2 = 3037.5 \text{ J}$$

Impact loss at first impact:

$$T_0 - T'_{AB} = 3037.5 - 30.07 \qquad \text{Loss} = 3007 \text{ J} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.32

In Problem 14.4, determine the energy lost as the bullet (*a*) passes through block *A*, (*b*) becomes embedded in block *B*.

SOLUTION

The masses are *m* for the bullet and m_A and m_B for the blocks.

The bullet passes through block *A* and embeds in block *B*. Momentum is conserved.

Initial momentum: $mv_0 + m_A(0) + m_B(0) = mv_0$

Final momentum: $mv_B + m_A v_A + m_B v_B$

Equating, $mv_0 = mv_B + m_A v_A + m_B v_B$

$$m = \frac{m_A v_A + m_B v_B}{v_0 - v_B} = \frac{(6)(5) + (4.95)(9)}{1500 - 9} = 0.0500 \text{ lb}$$

The bullet passes through block *A*. Momentum is conserved.

Initial momentum: $mv_0 + m_A(0) = mv_0$

Final momentum: $mv_1 + m_A v_A$

Equating, $mv_0 = mv_1 + m_A v_A$

$$v_1 = \frac{mv_0 - m_A v_A}{m} = \frac{(0.0500)(1500) - (6)(5)}{0.0500} = 900 \text{ ft/s}$$

The masses are: $$m = \frac{0.05}{32.2} = 1.5528 \times 10^{-3} \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_A = \frac{6}{32.2} = 0.18633 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$m_B = \frac{4.95}{32.2} = 0.153727 \text{ lb} \cdot \text{s}^2/\text{ft}$$

(*a*) Bullet passes through block *A*. Kinetic energies:

Before: $$T_0 = \frac{1}{2}mv_0^2 = \frac{1}{2}(1.5528 \times 10^{-3})(1500)^2 = 1746.9 \text{ ft} \cdot \text{lb}$$

After: $$T_1 = \frac{1}{2}mv_1^2 + \frac{1}{2}m_A v_A^2 = \frac{1}{2}(1.5528 \times 10^{-3})(900)^2 + \frac{1}{2}(0.18633)(5)^2 = 631.2 \text{ ft} \cdot \text{lb}$$

Lost: $T_0 - T_1 = 1746.9 - 631.2 = 1115.7 \text{ ft} \cdot \text{lb}$ energy lost $= 1116 \text{ ft} \cdot \text{lb}$ ◀

(*b*) Bullet becomes embedded in block *B*. Kinetic energies:

Before: $$T_2 = \frac{1}{2}mv_1^2 = \frac{1}{2}(1.5528 \times 10^{-3})(900)^2 = 628.9 \text{ ft} \cdot \text{lb}$$

After: $$T_3 = \frac{1}{2}(m + m_B)v_B^2 = \frac{1}{2}(0.15528)(9)^2 = 6.29 \text{ ft} \cdot \text{lb}$$

Lost: $T_2 - T_3 = 628.9 - 6.29 = 622.6 \text{ ft} \cdot \text{lb}$ energy lost $= 623 \text{ ft} \cdot \text{lb}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.33

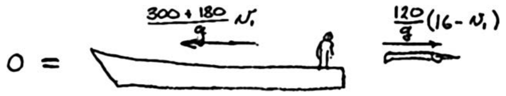
In Problem 14.6, determine the work done by the woman and by the man as each dives from the boat, assuming that the woman dives first.

SOLUTION

Woman dives first.

Conservation of momentum:



$$\frac{120}{g}(16 - v_1) - \frac{300+180}{g}v_1 = 0$$

$$v_1 = \frac{(120)(16)}{600} = 3.20 \text{ ft/s} \longleftarrow$$

$$16 - v_1 = 12.80 \text{ ft/s} \longrightarrow$$

Kinetic energy before dive: $T_0 = 0$

Kinetic energy after dive:

$$T_1 = \frac{1}{2}\frac{300+180}{32.2}(3.20)^2 + \frac{1}{2}\frac{120}{32.2}(12.80)^2$$
$$= 381.61 \text{ ft}\cdot\text{lb}$$

Work of woman: $T_1 - T_0 = 381.61 \text{ ft}\cdot\text{lb}$ $\qquad T_1 - T_0 = 382 \text{ ft}\cdot\text{lb}$ ◀

Man dives next. Conservation of momentum:

$$-\frac{300+180}{g}v_1 = -\frac{300}{g}v_2 + \frac{180}{g}(16 - v_2)$$

$$v_2 = \frac{480v_1 + (180)(16)}{480} = 9.20 \text{ ft/s} \longleftarrow$$

$$16 - 9.20 = 6.80 \text{ ft/s} \longrightarrow$$

PROBLEM 14.34

Determine the energy lost as a result of the series of collisions described in Problem 14.8.

PROBLEM 14.8 Packages in an automobile parts supply house are transported to the loading dock by pushing them along on a roller track with very little friction. At the instant shown, packages *B* and *C* are at rest and package *A* has a velocity of 2 m/s. Knowing that the coefficient of restitution between the packages is 0.3, determine (*a*) the velocity of package *C* after *A* hits *B* and *B* hits *C*, (*b*) the velocity of *A* after it hits *B* for the second time.

SOLUTION

From the solution to Problem 14.8

$$v_A = 2 \text{ m/s}, \quad v_B = v_C = 0,$$
$$v'_A = 1.133 \text{ m/s}, \quad v'_B = 1.733 \text{ m/s}, \quad v''_B = 0.382 \text{ m/s}$$
$$v'_B = 0.901 \text{ m/s} \quad v''_A = 0.807 \text{ m/s}, \quad v''_B = 1.033 \text{ m/s}$$
$$m_A = 8 \text{ kg}, \qquad m_B = 4 \text{ kg}, \qquad m_C = 6 \text{ kg}$$

A hits *B*:

$$T_1 = \frac{1}{2}m_A v_A^2 = \frac{1}{2}(8 \text{ kg})(2 \text{ m/s})^2 = 16 \text{ J}$$
$$T_2 = \frac{1}{2}m_A(v'_A)^2 + \frac{1}{2}m_B(v'_B)^2$$
$$T = \frac{1}{2}(8 \text{ kg})(1.133 \text{ m/s})^2 + \frac{1}{2}(4 \text{ kg})(1.733 \text{ m/s})^2 = 11.14 \text{ J}$$

Loss $= T_1 - T_2$: Loss $= 4.86$ J ◀

B hits *C*:

$$T_3 = \frac{1}{2}m_B(v'_B)^2 = \frac{1}{2}(4 \text{ kg})(1.733)^2 = 6.007 \text{ J}$$
$$T_4 = \frac{1}{2}m_B(v''_B)^2 + \frac{1}{2}m_C(v'_C)^2$$
$$= \frac{1}{2}(4 \text{ kg})(0.382 \text{ m/s})^2 + \frac{1}{2}(6 \text{ kg})(0.901 \text{ m/s})^2 = 2.727 \text{ J}$$

Loss $= T_3 - T_4$: Loss $= 3.28$ J ◀

A hits *B* again:

$$T_5 = \frac{1}{2}m_A(v'_A)^2 + \frac{1}{2}m_B(v''_B)^2$$
$$= \frac{1}{2}(8 \text{ kg})(1.33 \text{ m/s})^2 + \frac{1}{2}(4 \text{ kg})(0.382)^2 = 5.427 \text{ J}$$
$$T_6 = \frac{1}{2}m_A(v''_A)^2 + \frac{1}{2}m_B(v'''_B)^2$$
$$= \frac{1}{2}(8 \text{ kg})(0.807 \text{ m/s})^2 + \frac{1}{2}(4 \text{ kg})(1.033 \text{ m/s})^2 = 4.739 \text{ J}$$

Loss $= T_5 - T_6$: Loss $= 0.688$ J

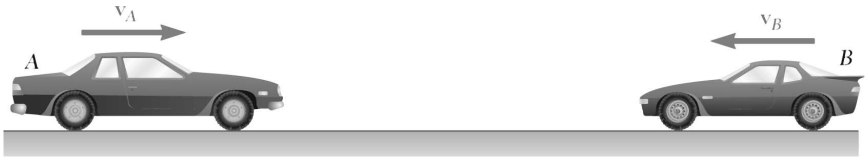
PROBLEM 14.35

Two automobiles A and B, of mass m_A and m_B, respectively, are traveling in opposite directions when they collide head on. The impact is assumed perfectly plastic, and it is further assumed that the energy absorbed by each automobile is equal to its loss of kinetic energy with respect to a moving frame of reference attached to the mass center of the two-vehicle system. Denoting by E_A and E_B, respectively, the energy absorbed by automobile A and by automobile B, (a) show that $E_A/E_B = m_B/m_A$, that is, the amount of energy absorbed by each vehicle is inversely proportional to its mass, (b) compute E_A and E_B, knowing that $m_A = 1600$ kg and $m_B = 900$ kg and that the speeds of A and B are, respectively, 90 km/h and 60 km/h.



SOLUTION

Velocity of mass center:
$$(m_A + m_B)\bar{\mathbf{v}} = m_A\mathbf{v}_A + m_B\mathbf{v}_B$$
$$\bar{\mathbf{v}} = \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B}$$

Velocities relative to the mass center:
$$\mathbf{v}'_A = \mathbf{v}_A - \bar{\mathbf{v}} = \mathbf{v}_A - \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B} = \frac{m_B(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$
$$\mathbf{v}'_B = \mathbf{v}_B - \bar{\mathbf{v}} = \mathbf{v}_B - \frac{m_A\mathbf{v}_A + m_B\mathbf{v}_B}{m_A + m_B} = \frac{m_A(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

Energies:
$$E_A = \frac{1}{2}m_A\mathbf{v}'_A \cdot \mathbf{v}'_A = \frac{m_A m_B^2(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$
$$E_B = \frac{1}{2}m_B\mathbf{v}'_B \cdot \mathbf{v}'_B = \frac{m_A^2 m_B(\mathbf{v}_A + \mathbf{v}_B)\cdot(\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

(a) Ratio:
$$\frac{E_A}{E_B} = \frac{m_B}{m_A} \blacktriangleleft$$

(b)
$$\mathbf{v}_A = 90 \text{ km/h} = 25 \text{ m/s} \longrightarrow$$
$$\mathbf{v}_B = 60 \text{ km/h} = 16.667 \text{ m/s} \longleftarrow$$
$$\mathbf{v}_A + \mathbf{v}_B = 41.667 \text{ m/s} \longrightarrow$$
$$E_A = \frac{(1600)(900)^2(41.667)^2}{(2)(2500)^2} = 180.0\times10^3 \text{ J} \qquad E_A = 180.0 \text{ kJ} \blacktriangleleft$$
$$E_B = \frac{(1600)^2(900)(41.667)^2}{(2)(2500)^2} = 320\times10^3 \text{ J} \qquad E_B = 320 \text{ kJ} \blacktriangleleft$$

PROBLEM 14.36

It is assumed that each of the two automobiles involved in the collision described in Problem 14.35 had been designed to safely withstand a test in which it crashed into a solid, immovable wall at the speed v_0. The severity of the collision of Problem 14.35 may then be measured for each vehicle by the ratio of the energy it absorbed in the collision to the energy it absorbed in the test. On that basis, show that the collision described in Problem 14.35 is $(m_A/m_B)^2$ times more severe for automobile B than for automobile A.

SOLUTION

Velocity of mass center: $(m_A + m_B)\overline{\mathbf{v}} = m_A \mathbf{v}_A + m_B \mathbf{v}_B$

$$\overline{\mathbf{v}} = \frac{m_A \mathbf{v}_A + m_B \mathbf{v}_B}{m_A + m_B}$$

Velocities relative to the mass center:

$$\mathbf{v}'_A = \mathbf{v}_A - \overline{\mathbf{v}} = \mathbf{v}_A - \frac{m_A \mathbf{v}_A + m_B \mathbf{v}_B}{m_A + m_B} = \frac{m_B(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

$$\mathbf{v}'_B = \mathbf{v}_B - \overline{\mathbf{v}} = \mathbf{v}_B - \frac{m_A \mathbf{v}_A + m_B \mathbf{v}_B}{m_A + m_B} = \frac{m_A(\mathbf{v}_A + \mathbf{v}_B)}{m_A + m_B}$$

Energies:

$$E_A = \frac{1}{2} m_A \mathbf{v}'_A \cdot \mathbf{v}'_A = \frac{m_A m_B^2 (\mathbf{v}_A + \mathbf{v}_B) \cdot (\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

$$E_B = \frac{1}{2} m_B \mathbf{v}'_B \cdot \mathbf{v}'_B = \frac{m_A^2 m_B (\mathbf{v}_A + \mathbf{v}_B) \cdot (\mathbf{v}_A + \mathbf{v}_B)}{2(m_A + m_B)^2}$$

Energies from tests: $(E_A)_0 = \frac{1}{2} m_A v_0^2, \quad (E_B)_0 = \frac{1}{2} m_B v_0^2$

Severities:

$$S_A = \frac{E_A}{(E_A)_0} = \frac{m_B^2 (\mathbf{v}_A + \mathbf{v}_B) \cdot (\mathbf{v}_A + \mathbf{v}_B)}{(m_A + m_B)^2 v_0^2}$$

$$S_B = \frac{E_B}{(E_B)_0} = \frac{m_A^2 (\mathbf{v}_A + \mathbf{v}_B) \cdot (\mathbf{v}_A + \mathbf{v}_B)}{(m_A + m_B)^2 v_0^2}$$

Ratio:

$$\frac{S_A}{S_B} = \frac{m_B^2}{m_A^2} \quad \blacktriangleleft$$

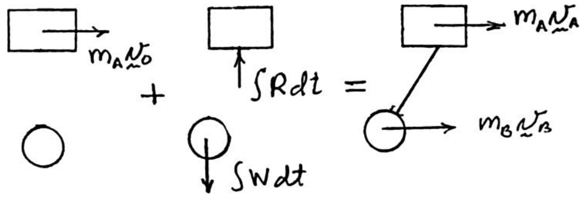
PROBLEM 14.37

Solve Sample Problem 14.4, assuming that cart A is given an initial horizontal velocity $\mathbf{v}_0$ while ball B is at rest.

SOLUTION

(a) Velocity of B at maximum elevation: At maximum elevation, ball B is at rest relative to cart A. $\mathbf{v}_B = \mathbf{v}_A$

Use impulse-momentum principle.



x components:

$$m_A v_0 + 0 = m_A v_A + m_B v_B$$
$$= (m_A + m_B) v_B$$

$$v_B = \frac{m_A v_0}{m_A + m_B} \longrightarrow \blacktriangleleft$$

(b) Conservation of energy:

$$T_1 = \frac{1}{2} m_A v_0^2, \quad V_1 = 0$$

$$T_2 = \frac{1}{2} m_A v_A^2 + \frac{1}{2} m_B v_B^2$$
$$= \frac{1}{2}(m_A + m_B) v_B^2$$
$$= \frac{m_A^2 v_0^2}{2(m_A + m_B)}$$

$$V_2 = m_B g h$$

$$T_2 + V_2 = T_1 + V_1$$

$$\frac{m_A^2 v_0^2}{2(m_A + m_B)} + m_B g h = \frac{1}{2} m_A v_0^2$$

$$h = \frac{1}{2 m_B g}\left[m_A v_0^2 - \frac{m_A^2 v_0^2}{m_A + m_B} \right] \qquad h = \frac{m_A}{m_A + m_B} \frac{v_0^2}{2g} \blacktriangleleft$$

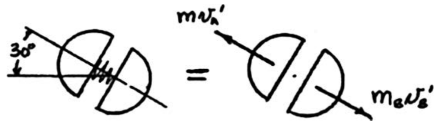
PROBLEM 14.38

Two hemispheres are held together by a cord which maintains a spring under compression (the spring is not attached to the hemispheres). The potential energy of the compressed spring is 120 J and the assembly has an initial velocity $\mathbf{v}_0$ of magnitude $v_0 = 8$ m/s. Knowing that the cord is severed when $\theta = 30°$, causing the hemispheres to fly apart, determine the resulting velocity of each hemisphere.

SOLUTION

Use a frame of reference moving with the mass center.



Conservation of momentum:

$$0 = -m_A v_A' + m_B v_B'$$

$$v_A' = \frac{m_B}{m_A} v_B'$$

Conservation of energy:

$$V = \frac{1}{2} m_A (v_A')^2 + \frac{1}{2} m_B (v_B')^2$$

$$= \frac{1}{2} m_A \left(\frac{m_B}{m_A} v_B' \right)^2 + \frac{1}{2} m_B (v_B')^2$$

$$= \frac{m_B (m_A + m_B)}{2 m_A} (v_B')^2$$

$$v_B' = \sqrt{\frac{2 m_A V}{m_B (m_A + m_B)}}$$

Data: $m_A = 2.5 \text{ kg} \quad m_B = 1.5 \text{ kg}$

$$V = 120 \text{ J}$$

$$v_B' = \sqrt{\frac{(2)(2.5)(120)}{(1.5)(4.0)}} = 10 \qquad v_B' = 10 \text{ m/s} \searrow 30°$$

$$v_A' = \frac{1.5}{2.5}(10) = 6 \qquad v_A' = 6 \text{ m/s} \nwarrow 30°$$

Velocities of A and B.

$$\mathbf{v}_A = [8 \text{ m/s} \longrightarrow] + [6 \text{ m/s} \nwarrow 30°] \qquad \mathbf{v}_A = 4.11 \text{ m/s} \nearrow 46.9° \blacktriangleleft$$

$$\mathbf{v}_B = [8 \text{ m/s} \longrightarrow] + [10 \text{ m/s} \searrow 30°] \qquad \mathbf{v}_B = 17.39 \text{ m/s} \searrow 16.7° \blacktriangleleft$$

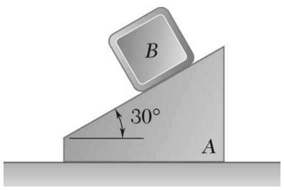
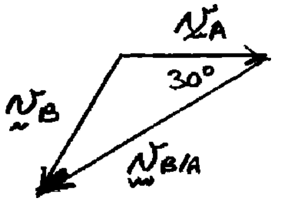
PROBLEM 14.39



A 15-lb block B starts from rest and slides on the 25-lb wedge A, which is supported by a horizontal surface. Neglecting friction, determine (*a*) the velocity of B relative to A after it has slid 3 ft down the inclined surface of the wedge, (*b*) the corresponding velocity of A.

SOLUTION

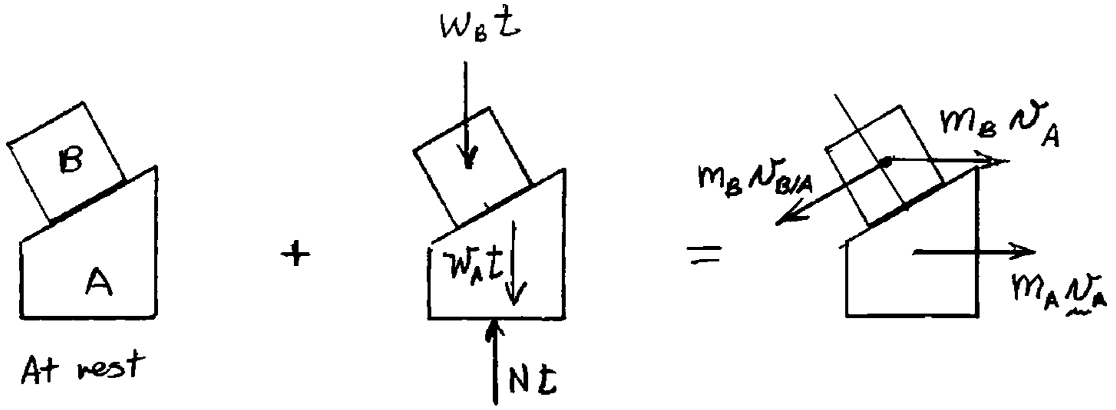
Kinematics: $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$



Law of cosines: $v_B^2 = v_A^2 + v_{B/A}^2 - 2v_A v_{B/A}\cos 30°$ (1)

Principle of impulse and momentum:

$$\Sigma m\mathbf{v}_0 + \Sigma \mathbf{F}t = \Sigma m\mathbf{v}$$



Components $\longrightarrow$: $0 + 0 = m_A v_A + m_B(v_A - v_{B/A}\cos 30°)$

$$v_A = \frac{m_B v_{B/A}\cos 30°}{m_A + m_B} = \frac{15\cos 30°}{25+15}v_{B/A}$$
$$= 0.32476\, v_{B/A}$$

From Eq. (1) $v_B^2 = (0.32476)^2 v_{B/A}^2 + v_{B/A}^2 - (2)(0.32476)\cos 30° v_{B/A}^2$

$$= 0.54297\ v_{B/A}^2$$

Principle of conservation of energy: $T_0 + V_0 = T_1 + V_1$

$$0 + 0 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 - W_B d\sin 30°$$

$$\frac{1}{2}\frac{W_A}{g}(0.32476 v_{B/A})^2 + \frac{1}{2}\frac{W_B}{g}(0.54297)\, v_{B/A}^2 = W_B d\sin 30°$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.39 (Continued)

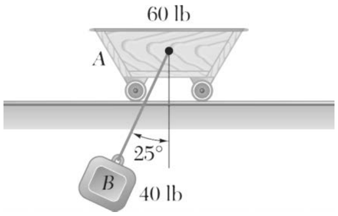
$$\left[\frac{1}{2}\frac{25}{32.2}(0.32476)^2+\frac{1}{2}\frac{15}{32.2}(0.54297)\right]v_{B/A}^2=(15)(3)\sin 30°$$

$$0.16741v_{B/A}^2=22.5$$

(*a*) $\mathbf{v}_{B/A}=11.59\text{ ft/s}\ \measuredangle\ 30°$ ◀

(b) $v_A=(0.32476)(11.59)$ $\mathbf{v}_A=3.76\text{ ft/s}\longrightarrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

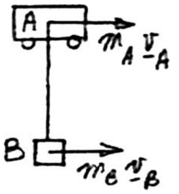


PROBLEM 14.40

A 40-lb block *B* is suspended from a 6-ft cord attached to a 60-lb cart *A*, which may roll freely on a frictionless, horizontal track. If the system is released from rest in the position shown, determine the velocities of *A* and *B* as *B* passes directly under *A*.

SOLUTION

Conservation of linear momentum:



Since block and cart are initially at rest,

$$\mathbf{L}_0 = 0$$

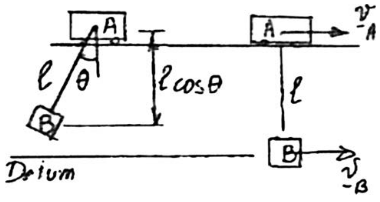
Thus, as *B* passes under *A*,

$$\mathbf{L} = m_A\mathbf{v}_A + m_B\mathbf{v}_B = 0$$

$$\xrightarrow{+} m_A v_A + m_B v_B = 0$$

$$v_A = -\frac{m_B}{m_A} v_B \qquad (1)$$

Conservation of energy:



Initially,

$$T_0 = 0$$
$$V_0 = m_B g l(1-\cos\theta)$$

As *B* passes under *A*,

$$T = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2$$
$$V = 0$$

Thus,

$$T_0 + V_0 = T + V: \quad m_B g l(1-\cos\theta) = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2$$

Substituting for v_A from (1) and multiplying by 2:

$$2m_B g l(1-\cos\theta) = m_A\left(\frac{m_B^2}{m_A^2}v_B^2\right) + m_B v_B^2$$

$$= \left(\frac{m_B^2}{m_A} + m_B\right)v_B^2 = m_B\frac{m_B + m_A}{m_A}v_B^2$$

$$v_B = \sqrt{\frac{2m_A}{m_A + m_B}gl(1-\cos\theta)} \qquad (2)$$

PROBLEM 14.40 (Continued)

Given data: $w_A = 60 \text{ lb} \quad w_B = 40 \text{ lb}, \quad l = 6 \text{ ft}$

$$g = 32.2 \text{ ft/s}^2 \quad \theta = 25°$$

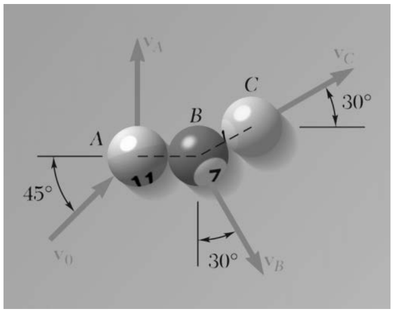
$$\frac{2m_A}{m_A + m_B} = \frac{2w_A}{w_A + w_B} = \frac{(2)(60)}{60 + 40} = 1.2$$

From Eq. (2), $v_B = \sqrt{(1.2)(32.2)(6)(1 - \cos 25°)}$ $\quad \mathbf{v}_B = 4.66 \text{ ft/s} \longrightarrow$ ◀

From Eq. (1), $v_A = -\frac{w_B}{w_A} v_B = -\frac{40}{60}(4.66)$ $\quad \mathbf{v}_A = 3.11 \text{ ft/s} \longleftarrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.41



In a game of pool, ball A is moving with a velocity $\mathbf{v}_0$ of magnitude $v_0 = 15$ ft/s when it strikes balls B and C, which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated and assuming frictionless surfaces and perfectly elastic impact (i.e., conservation of energy), determine the magnitudes of the velocities $\mathbf{v}_A$, $\mathbf{v}_B$, and $\mathbf{v}_C$.

SOLUTION

Velocity vectors: $\quad \mathbf{v}_0 = v_0(\cos 45°\,\mathbf{i} + \sin 45°\,\mathbf{j}) \qquad v_0 = 15 \text{ ft/s}$

$$\mathbf{v}_A = v_A\mathbf{j}$$
$$\mathbf{v}_B = v_B(\sin 30°\,\mathbf{i} - \cos 30°\,\mathbf{j})$$
$$\mathbf{v}_C = v_C(\cos 30°\,\mathbf{i} + \sin 30°\,\mathbf{j})$$

Conservation of momentum:

$$m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$$

Divide by m and resolve into components.

$$\mathbf{i}:\quad v_0 \cos 45° = v_B \sin 30° + v_C \cos 30°$$

$$\mathbf{j}:\quad v_0 \sin 45° = v_A - v_B \cos 30° + v_C \sin 30°$$

Solving for v_B and v_C,

$$v_B = -0.25882 v_0 + 0.86603 v_A$$
$$v_C = 0.96593 v_0 - 0.5 v_A$$

Conservation of energy: $\quad \frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$

Divide by $\frac{1}{2}m$ and substitute for v_B and v_C.

$$v_0^2 = v_A^2 + (-0.25882 v_0 + 0.86603 v_A)^2 + (0.96593 v_0 - 0.5 v_A)^2$$
$$= 2v_A^2 + v_0^2 - 1.41422 v_0 v_A$$

$v_A = 0.70711 v_0 = 10.61$ ft/s $\qquad v_A = 10.61$ ft/s ◀

$v_B = 0.35355 v_0 = 5.30$ ft/s $\qquad v_B = 5.30$ ft/s ◀

$v_C = 0.61237 v_0 = 9.19$ ft/s $\qquad v_C = 9.19$ ft/s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. 	## PROBLEM 14.42

In a game of pool, ball A is moving with a velocity $\mathbf{v}_0$ of magnitude $v_0 = 15$ ft/s when it strikes balls B and C, which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated and assuming frictionless surfaces and perfectly elastic impact (i.e., conservation of energy), determine the magnitudes of the velocities $\mathbf{v}_A$, $\mathbf{v}_B$, and $\mathbf{v}_C$.

SOLUTION

Velocity vectors: $\mathbf{v}_0 = v_0(\cos 30°\mathbf{i} + \sin 30°\mathbf{j}) \qquad v_0 = 15$ ft/s

$$\mathbf{v}_A = v_A\mathbf{j}$$

$$\mathbf{v}_B = v_B(\sin 45°\mathbf{i} - \cos 45°\mathbf{j})$$

$$\mathbf{v}_C = v_C(\cos 45°\mathbf{i} + \sin 45°\mathbf{j})$$

Conservation of momentum:

$$m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$$

Divide by m and resolve into components.

$$\mathbf{i}: \quad v_0\cos 30° = v_B\sin 45° + v_C\cos 45°$$

$$\mathbf{j}: \quad v_0\sin 30° = v_A - v_B\cos 45° + v_C\sin 45°$$

Solving for v_B and v_C,

$$v_B = 0.25882v_0 + 0.70711v_A$$

$$v_C = 0.96593v_0 - 0.70711v_A$$

Conservation of energy: $\frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$

Divide by m and substitute for v_B and v_C.

$$v_0^2 = v_A^2 + (0.25882v_0 + 0.70711v_A)^2 + (0.96593v_0 - 0.70711v_A)^2$$

$$= v_0^2 - v_0v_A + 2v_A^2$$

$v_A = 0.5v_0 = 7.500$ ft/s $\qquad v_A = 7.50$ ft/s ◀

$v_B = 0.61237v_0 = 9.1856$ ft/s $\qquad v_B = 9.19$ ft/s ◀

$v_C = 0.61237v_0 = 9.1856$ ft/s $\qquad v_C = 9.19$ ft/s ◀

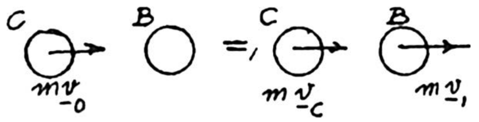
PROBLEM 14.43

Three spheres, each of mass m, can slide freely on a frictionless, horizontal surface. Spheres A and B are attached to an inextensible, inelastic cord of length l and are at rest in the position shown when sphere B is struck squarely by sphere C, which is moving to the right with a velocity $\mathbf{v}_0$. Knowing that the cord is slack when sphere B is struck by sphere C and assuming perfectly elastic impact between B and C, determine (a) the velocity of each sphere immediately after the cord becomes taut, (b) the fraction of the initial kinetic energy of the system which is dissipated when the cord becomes taut.

SOLUTION

(a) Determination of velocities.

Impact of C and B.



Conservation of momentum:

$$m\mathbf{v}_0 = m\mathbf{v}_C + m\mathbf{v}_1$$

$$v_C + v_1 = v_0 \tag{1}$$

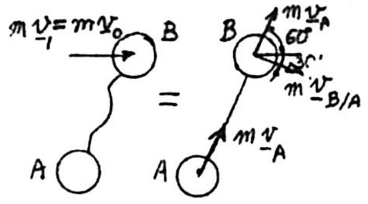
Conservation of energy (perfectly elastic impact):

$$\frac{1}{2}mv_0^2 = \frac{1}{2}mv_C^2 + \frac{1}{2}mv_1^2 \qquad v_C^2 + v_1^2 = v_0^2 \tag{2}$$

Square Eq. (1): $\quad v_C^2 + 2v_Cv_1 + v_1^2 = v_0^2$

Subtract Eq. (2): $\quad 2v_Cv_1 = 0$

$v_1 = 0$ corresponds to initial conditions and should be eliminated. Therefore, $\quad \mathbf{v}_C = 0$ ◀



From Eq. (1): $\quad v_1 = v_0$

Cord AB becomes taut:

Because cord is inextensible, component of $\mathbf{v}_B$ along AB must be equal to $\mathbf{v}_A$.

Conservation of momentum:

$$m\mathbf{v}_0 = 2m\mathbf{v}_A + m\mathbf{v}_{B/A}$$

$+\uparrow$ y comp: $\quad 0 = 2mv_A \sin 60° - mv_{B/A} \sin 30°$

$$v_{B/A} = 2\sqrt{3}v_A \tag{3}$$

$\xrightarrow{+}$ x comp: $\quad mv_0 = 2mv_A \cos 60° + mv_{B/A} \cos 30°$

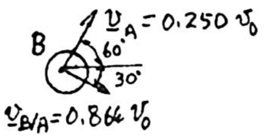
PROBLEM 14.43 (Continued)

Dividing by m and substituting for $v_{B/A}$ from Eq. (3):

$$v_0 = 2v_A\,(0.5) + (2\sqrt{3}v_A\,)(\sqrt{3/2})$$

$$v_0 = 4v_A \qquad v_A = 0.250v_0 \qquad\qquad \mathbf{v}_A = 0.250v_0 \measuredangle 60^\circ \blacktriangleleft$$

Carrying into Eq. (3): $\quad v_{B/A} = 2\sqrt{3}(0.250v_0) = 0.866v_0$



Thus, $\quad \mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

$$= 0.250v_0 \measuredangle 60^\circ + 0.866v_0 \searrow 30^\circ$$

$$\mathbf{v}_B = (0.250v_0\cos 60^\circ + 0.866v_0\cos 30^\circ)\mathbf{i} + (0.250v_0\sin 60^\circ - 0.866v_0\sin 30^\circ)\mathbf{j}$$

$$\mathbf{v}_B = 0.875v_0\mathbf{i} - 0.2165\mathbf{j}$$

$$\mathbf{v}_B = 0.90139v_0 \searrow 13.90^\circ \qquad\qquad \mathbf{v}_B = 0.901v_0 \searrow 13.9^\circ \blacktriangleleft$$

(*b*) Fraction of kinetic energy lost:

$$T_0 = \frac{1}{2}mv_0^2$$

$$T_{\text{final}} = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$$

$$= \frac{1}{2}m(0.250v_0)^2 + \frac{1}{2}(0.90139v_0)^2 + \frac{1}{2}m(0)$$

$$= \frac{1}{2}m(0.875)v_0^2$$

$$\text{Kinetic energy lost} = T_0 - T_{\text{final}} = \frac{1}{2}m(1-0.875)v_0^2 = \frac{1}{2}\cdot\frac{1}{8}mv_0^2$$

$$\text{Fraction of kinetic energy lost} = \frac{1}{8} \blacktriangleleft$$

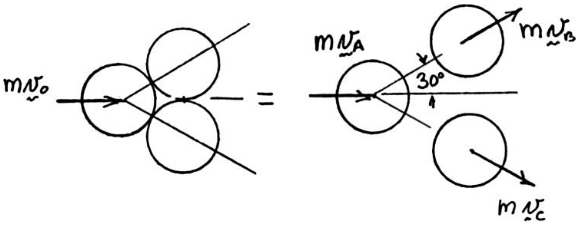
PROBLEM 14.44

In a game of pool, ball A is moving with the velocity $\mathbf{v}_0 = v_0\mathbf{i}$ when it strikes balls B and C, which are at rest side by side. Assuming frictionless surfaces and perfectly elastic impact (i.e., conservation of energy), determine the final velocity of each ball, assuming that the path of A is (*a*) perfectly centered and that A strikes B and C simultaneously, (*b*) not perfectly centered and that A strikes B slightly before it strikes C.

SOLUTION

(*a*) A strikes B and C simultaneously:

During the impact, the contact impulses make $30°$ angles with the velocity $\mathbf{v}_0$.



Thus, $\mathbf{v}_B = v_B(\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$

$\mathbf{v}_C = v_C(\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$

By symmetry, $\mathbf{v}_A = v_A\mathbf{i}$

Conservation of momentum: $m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$

y component: $0 = 0 + mv_B \sin 30° - mv_C \sin 30° \qquad v_C = v_B$

x component: $mv_0 = mv_A + mv_B \cos 30° + mv_C \cos 30°$

$$v_B + v_C = \frac{v_0 - v_A}{\cos 30°} = \frac{2}{\sqrt{3}}(v_0 - v_A)$$

$$v_B = v_C = \frac{v_0 - v_A}{\sqrt{3}}$$

Conservation of energy: $\frac{1}{2}mv_0^2 = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$

$$v_0^2 = v_A^2 + \frac{2}{3}(v_0 - v_A)^2$$

$$v_0^2 - v_A^2 = (v_0 - v_A)(v_0 + v_A) = \frac{2}{3}(v_0 - v_A)^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$v_0 + v_A = \frac{2}{3}(v_0 - v_A) \qquad \frac{1}{3}v_0 = -\frac{5}{3}v_A \qquad v_A = -\frac{1}{5}v_0$$

$$v_B = v_C = \frac{6}{5\sqrt{3}}v_0 = \frac{2\sqrt{3}}{5}v_0$$

$\mathbf{v}_A = 0.200v_0 \longleftarrow$ ◀

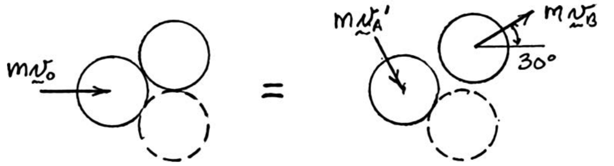
$\mathbf{v}_B = 0.693v_0 \measuredangle 30°$ ◀

$\mathbf{v}_C = 0.693v_0 ⦨ 30°$ ◀

(*b*) *A* strikes *B* before it strikes *C*:

First impact: *A* strikes *B*.

During the impact, the contact impulse makes a 30° angle with the velocity $\mathbf{v}_0$.



Thus, $\mathbf{v}_B = v_B(\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$

Conservation of momentum: $m\mathbf{v}_0 = m\mathbf{v}_A + m\mathbf{v}_B$

y component: $0 = m(v'_A)_y + mv_B \sin 30° \qquad (v'_A)_y = -v_B \sin 30°$

x component: $v_0 = m(v'_A)_x + mv_B \cos 30° \qquad (v'_A)_x = v_0 - v_B \cos 30°$

Conservation of energy:

$$\frac{1}{2}mv_0^2 = \frac{1}{2}m(v'_A)_x^2 + \frac{1}{2}m(v'_A)_y^2 + \frac{1}{2}mv_B^2$$
$$= \frac{1}{2}m(v_0 - v_B \cos 30°)^2 + \frac{1}{2}(v_B \sin 30°)^2 + \frac{1}{2}v_B^2$$
$$= \frac{1}{2}m\left(v_0^2 - 2v_0v_B + v_B^2 \cos^2 30° + v_B^2 \sin^2 30° + v_B^2\right)$$

$$v_B = v_0 \cos 30° = \frac{\sqrt{3}}{2}v_0, \quad (v'_A)_x = v_0 \sin^2 30° = \frac{1}{4}v_0,$$

$$(v'_A)_y = -v_0 \cos 30° \sin 30° = -\frac{\sqrt{3}}{4}v_0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. Second impact: A strikes C.

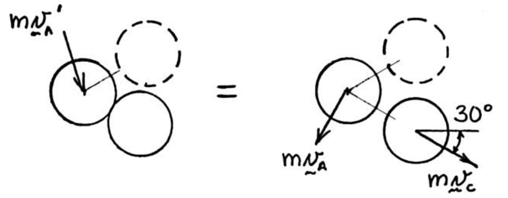
During the impact, the contact impulse makes a $30°$ angle with the velocity $\mathbf{v}_0$.



Thus, $\mathbf{v}_C = v_C(\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$

Conservation of momentum: $m\mathbf{v}'_A = m\mathbf{v}_A + m\mathbf{v}_C$

x component: $m(v'_A)_x = m(v_A)_x + mv_C \cos 30°,$

$$(v_A)_x = (v'_A)_x - v_C \cos 30° = \frac{1}{4}v_0 - v_C \cos 30°$$

y component: $m(v'_A)_y = m(v_A)_y - mv_C \sin 30°$

$$(v_A)_y = (v'_A)_y + v_C \sin 30° = -\frac{\sqrt{3}}{4}v_0 + v_C \sin 30°$$

Conservation of energy:

$$\frac{1}{2}m(v'_A)_x^2 + \frac{1}{2}m(v'_A)_y^2 = \frac{1}{2}m(v_A)_x^2 + \frac{1}{2}m(v_A)_y^2 + \frac{1}{2}mv_C^2$$

$$\frac{1}{2}m\left[\frac{1}{16}v_0^2 + \frac{3}{16}v_0^2\right] = \frac{1}{2}m\left[\left(\frac{1}{4}v_0 - v_C \cos 30°\right)^2 + \left(-\frac{\sqrt{3}}{4}v_0 + v_C \sin 30°\right)^2 + v_C^2\right]$$

$$= \frac{1}{2}m\left[\frac{1}{16}v_0^2 - \frac{1}{2}v_0 v_C \cos 30° + v_C^2 \cos^2 30° + \frac{3}{16}v_0^2 - \frac{\sqrt{3}}{2}v_0 v_C \sin 30° + v_C^2 \sin^2 30° + v_C^2\right]$$

$$0 = -v_0 v_C\left(\frac{1}{2}\cos 30° + \frac{\sqrt{3}}{2}\sin 30°\right) + 2v_C^2$$

$$v_C = v_0\left(\frac{1}{4}\cos 30° + \frac{\sqrt{3}}{4}\sin 30°\right) = \frac{\sqrt{3}}{4}v_0$$

$$(v_A)_x = \frac{1}{4}v_0 - \frac{\sqrt{3}}{4}v_0 \cos 30° = -\frac{1}{8}v_0$$

$$(v_A)_y = -\frac{\sqrt{3}}{4}v_0 + \frac{\sqrt{3}}{4}v_0 \sin 30° = -\frac{\sqrt{3}}{8}v_0$$

$\mathbf{v}_A = 0.250v_0 \measuredangle 60°$ ◀

$\mathbf{v}_B = 0.866v_0 \measuredangle 30°$ ◀

$\mathbf{v}_C = 0.433v_0 \measuredangle 30°$ ◀

PROBLEM 14.45

Two small spheres A and B, of mass 2.5 kg and 1 kg, respectively, are connected by a rigid rod of negligible weight. The two spheres are resting on a horizontal, frictionless surface when A is suddenly given the velocity $\mathbf{v}_0 = (3.5 \text{ m/s})\mathbf{i}$. Determine ($a$) the linear momentum of the system and its angular momentum about its mass center G, (b) the velocities of A and B after the rod AB has rotated through 180°.

SOLUTION

<u>Position of mass center</u>:

$$\bar{y} = \sum \frac{m_i y_i}{m_i} = \frac{2.5(0) + 1(0.2)}{2.5 + 1} = 0.057143 \text{ m}$$

(a) *Linear and angular momentum*:

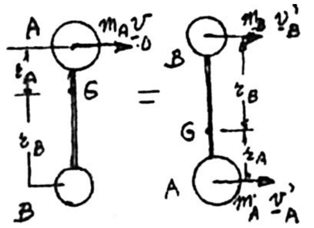
$$L = m_A \mathbf{v}_0 = 2.5 \text{ kg}(3.5 \text{ m/s})\mathbf{i} = (8.75 \text{ kg} \cdot \text{m/s})\mathbf{i}$$

$$\mathbf{L} = (8.75 \text{ kg} \cdot \text{m/s})\mathbf{i} \blacktriangleleft$$

$$\mathbf{H}_G = \overrightarrow{GA} \times m_A \mathbf{v}_0 = (0.05714285 \text{ m})\mathbf{j} \times (8.75 \text{ kg} \cdot \text{m/s})\mathbf{i}$$
$$= -(0.50000 \text{ kg} \cdot \text{m}^2/\text{s})\mathbf{k}$$

$$\mathbf{H}_G = -(0.500 \text{ kg} \cdot \text{m}^2/\text{s})\mathbf{k} \blacktriangleleft$$

(b) *Velocities of A and B after 180° rotation*



Conservation of linear momentum:

$$m_A v_0 = m_A v_A' + m_B v_B'$$
$$(2.5)(3.5) = (2.5)v_A' + (1.0)v_B'$$

$$2.55 v_A' + v_B' = 8.75 \qquad (1)$$

Conservation of angular momentum about G':

$$+\circlearrowright: \quad r_A m_A v_0 = -r_A m_A v_A' + r_B m_B v_B'$$

$$r_B = 0.20 - r_A = 0.14286 \text{ m}$$
$$(0.057143)(2.5)(3.5) = -(0.057143)(2.5)v_A' + (0.14286)(1.0)v_B'$$

Dividing by 0.057143: $$-2.5 v_A' + \frac{0.14286}{0.057143} v_B' = 8.75 \qquad (2)$$

Add Eqs. (1) and (2): $3.5 v_B' = 17.5 \qquad v_B' = +5.00 \text{ m/s}$

From Eq. (1): $2.5 v_A' + (5) = 8.75 \qquad v_A' = +1.50 \text{ m/s}$

$$\mathbf{v}_A' = (1.50 \text{ m/s})\mathbf{i}; \quad \mathbf{v}_B' = (5.00 \text{ m/s})\mathbf{i} \blacktriangleleft$$

PROBLEM 14.46

A 900-lb space vehicle traveling with a velocity $\mathbf{v}_0 = (1500 \text{ ft/s})\mathbf{k}$ passes through the origin *O*. Explosive charges then separate the vehicle into three parts *A*, *B*, and *C*, with masses of 150 lb, 300 lb, and 450 lb, respectively. Knowing that shortly thereafter the positions of the three parts are, respectively, *A*(250, 250, 2250), *B* (600, 1300, 3200), and *C* (–475, –950, 1900), where the coordinates are expressed in ft, that the velocity of *B* is $\mathbf{v}_B = (500 \text{ ft/s})\mathbf{i} + (1100 \text{ ft/s})\mathbf{j} + (2100 \text{ ft/s})\mathbf{k},$ and that the *x* component of the velocity of *C* is -400 ft/s, determine the velocity of part *A*.

SOLUTION

Position vectors (ft):
$$\mathbf{r}_A = 250\mathbf{i} + 250\mathbf{j} + 2250\mathbf{k}$$
$$\mathbf{r}_B = 600\mathbf{i} + 1300\mathbf{j} + 3200\mathbf{k}$$
$$\mathbf{r}_C = -475\mathbf{i} - 950\mathbf{j} + 1900\mathbf{k}$$

Since there are no external forces, linear momentum is conserved.

$$(m_A + m_B + m_C)\mathbf{v}_0 = m_A\mathbf{v}_A + m_B\mathbf{v}_B + m_C\mathbf{v}_C$$

$$\mathbf{v}_A = \frac{m_A + m_B + m_C}{m_A}\mathbf{v}_0 - \frac{m_B}{m_A}\mathbf{v}_B - \frac{m_C}{m_A}\mathbf{v}_C = 6\mathbf{v}_0 - 2\mathbf{v}_B - 3\mathbf{v}_C \qquad (1)$$

$$= (6)(1500\mathbf{k}) - (2)(500\mathbf{i} + 1100\mathbf{j} + 2100\mathbf{k}) - (3)[-400\mathbf{i} + (v_C)_y\mathbf{j} + (v_C)_z\mathbf{k}]$$

$$= -3(v_C)_y\mathbf{j} - 3(v_C)_z\mathbf{k} + 200\mathbf{i} - 2200\mathbf{j} + 4800\mathbf{k}$$

$$(v_A)_x = 200, \quad (v_C)_y = -3(v_C)_y - 2200, \quad (v_A)_z = -3(v_C)_z + 4800$$

Conservation of angular momentum about *O*:

$$(\mathbf{H}_O)_2 = (\mathbf{H}_O)_1$$

Since the vehicle passes through the origin, $(\mathbf{H}_O)_1 = 0.$

$$(\mathbf{H}_O)_2 = \mathbf{r}_A \times (m_A\mathbf{v}_A) + \mathbf{r}_B \times (m_B\mathbf{v}_B) + \mathbf{r}_C \times (m_C\mathbf{v}_C) = 0$$

Divide by m_A.

$$\begin{aligned}
\mathbf{r}_A \times \mathbf{v}_A + \frac{m_B}{m_A}\mathbf{r}_B \times \mathbf{v}_B + \frac{m_C}{m_A}\mathbf{r}_C \times \mathbf{v}_C &= \mathbf{r}_A \times \mathbf{v}_A + 2\mathbf{r}_B \times \mathbf{v}_B + 3\mathbf{r}_C \times \mathbf{v}_C \\
&= \mathbf{r}_A \times (6\mathbf{v}_0 - 2\mathbf{v}_B - 3\mathbf{v}_C) + 2\mathbf{r}_B \times \mathbf{v}_B + 3\mathbf{r}_C \times \mathbf{v}_C \\
&= 3(\mathbf{r}_C - \mathbf{r}_A) \times \mathbf{v}_C + 6\mathbf{r}_A \times \mathbf{v}_0 + 2(\mathbf{r}_B - \mathbf{r}_A) \times \mathbf{v}_B \\
&= (-2175\mathbf{i} - 3600\mathbf{j} - 1050\mathbf{k}) \times \mathbf{v}_C + (1500\mathbf{i} + 1500\mathbf{j} + 13500\mathbf{k}) \times \mathbf{v}_0 \\
&\quad + (700\mathbf{i} + 2100\mathbf{j} + 1900\mathbf{k}) \times \mathbf{v}_B = 0
\end{aligned}$$

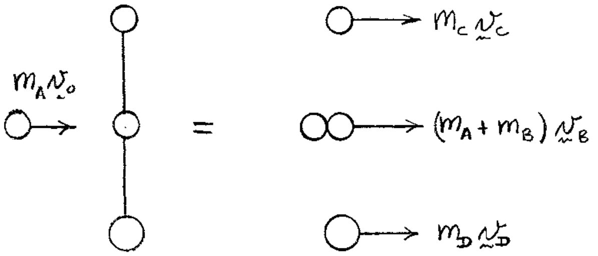
PROBLEM 14.47

Four small disks A, B, C, and D can slide freely on a frictionless horizontal surface. Disks B, C, and D are connected by light rods and are at rest in the position shown when disk B is struck squarely by disk A, which is moving to the right with a velocity $\mathbf{v}_0 = (38.5 \text{ ft/s})\mathbf{i}$. The weights of the disks are $W_A = W_B = W_C = 15$ lb, and $W_D = 30$ lb. Knowing that the velocities of the disks immediately after the impact are $\mathbf{v}_A = \mathbf{v}_B = (8.25 \text{ ft/s})\mathbf{i}$, $\mathbf{v}_C = v_C\,\mathbf{i}$, and $\mathbf{v}_D = v_D\,\mathbf{i}$, determine ($a$) the speeds v_C and v_D, (b) the fraction of the initial kinetic energy of the system which is dissipated during the collision.

SOLUTION

There are no external forces. Momentum is conserved.



(a) Moments about D +↺:

$$3m_A v_0 = 6m_C v_C + 3(m_A + m_B)v_B$$

$$v_C = \frac{3m_A}{6m_C}v_0 - \frac{3(m_A + m_B)}{6m_C}v_B = (0.5)(38.5) - (8.25) = 11$$

$$v_C = 11.00 \text{ ft/s} \blacktriangleleft$$

Moments about C +↻:

$$3m_A v_0 = 3(m_A + m_B)v_B + 6m_D v_D$$

$$v_D = \frac{3m_A v_0}{6m_D} - \frac{3(m_A + m_B)}{6m_D}v_B = (0.25)(38.5) - (0.5)(8.25) = 5.5 \text{ ft/s}$$

$$v_D = 5.50 \text{ ft/s} \blacktriangleleft$$

(b) Initial kinetic energy:

$$T_1 = \frac{1}{2}\frac{W_A}{g}v_0^2 = \frac{1}{2}\frac{15}{32.2}(38.5)^2 = 345.24 \text{ ft}\cdot\text{lb}$$

Final kinetic energy:

$$T_2 = \frac{1}{2}\frac{W_A + W_B}{g}v_B^2 + \frac{1}{2}\frac{W_C}{g}v_C^2 + \frac{1}{2}\frac{W_D}{g}v_D^2$$

$$= \frac{1}{2}\frac{30}{32.2}(8.25)^2 + \frac{1}{2}\frac{15}{32.2}(11.00)^2 + \frac{1}{2}\frac{30}{32.2}(5.50)^2 = 73.98 \text{ ft}\cdot\text{lb}$$

Energy lost:

$$345.24 - 73.98 = 271.26 \text{ ft}\cdot\text{lb}$$

Fraction of energy lost $= \dfrac{271.26}{345.24} = 0.786$

$$\frac{(T_1 - T_2)}{T_1} = 0.786 \blacktriangleleft$$

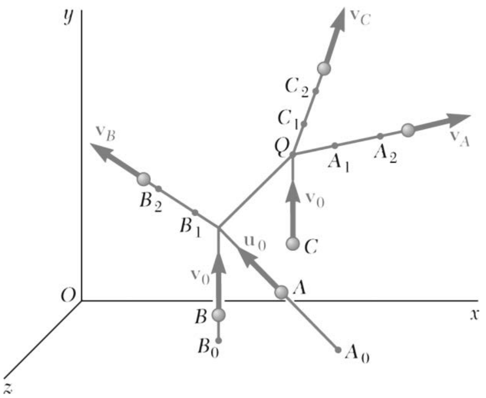
PROBLEM 14.48



In the scattering experiment of Problem 14.26, it is known that the alpha particle is projected from $A_0(300, 0, 300)$ and that it collides with the oxygen nucleus C at $Q(240, 200, 100)$, where all coordinates are expressed in millimeters. Determine the coordinates of Point B_0 where the original path of nucleus B intersects the zx plane. (*Hint:* Express that the angular momentum of the three particles about Q is conserved.)

PROBLEM 14.26 In a scattering experiment, an alpha particle A is projected with the velocity $\mathbf{u}_0 = -(600 \text{ m/s})\mathbf{i} + (750 \text{ m/s})\mathbf{j} - (800 \text{ m/s})\mathbf{k}$ into a stream of oxygen nuclei moving with a common velocity $\mathbf{v}_0 = (600 \text{ m/s})\mathbf{j}$. After colliding successively with nuclei B and C, particle A is observed to move along the path defined by the Points $A_1(280, 240, 120)$ and $A_2(360, 320, 160)$, while nuclei B and C are observed to move along paths defined, respectively, by $B_1(147, 220, 130)$, $B_2(114, 290, 120)$, and by $C_1(240, 232, 90)$ and $C_2(240, 280, 75)$. All paths are along straight lines and all coordinates are expressed in millimeters. Knowing that the mass of an oxygen nucleus is four times that of an alpha particle, determine the speed of each of the three particles after the collisions.

SOLUTION

Conservation of angular momentum about Q:

$$\overrightarrow{QA}_0 \times (m\mathbf{u}_0) + \overrightarrow{QB}_0 \times (4m\mathbf{v}_0) + \overrightarrow{QC}_0 \times (4m\mathbf{v}_0) = \overrightarrow{QA}_1 \times (m\mathbf{v}_A) + \overrightarrow{QB}_1 \times (4m\mathbf{v}_B) + \overrightarrow{QC}_1 \times (4m\mathbf{v}_C)$$

$$\overrightarrow{QA}_0 \times (m\mathbf{u}_0) + \overrightarrow{QB}_0 \times (4m\mathbf{v}_0) + 0 = 0 + \overrightarrow{QB}_1 \times (4m\mathbf{v}_B) + 0 \qquad (1)$$

where

$$\overrightarrow{QA}_0 = \mathbf{r}_{A_0} - \mathbf{r}_Q = (300\mathbf{i} + 300\mathbf{k}) - (240\mathbf{i} + 200\mathbf{j} + 100\mathbf{k})$$

$$= (60 \text{ mm})\mathbf{i} - (200 \text{ mm})\mathbf{j} + (200 \text{ mm})\mathbf{k}$$

$$\overrightarrow{QB}_0 = (\Delta x)\mathbf{i} + (\Delta y)\mathbf{j} + (\Delta z)\mathbf{k}$$

$$\overrightarrow{QB}_1 = \mathbf{r}_{B_1} - \mathbf{r}_Q = (147\mathbf{i} + 220\mathbf{j} + 130\mathbf{k}) - (240\mathbf{i} + 200\mathbf{j} + 100\mathbf{k})$$

$$-(93 \text{ mm})\mathbf{i} + (20 \text{ mm})\mathbf{j} + (30 \text{ mm})\mathbf{k}$$

$$\mathbf{u}_0 = -(600 \text{ m/s})\mathbf{i} + (750 \text{ m/s})\mathbf{j} - (800 \text{ m/s})\mathbf{k} \qquad \mathbf{v}_0 = (600 \text{ m/s})\mathbf{j}$$

and from the solution to Problem 14.26,

$$\mathbf{v}_B = v_B \boldsymbol{\lambda}_B = (716.98)(-0.42290\mathbf{i} + 0.89707\mathbf{j} - 0.12815\mathbf{k})$$

$$= -(303.21 \text{ m/s})\,\mathbf{i} + (643.18 \text{ m/s})\,\mathbf{j} - (91.88 \text{ m/s})\mathbf{k}$$

PROBLEM 14.48 (Continued)

Calculating each term and dividing by *m*,

$$\overrightarrow{QA}_0 \times \mathbf{u}_0 \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 60 & -200 & 200 \\ -600 & 750 & -800 \end{vmatrix} = 10{,}000\mathbf{i} - 72{,}000\mathbf{j} - 75{,}000\mathbf{k}$$

$$\overrightarrow{QB}_0 \times (4\mathbf{v}_0) = [(\Delta x)\mathbf{i} + (\Delta y)\mathbf{j} + (\Delta z)\mathbf{k}] \times (2400\mathbf{j})$$
$$= -2400(\Delta z)\mathbf{i} + 2400(\Delta x)\mathbf{k}$$

$$\overrightarrow{QB}_1 \times (4\mathbf{v}_B) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -93 & 20 & 30 \\ -1212.84 & 2572.72 & -367.52 \end{vmatrix} = -84{,}532\mathbf{i} - 70{,}565\mathbf{j} - 215{,}006\mathbf{k}$$

Collect terms and resolve into components.

$\mathbf{i}$: $10{,}000 - 2400(\Delta z) = -84{,}532 \qquad \Delta z = 39.388 \text{ mm}$

$\mathbf{k}$: $-75{,}000 + 2400(\Delta x) = -215{,}006 \qquad \Delta x = -58.336 \text{ mm}$

Coordinates: $x_{B_0} = x_Q + \Delta x = 240 - 58.336$ $\qquad x_{B_0} = 181.7 \text{ mm}$ ◀

$y_{B_0} = 0$ ◀

$z_{B_0} = z_Q + \Delta z = 100 + 39.388$ $\qquad z_{B_0} = 139.4 \text{ mm}$ ◀

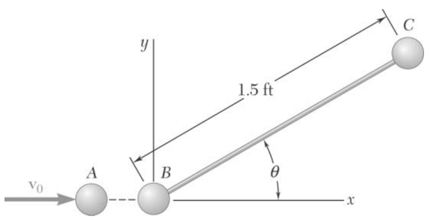
PROBLEM 14.49



Three identical small spheres, each of weight 2 lb, can slide freely on a horizontal frictionless surface. Spheres *B* and *C* are connected by a light rod and are at rest in the position shown when sphere *B* is struck squarely by sphere *A* which is moving to the right with a velocity $\mathbf{v}_0 = (8 \text{ ft/s})\mathbf{i}$. Knowing that $\theta = 45°$ and that the velocities of spheres *A* and *B* immediately after the impact are $\mathbf{v}_A = 0$ and $\mathbf{v}_B = (6 \text{ ft/s})\mathbf{i} + (\mathbf{v}_B)_y\ \mathbf{j}$, determine $(v_B)_y$ and the velocity of *C* immediately after impact.

SOLUTION

Let *m* be the mass of one ball.

Conservation of linear momentum: $(\Sigma m\mathbf{v}) = (\Sigma m\mathbf{v})_0$

$$m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C = m(\mathbf{v}_A)_0 + (m\mathbf{v}_B)_0 + (m\mathbf{v}_C)_0$$

Dividing by *m* and applying numerical data,

$$0 + [(6 \text{ ft/s})\mathbf{i} + (v_B)_y\mathbf{j}] + [(v_C)_x\mathbf{i} + (v_C)_y\mathbf{j}] = (8 \text{ ft/s})\mathbf{i} + 0 + 0$$

Components:

$$x: \quad 6 + (v_C)_x = 8 \qquad\qquad (v_C)_x = 2 \text{ ft/s}$$

$$y: \quad (v_B)_y + (v_C)_y = 0 \qquad\qquad (1)$$

Conservation of angular momentum about *O*:

$$\Sigma[\mathbf{r} \times (m\mathbf{v})] = \Sigma[\mathbf{r} \times (m\mathbf{v}_0)]$$

where $\mathbf{r}_A = 0, \qquad \mathbf{r}_B = 0, \qquad \mathbf{r}_C = (1.5 \text{ ft})(\cos 45°\mathbf{i} + \sin 45°\mathbf{j})$

$$(1.5)(\cos 45°\mathbf{i} + \sin 45°\mathbf{j}) \times [m(v_C)_x\mathbf{i} + m(v_C)_y\mathbf{j}] = 0$$

Since their cross product is zero, the two vectors are parallel.

$$(v_C)_y = (v_C)_x \tan 45° = 2 \tan 45° = 2 \text{ ft/s}$$

From (1), $(v_B)_y = -2$ ft/s

$$(v_B)_y = -2.00 \text{ ft/s} \blacktriangleleft$$

$$\mathbf{v}_C = (2.00 \text{ ft/s})\mathbf{i} + (2.00 \text{ ft/s})\mathbf{j} \blacktriangleleft$$

PROBLEM 14.50

Three small spheres A, B, and C, each of mass m, are connected to a small ring D of negligible mass by means of three inextensible, inelastic cords of length l. The spheres can slide freely on a frictionless horizontal surface and are rotating initially at a speed v_0 about ring D which is at rest. Suddenly the cord CD breaks. After the other two cords have again become taut, determine (a) the speed of ring D, (b) the relative speed at which spheres A and B rotate about D, (c) the fraction of the original energy of spheres A and B which is dissipated when cords AD and BD again became taut.

SOLUTION

Let the system consist of spheres A and B.

State 1: Instant cord DC breaks.

$$m(\mathbf{v}_A)_1 = mv_0\left(-\frac{\sqrt{3}}{2}\mathbf{i} - \frac{1}{2}\mathbf{j}\right)$$

$$m(\mathbf{v}_B)_1 = mv_0\left(\frac{\sqrt{3}}{2}\mathbf{i} - \frac{1}{2}\mathbf{j}\right)$$

$$\mathbf{L}_1 = m(\mathbf{v}_A)_1 + m(\mathbf{v}_B)_1 = -mv_0\mathbf{j}$$

$$\overline{\mathbf{v}} = \frac{\mathbf{L}_1}{2m} = -\frac{1}{2}v_0\mathbf{j}$$

Mass center lies at Point G midway between balls A and B.

$$(\mathbf{H}_G)_1 = \frac{\sqrt{3}}{2}l\mathbf{j} \times (m\mathbf{v}_A)_1 + -\frac{\sqrt{3}}{2}l\mathbf{j} \times (m\mathbf{v}_B)_1$$

$$= \frac{3}{2}lmv_0\mathbf{k}$$

$$T_1 = \frac{1}{2}mv_0^2 + \frac{1}{2}mv_0^2 = mv_0^2$$

State 2: The cord is taut. Conservation of linear momentum:

(a) $$\mathbf{v}_D = \overline{\mathbf{v}} = -\frac{1}{2}v_0\mathbf{j}$$ $v_D = 0.500v_0$ ◀

Let $(\mathbf{v}_A)_2 = \overline{\mathbf{v}} + \mathbf{u}_A$ and $\mathbf{v}_B = \overline{\mathbf{v}} + \mathbf{u}_B$

$$\mathbf{L}_2 = 2m\overline{\mathbf{v}} + m\mathbf{u}_A + m\mathbf{u}_B = \mathbf{L}_1$$

$$\mathbf{u}_B = -\mathbf{u}_A \qquad u_B = u_A$$

$$(\mathbf{H}_G)_2 = lmu_A\mathbf{k} + lmu_B\mathbf{k} = 2lmu_A\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.50 (Continued)

(*b*) Conservation of angular momentum:

$$(\mathbf{H}_G)_2 = (\mathbf{H}_G)_1$$

$$2lmu_A\mathbf{k} = \frac{3}{2}lmv_0\mathbf{k} \qquad u_A = u_B = \frac{3}{4}v_0 \qquad u = 0.750v_0 \blacktriangleleft$$

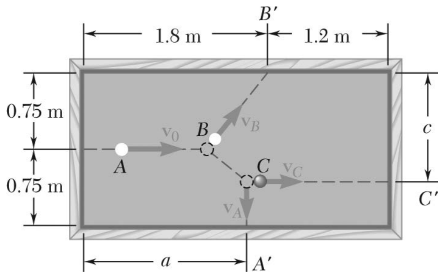
$$T_2 = \frac{1}{2}(2m)\bar{v}^2 + \frac{1}{2}mu_A^2 + \frac{1}{2}mu_B^2$$

$$= \frac{1}{2}mv_0^2\left(\frac{1}{2} + \frac{9}{16} + \frac{9}{16}\right) = \frac{13}{16}mv_0^2$$

(*c*) Fraction of energy lost: $$\frac{T_1 - T_2}{T_1} = \frac{1 - \frac{13}{16}}{1} = \frac{3}{16} \qquad \frac{T_1 - T_2}{T_1} = 0.1875 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.51



In a game of billiards, ball A is given an initial velocity $\mathbf{v}_0$ along the longitudinal axis of the table. It hits ball B and then ball C, which are both at rest. Balls A and C are observed to hit the sides of the table squarely at A' and C', respectively, and ball B is observed to hit the side obliquely at B'. Knowing that $v_0 = 4$ m/s, $v_A = 1.92$ m/s, and $a = 1.65$ m, determine (a) the velocities $\mathbf{v}_B$ and $\mathbf{v}_C$ of balls B and C, (b) the Point C' where ball C hits the side of the table. Assume frictionless surfaces and perfectly elastic impacts (that is, conservation of energy).

SOLUTION

Velocities in m/s. Lengths in meters. Assume masses are 1.0 for each ball.

Before impacts: $(\mathbf{v}_A)_0 = v_0\mathbf{i} = 4\mathbf{i}, \qquad (\mathbf{v}_B)_0 = (\mathbf{v}_C)_0 = 0$

After impacts: $\mathbf{v}_A = -1.92\mathbf{j}, \qquad \mathbf{v}_B = (v_B)_x\mathbf{i} + (v_B)_y\mathbf{j}, \qquad \mathbf{v}_C = v_C\mathbf{i}$

Conservation of linear momentum: $\mathbf{v}_0 = \mathbf{v}_A + \mathbf{v}_B + \mathbf{v}_C$

$$\mathbf{i}:\quad 4 = 0 + (v_B)_x + v_C \qquad (v_B)_x = 4 - v_C$$

$$\mathbf{j}:\quad 0 = -1.92 + (v_B)_y + 0 \qquad (v_B)_y = 1.92$$

Conservation of energy: $\frac{1}{2}v_0^2 = \frac{1}{2}v_A^2 + \frac{1}{2}v_B^2 + \frac{1}{2}v_C^2$

$$\frac{1}{2}(4)^2 = \frac{1}{2}(1.92)^2 + \frac{1}{2}(1.92)^2 + \frac{1}{2}(4 - v_C)^2 + \frac{1}{2}v_C^2$$

$$v_C^2 - 4v_C + 3.6864 = 0$$

$$v_C = \frac{4 \pm \sqrt{(4)^2 - (4)(3.6864)}}{2} = 2 \pm 0.56 = 2.56 \qquad \text{or} \qquad 1.44$$

Conservation of angular momentum about B':

$$0.75v_0 = (1.8 - a)v_A + cv_C$$

$$cv_C = (0.75)(4) - (1.8 - 1.65)(1.92) = 2.712$$

$$c = \frac{2.712}{v_C}$$

If $v_C = 1.44$, $c = 1.8833$ off the table. Reject.

If $v_C = 2.56$, $c = 1.059$

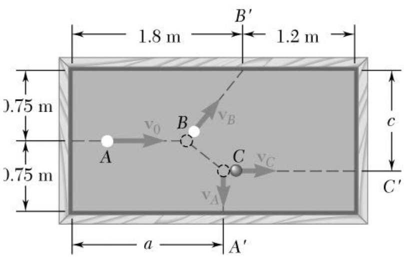
PROBLEM 14.52



For the game of billiards of Problem 14.51, it is now assumed that $v_0 = 5$ m/s, $v_C = 3.2$ m/s, and $c = 1.22$ m. Determine (*a*) the velocities $\mathbf{v}_A$ and $\mathbf{v}_B$ of balls *A* and *B*, (*b*) the Point A' where ball *A* hits the side of the table.

PROBLEM 14.51 In a game of billiards, ball *A* is given an initial velocity $\mathbf{v}_0$ along the longitudinal axis of the table. It hits ball *B* and then ball *C*, which are both at rest. Balls *A* and *C* are observed to hit the sides of the table squarely at A' and C', respectively, and ball *B* is observed to hit the side obliquely at B'. Knowing that $v_0 = 4$ m/s, $v_A = 1.92$ m/s, and $a = 1.65$ m, determine (*a*) the velocities $\mathbf{v}_B$ and $\mathbf{v}_C$ of balls *B* and *C*, (*b*) the Point C' where ball *C* hits the side of the table. Assume frictionless surfaces and perfectly elastic impacts (that is, conservation of energy).

SOLUTION

Velocities in m/s. Lengths in meters. Assume masses are 1.0 for each ball.

Before impacts: $(\mathbf{v}_A)_0 = v_0\mathbf{i} = 5\mathbf{i}, \quad (\mathbf{v}_B)_0 = (\mathbf{v}_C)_0 = 0$

After impacts: $\mathbf{v}_A = -v_A\mathbf{j}, \quad \mathbf{v}_B = (v_B)_x\mathbf{i} + (v_B)_y\mathbf{j}, \quad \mathbf{v}_C = 3.2\mathbf{i}$

Conservation of linear momentum: $\mathbf{v}_0 = \mathbf{v}_A + \mathbf{v}_B + \mathbf{v}_C$

$$\mathbf{i}: \quad 5 = 0 + (v_B)_x + 3.2 \qquad (v_B)_x = 1.8$$

$$\mathbf{j}: \quad 0 = -v_A + (v_B)_y + 0 \qquad (v_B)_y = v_A$$

Conservation of energy: $\frac{1}{2}v_0^2 = \frac{1}{2}v_A^2 + \frac{1}{2}v_B^2 + \frac{1}{2}v_C^2$

$$\frac{1}{2}(5)^2 = \frac{1}{2}(v_A)^2 + \frac{1}{2}(1.8)^2 + \frac{1}{2}(v_A)^2 + \frac{1}{2}(3.2)^2$$

(*a*) $v_A^2 = 11.52 \qquad v_A = 2.4$ $\qquad \mathbf{v}_A = 2.40 \text{ m/s}\downarrow$ ◀

$(v_B)_y = 2.4 \qquad \mathbf{v}_B = 1.8\mathbf{i} + 2.4\mathbf{j}$ $\qquad \mathbf{v}_B = 3.00 \text{ m/s} \measuredangle 53.1°$ ◀

Conservation of angular momentum about B':

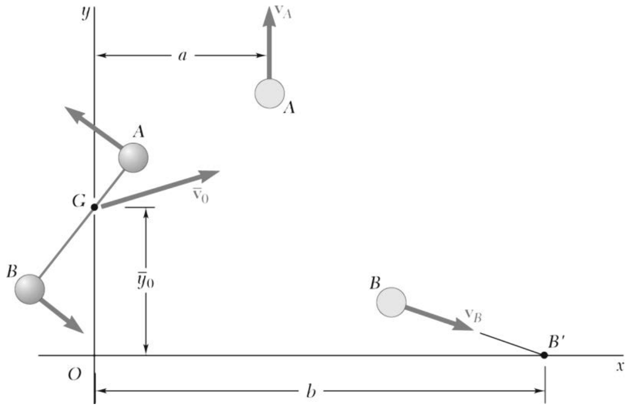
$$0.75v_0 = (1.8 - a)v_A + cv_C$$

$$av_A = 1.8v_A + cv_C - 0.75v_0$$

$$= (1.8)(2.4) + (1.22)(3.2) - (0.75)(5) = 4.474$$

(*b*) $a = \dfrac{4.474}{v_A} = \dfrac{4.474}{2.4}$ $\qquad a = 1.864 \text{ m}$ ◀

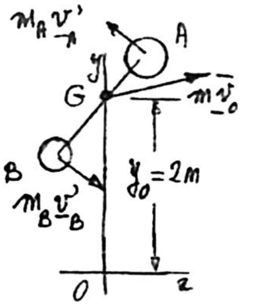
If you are a student using this Manual, you are using it without permission.*



PROBLEM 14.53

Two small disks A and B, of mass 3 kg and 1.5 kg, respectively, may slide on a horizontal, frictionless surface. They are connected by a cord, 600 mm, long, and spin counterclockwise about their mass center G at the rate of 10 rad/s. At $t = 0$, the coordinates of G are $\bar{x}_0 = 0$, $\bar{y}_0 = 2$ m, and its velocity is $\overline{\mathbf{v}}_0 = (1.2 \text{ m/s})\mathbf{i} + (0.96 \text{ m/s})\mathbf{j}$. Shortly thereafter, the cord breaks; disk A is then observed to move along a path parallel to the y axis and disk B along a path which intersects the x axis at a distance $b = 7.5$ m from O. Determine (a) the velocities of A and B after the cord breaks, (b) the distance a from the y-axis to the path of A.

SOLUTION



Initial conditions.

Location of G:

$$\frac{AG}{m_B} = \frac{BG}{m_A} = \frac{AG + GB}{m_B + m_A} = \frac{AB}{m} = \frac{0.6 \text{ m}}{4.5 \text{ kg}}$$

$$AG = 1.5\left(\frac{0.6}{4.5}\right) = 0.2 \text{ m}$$

$$BG = 0.4 \text{ m}$$

Linear momentum:

$$\mathbf{L}_0 = m\overline{\mathbf{v}}_0 = (4.5 \text{ kg})(1.2\mathbf{i} + 0.96\mathbf{j})$$
$$= 5.4\mathbf{i} + 4.32\mathbf{j}$$

Angular momentum:

About G:

$$(\mathbf{H}_G)_0 = \overrightarrow{GA} \times m_A \mathbf{v}'_A + \overrightarrow{GB} \times m_B \mathbf{v}'_B$$
$$= (0.2 \text{ m})(3 \text{ kg})(0.2 \text{ m} \times 10 \text{ rad/s})\mathbf{k}$$
$$+ (0.4 \text{ m})(1.5 \text{ kg})(0.4 \text{ m} \times 10 \text{ rad/s})\mathbf{k}$$

$$(\mathbf{H}_G)_0 = (3.6 \text{ kg} \cdot \text{m}^2/\text{s})\mathbf{k}$$

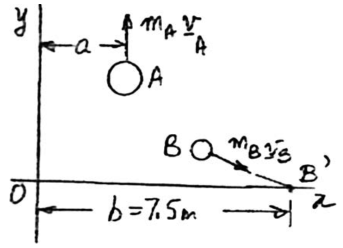
About O: Using formula derived in Problem 14.27,

$$(\mathbf{H}_O)_0 = \overline{\mathbf{r}} \times m\overline{\mathbf{v}}_0 + (\mathbf{H}_G)_0$$
$$= 2\mathbf{j} \times (5.4\mathbf{i} + 4.32\mathbf{j}) + 3.6\mathbf{k}$$
$$= -10.8\mathbf{k} + 3.6\mathbf{k} = -(7.2 \text{ kg} \cdot \text{m}^2/\text{s})\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Kinetic energy: Using Eq. (14.29),

$$T_0 = \frac{1}{2}m\bar{v}_0^2 + \frac{1}{2}\sum_i m: \quad v_i'^2 = \frac{1}{2}m\bar{v}_0^2 + \frac{1}{2}m_A v_A'^2 + \frac{1}{2}m_B v_B'^2$$
$$= \frac{1}{2}(4.5)[(1.2)^2 + (0.96)^2] + \frac{1}{2}(3)(0.2\times 10)^2 + \frac{1}{2}(1.5)(0.4\times 10)^2$$
$$= (5.3136 + 6 + 12) = 23.314 \text{ J}$$



(*a*) Conservation of linear momentum:

$$\mathbf{L}_0 = \mathbf{L}$$
$$5.4\mathbf{i} + 4.32\mathbf{j} = m_A\mathbf{v}_A + m_B\mathbf{v}_B$$
$$= 3(v_A\mathbf{j}) + 1.5[(v_B)_z\mathbf{i} + (v_B)_y\mathbf{j}]$$

Equating coefficients of **i**: $5.4 = 1.5(v_B)_x$

$$(v_B)_x = 3.6 \text{ m/s} \qquad (1)$$

Equating coefficients of **j**: $4.32 = 3v_A + 1.5(v_B)_y$

$$(v_B)_y = 2.88 - 2v_A \qquad (2)$$

Conservation of energy:

$$T_0 = T: \quad T_0 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2$$

$$23.314 \text{ J} = \frac{1}{2}(3)\left(v_A^2\right) + \frac{1}{2}(1.5)[(v_B)_x^2 + (v_B)_y^2]$$

Substituting from Eqs. (1) and (2):

$$23.314 = 1.5v_A^2 + 0.75(3.6)^2 + 0.75(2.88 - 2v_A)^2$$
$$4.5v_A^2 - 8.64v_A - 7.373 = 0$$
$$v_A^2 - 1.92v_A - 1.6389 = 0$$

$$v_A = 0.96 + 1.60 = 2.56 \text{ m/s} \qquad \mathbf{v}_A = 2.56 \text{ m/s} \uparrow \blacktriangleleft$$

and $v_A = 0.96 - 1.60 = -0.64$ m/s (rejected, since $\mathbf{v}_A$ is shown directed up)

From Eqs. (1) and (2): $(v_B)_x = 3.6$ m/s

$$(v_B)_y = 2.88 - 2(2.56) = -2.24 \text{ m/s}$$

$$\mathbf{v}_B = 3.6\mathbf{i} - 2.24\mathbf{j} \qquad \mathbf{v}_B = 4.24 \text{ m/s} \searrow 31.9° \blacktriangleleft$$

(*b*) Conservation of angular momentum about *O*:

$$(\mathbf{H}_O)_0 = \mathbf{H}_O: \quad -7.2\mathbf{k} = a\mathbf{i}\times m_A\mathbf{v}_A + b\mathbf{i}\times m_B\mathbf{v}_B$$
$$-7.2\mathbf{k} = a\mathbf{i}\times 3(2.56\mathbf{j}) + 7.5\mathbf{i}\times 1.5(3.6\mathbf{i} - 2.24\mathbf{j})$$
$$-7.2\mathbf{k} = 7.68a\mathbf{k} - 25.2\mathbf{k} \qquad a = 2.34 \text{ m} \blacktriangleleft$$

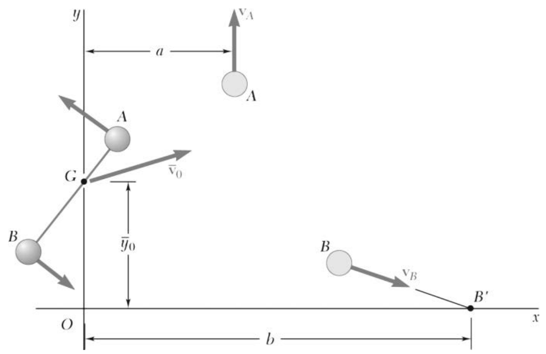
PROBLEM 14.54

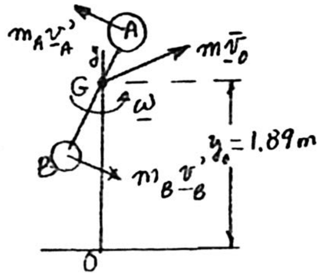


Two small disks A and B, of mass 2 kg and 1 kg, respectively, may slide on a horizontal and frictionless surface. They are connected by a cord of negligible mass and spin about their mass center G. At $t = 0$, G is moving with the velocity $\overline{\mathbf{v}}_0$ and its coordinates are $\overline{x}_0 = 0$, $\overline{y}_0 = 1.89$ m. Shortly thereafter, the cord breaks and disk A is observed to move with a velocity $\mathbf{v}_A = (5\text{ m/s})\mathbf{j}$ in a straight line and at a distance $a = 2.56$ m from the y-axis, while B moves with a velocity $\mathbf{v}_B = (7.2\text{ m/s})\mathbf{i} - (4.6\text{ m/s})\mathbf{j}$ along a path intersecting the x-axis at a distance $b = 7.48$ m from the origin O. Determine (a) the initial velocity $\overline{\mathbf{v}}_0$ of the mass center G of the two disks, (b) the length of the cord initially connecting the two disks, (c) the rate in rad/s at which the disks were spinning about G.

SOLUTION

Initial conditions.

Location of G:



$$\frac{AG}{m_B} = \frac{BG}{m_A} = \frac{AG + GB}{m_B + m_A} = \frac{l}{m}$$

$$AG = \frac{m_B}{m} l = \frac{1}{3} l$$

$$BG = \frac{m_A}{m} l = \frac{2}{3} l$$

Linear momentum:

$$\mathbf{L}_0 = m\overline{\mathbf{v}}_0 = 3\overline{\mathbf{v}}_0$$

Angular momentum about G:

$$(\mathbf{H}_G)_0 = \overrightarrow{GA} \times m_A \mathbf{v}'_A + \overrightarrow{GB} \times m_B \mathbf{v}'_B$$

$$= \left(\frac{1}{3} l\right)(2\text{ kg})\left(\frac{1}{3} l\omega\right)\mathbf{k} + \left(\frac{2}{3} l\right)(1\text{ kg})\left(\frac{2}{3} l\omega\right)\mathbf{k}$$

$$= \frac{2}{3} l^2 \omega \mathbf{k}^2$$

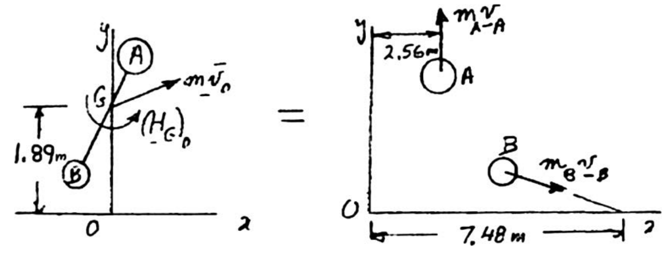
Kinetic energy: Using Eq. (14.29),

$$T_0 = \frac{1}{2} m\overline{v}_0^2 + \frac{1}{2}\sum_i m_i v_i^2 = \frac{1}{2} m\overline{v}_0^2 + \frac{1}{2} m_A v_A'^2 + \frac{1}{2} m_B v_B'^2$$

$$= \frac{1}{2}(3)\overline{v}_0^2 + \frac{1}{2}(2)\left(\frac{1}{3} l\omega\right)^2 + \frac{1}{2}(1)\left(\frac{2}{3} l\omega\right)^2$$

$$T_0 = \frac{3}{2}\overline{v}_0^2 + \frac{1}{3} l^2 \omega^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



Conservation of linear momentum:

$$m\overline{\mathbf{v}}_0 = m_A\mathbf{v}_A + m_B\mathbf{v}_B$$

$$3\overline{\mathbf{v}}_0 = (2)(5\mathbf{j}) + (1)(7.2\mathbf{i} - 4.6\mathbf{j}) = 7.2\mathbf{i} + 5.4\mathbf{j}$$

(*a*) $\overline{\mathbf{v}}_0 = (2.4 \text{ m/s})\mathbf{i} + (1.8 \text{ m/s})\mathbf{j}$ ◀

Conservation of angular momentum about *O*:

$$+\circlearrowleft: \quad (1.89\mathbf{j})\times m\overline{\mathbf{v}}_0 + (\mathbf{H}_G)_0 = (2.56\mathbf{i})\times m_A\mathbf{v}_A + (7.48\mathbf{i})\times m_B\mathbf{v}_A$$

Substituting for $\overline{\mathbf{v}}_0$, $(\mathbf{H}_G)_0$, $\mathbf{v}_A$, $\mathbf{v}_B$ and masses:

$$(1.89\mathbf{j})\times 3(2.4\mathbf{i} + 1.8\mathbf{j}) + \frac{2}{3}l^2\omega\mathbf{k} = (2.56\mathbf{i})\times 2(5\mathbf{j}) + (7.48\mathbf{i})\times(7.2\mathbf{i} - 4.6\mathbf{j})$$

$$-13.608\mathbf{k} + \frac{2}{3}l^2\omega\mathbf{k} = 25.6\mathbf{k} - 34.408\mathbf{k}$$

$$\frac{2}{3}l^2\omega = 4.80 \qquad l^2\omega = 7.20 \tag{1}$$

Conservation of energy:

$$T_0 = T: \quad \frac{3}{2}\overline{v}_0^2 + \frac{1}{3}l^2\omega^2 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2$$

$$\frac{3}{2}[(2.4)^2 + (1.8)^2] + \frac{1}{3}l^2\omega^2 = \frac{1}{2}(2)(5)^2 + \frac{1}{2}(1)[(7.2)^2 + (4.6)^2]$$

$$13.5 + \frac{1}{3}l^2\omega^2 = 25 + 36.5 \qquad l^2\omega^2 = 144.0 \tag{2}$$

Dividing Eq. (2) by Eq. (1), member by member:

$$\omega = \frac{144.0}{7.20} = 20.0 \text{ rad/s}$$

(*c*) Original rate of spin = 20.0 rad/s ◀

Substituting for ω into Eq. (1):

$$l^2(20.0) = 7.20 \qquad l^2 = 0.360 \qquad l = 0.600 \text{ m}$$

(*b*) Length of cord = 600 mm ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.55

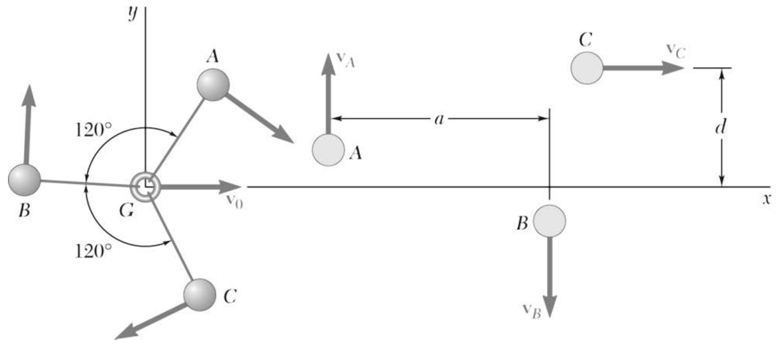
Three small identical spheres A, B, and C, which can slide on a horizontal, frictionless surface, are attached to three 9-in-long strings, which are tied to a ring G. Initially, the spheres rotate clockwise about the ring with a relative velocity of 2.6 ft/s and the ring moves along the x-axis with a velocity $\mathbf{v}_0 = (1.3 \text{ ft/s})\mathbf{i}$. Suddenly, the ring breaks and the three spheres move freely in the xy plane with A and B, following paths parallel to the y-axis at a distance $a = 1.0$ ft from each other and C following a path parallel to the x-axis. Determine (a) the velocity of each sphere, (b) the distance d.



SOLUTION

Conservation of linear momentum:

Before break: $\mathbf{L}_0 = (3m)\overline{\mathbf{v}} = 3m(1.3\mathbf{i}) = m(3.9 \text{ ft/s})\mathbf{i}$

After break: $\mathbf{L} = mv_A\mathbf{j} - mv_B\mathbf{j} + mv_C\mathbf{i}$

$\mathbf{L} = \mathbf{L}_0$: $mv_C\mathbf{i} + m(v_A - v_B)\mathbf{j} = m(3.9 \text{ ft/s})\mathbf{i}$

Therefore, $v_A = v_B$ (1)

$v_C = 3.9000$ ft/s $\quad \mathbf{v}_C = 3.90 \text{ ft/s} \longrightarrow$ (2)

Conservation of angular momentum:

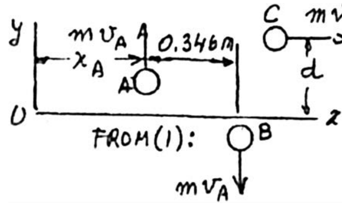
Before break: $+\circlearrowright (H_O)_0 = 3mlv' = 3m(0.75\,\text{ft})(2.6 \text{ ft/s})$

$= 5.85m$

After break: $H_O = -mv_Ax_A$

$+ mv_A(x_A + 0.346)$

$+ mv_Cd$



$+\circlearrowright H_O = -m_Ax_A + mv_A(x_A + 1.0) + mv_Cd$

$H_O = (H_O)_0$: $1.0mv_A + mv_Cd = 5.85m$

Recalling Eq. (2):

$v_A + 3.9d = 5.85$

$d = 1.5 - 0.25641v_A$ (3)

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.55 (Continued)

Conservation of energy.

Before break:

$$T_0 = \frac{1}{2}(3m)\bar{v}^2 + 3\left(\frac{1}{2}mv'^2\right)$$

$$= \frac{3}{2}m\left(v_0^2 + v'^2\right) = \frac{3}{2}[(1.3)^2 + (2.6)^2]m = 12.675m$$

After break:

$$T = \frac{1}{2}mv_A^2 + \frac{1}{2}mv_B^2 + \frac{1}{2}mv_C^2$$

$T = T_0$: Substituting for v_B from Eq. (1) and v_C from Eq. (2),

$$\frac{1}{2}\left[v_A^2 + v_A^2 + (3.900)^2\right] = 12.675$$

$$v_A^2 = 5.0700$$

$$v_A = v_B = 2.2517 \text{ ft/s}$$

(*a*) *Velocities*:

$$\mathbf{v}_A = 2.25 \text{ ft/s} \uparrow; \ \mathbf{v}_B = 2.25 \text{ ft/s} \downarrow; \ \mathbf{v}_C = 3.9 \text{ ft/s} \longrightarrow \blacktriangleleft$$

(*b*) *Distance d*:

From Eq. (3): $d = 1.5 - 0.25641(2.2517) = 0.92265$ ft $\qquad d = 11.1$ in. ◀

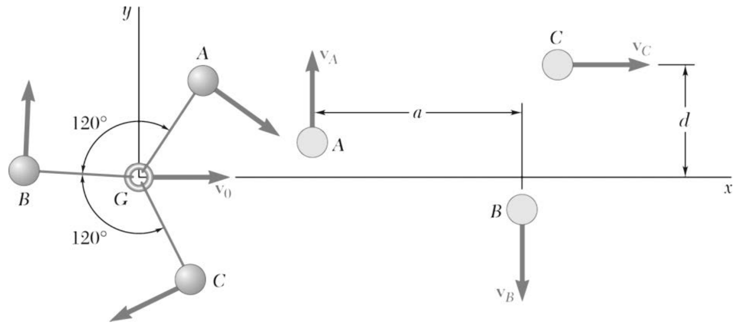
PROBLEM 14.56

Three small identical spheres A, B, and C, which can slide on a horizontal, frictionless surface, are attached to three strings of length l which are tied to a ring G. Initially, the spheres rotate clockwise about the ring which moves along the x axis with a velocity $\mathbf{v}_0$. Suddenly the ring breaks and the three spheres move freely in the xy plane. Knowing that $\mathbf{v}_A = (3.5 \text{ ft/s})\mathbf{j}$, $\mathbf{v}_C = (6.0 \text{ ft/s})\mathbf{i}$, $a = 16$ in. and $d = 9$ in., determine (a) the initial velocity of the ring, (b) the length l of the strings, (c) the rate in rad/s at which the spheres were rotating about G.



SOLUTION

Conservation of linear momentum:

$$(3m)\bar{\mathbf{v}} = m\mathbf{v}_A + m\mathbf{v}_B + m\mathbf{v}_C$$
$$3mv_0\mathbf{i} = m(3.5 \text{ ft/s})\mathbf{j} - mv_B\mathbf{j} + m(6.0 \text{ ft/s})\mathbf{i}$$

Equating coefficients of unit vectors:

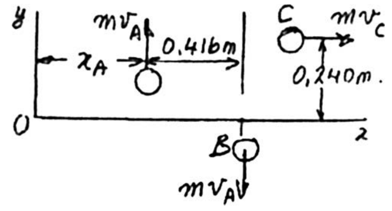
$$3v_0 = 6.00 \text{ ft/s}$$
$$0 = 3.5 \text{ ft/s} - \mathbf{v}_B \qquad v_B = 3.5 \text{ ft/s} \qquad (1)$$

$$v_0 = 2.00 \text{ ft/s} \longrightarrow$$

(a) Conservation of angular momentum:

Before break: $+\circlearrowright (H_O)_0 = 3ml^2\dot{\theta}$

After break:
$$H_O = -mv_Ax_A + mv_A(x_A + 16/12) + mv_C(9/12)$$
$$= m(3.5)(16/12) + m(6.0)(9/12)$$
$$= m(9.1667)$$



$(H_O)_0 = H_0$: $\quad 3ml^2\dot{\theta} = m(9.1667) \qquad l^2\dot{\theta} = 3.0556 \qquad (2)$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.57

A stream of water of cross-sectional area A_1 and velocity $\mathbf{v}_1$ strikes a circular plate which is held motionless by a force **P**. A hole in the circular plate of area A_2 results in a discharge jet having a velocity $\mathbf{v}_1$. Determine the magnitude of **P**.

SOLUTION

<u>Mass flow rates</u>. As the fluid ahead of the plate moves from section 1 to section 2 Δt, the mass Δm_1 moved is

$$\Delta m_1 = \rho A_1(\Delta t) = \rho A_1 v_1(\Delta t)$$

so that

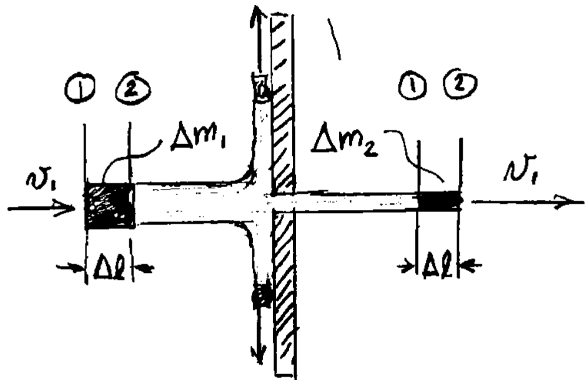
$$\frac{dm_1}{dt} = \frac{\Delta m_1}{\Delta t} = \rho A_1 v_1$$

Likewise, for the fluid that has passed through the hole

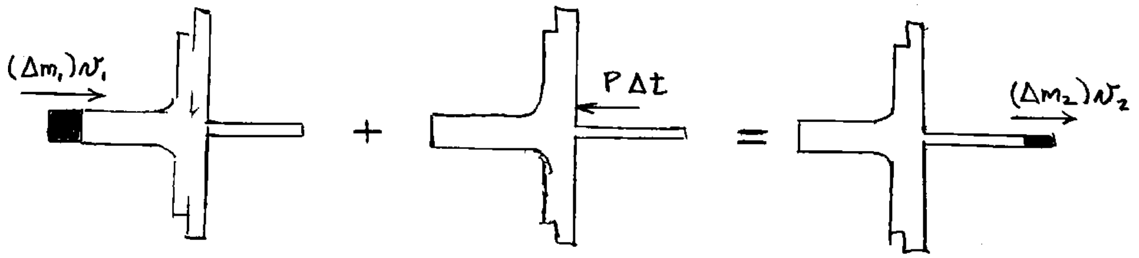
$$\Delta m_2 = \rho A_2(\Delta l) = \rho A_2 v_1(\Delta t)$$

so that

$$\frac{dm_2}{dt} = \rho A_2 v_1$$



Apply the impulse-momentum principle.



$$\Sigma m\mathbf{v}_1 + \int \mathbf{F}\,dt = \Sigma m\mathbf{v}_2$$

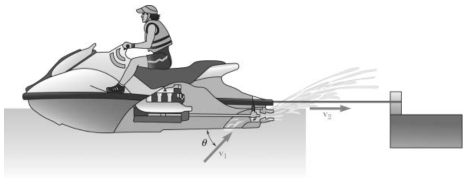
Components in the direction of the flow.

$$(\Delta m_1)v_1 - P\Delta t = (\Delta m_2)v_1$$

$$P = \frac{\Delta m_1}{\Delta t}v_1 - \frac{\Delta m_2}{\Delta t}v_1 = \rho A_1 v_1^2 - \rho A_2 v_1^2$$

$$P = \rho(A_1 - A_2)v_1^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 14.58

A jet ski is placed in a channel and is tethered so that it is stationary. Water enters the jet ski with velocity $\mathbf{v}_1$ and exits with velocity $\mathbf{v}_2$. Knowing the inlet area is A_1 and the exit area is A_2, determine the tension in the tether.

SOLUTION

Mass flow rates. Consider a cylindrical portion of the fluid lying in a section of pipe of cross sectional area A and length Δl.

The volume and mass are

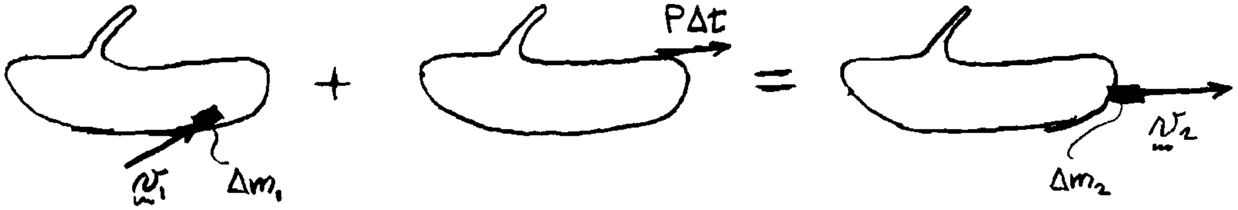
$$\Delta m = \rho A(\Delta l)$$

Then
$$\frac{\Delta m}{\Delta t} = \rho A \frac{\Delta l}{\Delta t} = \rho A v$$

At the pipe inlet and outlet, we get

$$\frac{\Delta m_1}{\Delta t} = \rho A_1 v_1, \qquad \frac{\Delta m_2}{\Delta t} = \rho A_2 v_2$$

Impulse and momentum principle:



$$\Sigma m\mathbf{v}_1 + \text{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$

Using horizontal components $(+\rightarrow)$,

$$(\Delta m_1)v_1\cos\theta + P(\Delta t) = (\Delta m_2)v_2$$

$$P = \frac{\Delta m_1}{\Delta t}v_2 - \frac{\Delta m_1}{\Delta t}v_1\cos\theta$$
$$= \rho A_2 v_2^2 - \rho A_1 v_1^2\cos\theta$$

$$P = \rho A_2 v_2^2 - \rho A_1 v_1^2\cos\theta \;\blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.59

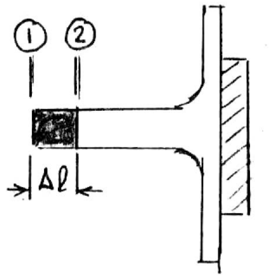
A stream of water of cross-sectional area A and velocity $\mathbf{v}_1$ strikes a plate which is held motionless by a force **P**. Determine the magnitude of **P**, knowing that $A = 0.75\ \text{in}^2$, $v_1 = 80\ \text{ft/s}$, and $V = 0$.

SOLUTION

Mass flow rate. As the fluid moves from section 1 to section 2 in time Δt, the mass Δm moved is

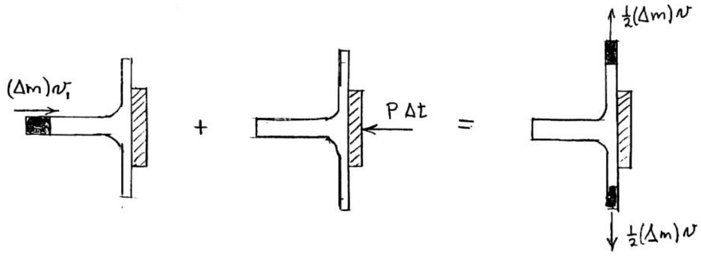


$$\Delta m = \rho A(\Delta l)$$

Then
$$\frac{dm}{dt} = \frac{\Delta m}{\Delta t} = \frac{\rho A(\Delta l)}{\Delta t} = \rho A v_1$$

Data: $\gamma = 62.4\ \text{lb/ft}^3$, $A = 0.75\ \text{in.}^2 = 0.0052083\ \text{ft}^2$, $v_1 = 80\ \text{ft/s}$

$$\frac{dm}{dt} = \frac{(62.4)}{32.2}(0.0052083)(80) = 0.80745\ \text{slug/s}$$



Principle of impulse and momentum:

$$\xrightarrow{+}: \quad (\Delta m)v_1 - P\Delta t = 0$$

$$P = \frac{\Delta m}{\Delta t}v = \frac{dm}{dt}v$$

$$P = (0.80745)(80) = 64.596\ \text{lb}$$

$P = 64.6\ \text{lb}$ ◀

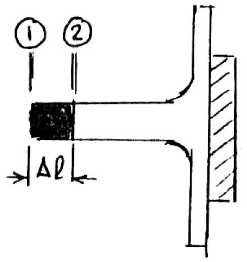
PROBLEM 14.60

A stream of water of cross-sectional area A and velocity $\mathbf{v}_1$ strikes a plate which moves to the right with a velocity $\mathbf{V}$. Determine the magnitude of $\mathbf{V}$, knowing that $A = 1\ \text{in}^2$, $v_1 = 100$ ft/s, and $P = 90$ lb.

SOLUTION



Consider velocities measured with respect to the plate, which is moving with velocity V. The velocity of the stream relative to the plate is

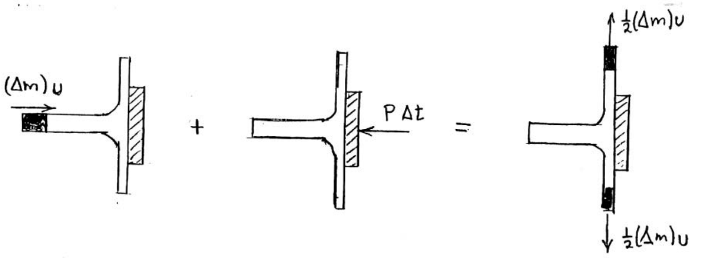
$$\mathbf{u} = \mathbf{v}_1 - \mathbf{V} \qquad (1)$$

Mass flow rate. As the fluid moves from section 1 to section 2 in time Δt, the mass Δm moved is

$$\Delta m = \rho A(\Delta l)$$

Then

$$\frac{dm}{dt} = \frac{\Delta m}{\Delta t} = \frac{\rho A(\Delta l)}{\Delta t} = \rho A u \qquad (2)$$



Principle of impulse and momentum:

$$\xrightarrow{+} \quad (\Delta m)u - P(\Delta t) = 0$$

$$P = \frac{\Delta m}{\Delta t}u = \frac{dm}{dt}u = \rho A u^2$$

$$u = \sqrt{\frac{P}{\rho A}}$$

PROBLEM 14.61

A rotary power plow is used to remove snow from a level section of railroad track. The plow car is placed ahead of an engine which propels it at a constant speed of 20 km/h. The plow car clears 160 Mg of snow per minute, projecting it in the direction shown with a velocity of 12 m/s relative to the plow car. Neglecting friction, determine (*a*) the force exerted by the engine on the plow car, (*b*) the lateral force exerted by the track on the plow.

SOLUTION

Velocity of the plow: $v_P = 20 \text{ km/h} = 5.5556 \text{ m/s}$

Velocity of thrown snow:

$$\mathbf{v}_s = (12 \text{ m/s})(\cos 30°\mathbf{i} + \sin 30°\mathbf{j}) + (5.5556 \text{ m/s})\mathbf{k}$$

Mass flow rate:

$$\frac{dm}{dt} = \frac{(160000 \text{ kg/min})}{(60 \text{ s/min})} = 2666.7 \text{ kg/s}$$

Let F be the force exerted on the plow and the snow.

Apply impulse-momentum, noting that the snow is initially at rest and that the velocity of the plow is constant. Neglect gravity.

$$\mathbf{F}(\Delta t) = (\Delta m)\mathbf{v}_s$$

$$\mathbf{F} = \left(\frac{dm}{dt}\right)v_s = (2.666.7)(12\cos 30°\mathbf{i} + 12\sin 30°\mathbf{j} + 5.5556\mathbf{k})$$

$$= (27713 \text{ N})\mathbf{i} + (16000 \text{ N})\mathbf{j} + (14815 \text{ N})\mathbf{k}$$

(*a*) Force exerted by engine. $F_z = 14.8 \text{ kN}$ ◀

(*b*) Lateral force exerted by track. $F_x = 27.7 \text{ kN}$ ◀

PROBLEM 14.64

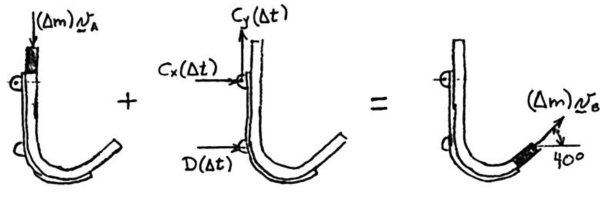
The stream of water shown flows at a rate of 550 liters/min and moves with a velocity of magnitude 18 m/s at both A and B. The vane is supported by a pin and bracket at C and by a load cell at D which can exert only a horizontal force. Neglecting the weight of the vane, determine the components of the reactions at C and D.

SOLUTION

Mass flow rate:
$$\frac{dm}{dt} = \rho Q = \frac{(1000\text{ kg/m}^3)(550\text{ liters/min})(1\text{ min})}{(1000\text{ liters/m}^3)(60\text{ sec})}$$
$$\frac{dm}{dt} = 9.1667\text{ kg/s}$$

Velocity vectors: $\mathbf{v}_A = 18\text{ m/s}\downarrow \qquad \mathbf{v}_B = 18\text{ m/s} \measuredangle 40°$

Apply the impulse-momentum principle.



+↺ Moments about C: $-0.040(\Delta m)v_A + 0.150D(\Delta t) = 0.200(\Delta m)v_B\cos 40° + 0.165(\Delta m)v_B\sin 40°$

$$D = \frac{1}{0.150}\left(\frac{\Delta m}{\Delta t}\right)[0.200v_B\cos 40° + 0.165v_B\sin 40° + 0.040v_A]$$
$$= \frac{1}{0.150}(9.1667)[(0.200)(18)\cos 40° + 0.165(18)\sin 40° + 0.040(18)]$$

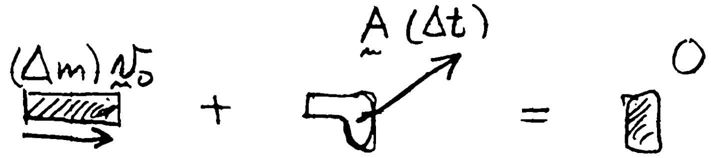
PROBLEM 14.68

A mass q of sand is discharged per unit time from a conveyor belt moving with a velocity $\mathbf{v}_0$. The sand is deflected by a plate at A so that it falls in a vertical stream. After falling a distance h the sand is again deflected by a curved plate at B. Neglecting the friction between the sand and the plates, determine the force required to hold in the position shown (a) plate A, (b) plate B.

SOLUTION

(a) When the sand impacts on plate A, it is momentarily brought to rest. Apply the principle of impulse and momentum to find the force on the sand.



$\xrightarrow{+}$ x component: $$(\Delta m)v_0 + A_x(\Delta t) = 0$$

$$A_x = -\frac{\Delta m}{\Delta t}v_0 = -qv_0$$

$+\uparrow$ y component: $$0 + A_y(\Delta t) = 0 \qquad A_y = 0$$

$$\mathbf{A} = qv_0 \longleftarrow \blacktriangleleft$$

The sand falls vertically. Use conservation of energy for mass element Δm. Let v be the speed at the curved portion of plate B.

$$T_1 + V_1 = T_2 + V_2: \quad 0 + (\Delta m)gh = \frac{1}{2}(\Delta m)v^2 + 0$$

$$v^2 = 2gh$$

$$v = \sqrt{2gh}$$

Over the curved portion of plate B, there is negligible change of elevation. Hence, by conservation of energy, v is both the entrance speed and exit speed of the curved portion of plate B.

(b) Force exerted through plate B:

Entrance velocity: $$\mathbf{v} = -\sqrt{2gh}\,\mathbf{j}$$

Exit velocity: $$\mathbf{v}' = \sqrt{2gh}\,(-\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$$

Mass flow rate: $$\frac{dm}{dt} = \frac{\Delta m}{\Delta t} = q$$

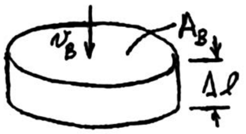
PROBLEM 14.72

The helicopter shown can produce a maximum downward air speed of 80 ft/s in a 30-ft-diameter slipstream. Knowing that the weight of the helicopter and its crew is 3500 lb and assuming $\gamma = 0.076 \text{ lb/ft}^3$ for air, determine the maximum load that the helicopter can lift while hovering in midair.

SOLUTION

The thrust is
$$F = \frac{dm}{dt}(v_B - v_A)$$

Calculation of $\frac{dm}{dt}$. mass = density × volume = density × area × length



$$\Delta m = \rho A_B(\Delta l) = \rho A_B v_B(\Delta t)$$
$$\frac{\Delta m}{\Delta t} = \rho A_B v_B = \frac{\gamma}{g} A_B v_B = \frac{dm}{dt}$$

where A_B is the area of the slipstream well below the helicopter and v_B is the corresponding velocity in the slipstream. Well above the blade, $v_A \approx 0$.

Hence,
$$F = \frac{\gamma}{g} A_B v_B^2$$
$$= \left(\frac{0.076 \text{ lb/ft}^3}{32.2 \text{ ft/s}^2}\right)\left(\frac{\pi}{4}\right)(30 \text{ ft})^2 (80 \text{ ft/s})^2$$
$$= 10{,}678 \text{ lb}$$
$$F = 10{,}678 \text{ lb} \downarrow$$

The force on the helicopter is 10,678 lb $\uparrow$.

Weight of helicopter: $\mathbf{W}_H = 3500 \text{ lb} \downarrow$

Weight of payload: $\mathbf{W}_P = W_P \downarrow$

Statics: $+\uparrow \Sigma F_y = F - W_H - W_P = 0$

$$W_P = F - W_H = 10{,}678 - 3500 = 7178 \text{ lb}$$

$W = 7180 \text{ lb}$ ◀

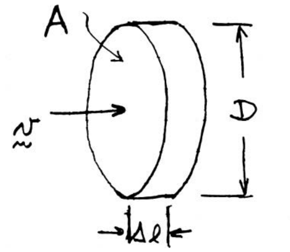
PROBLEM 14.73

A floor fan designed to deliver air at a maximum velocity of 6 m/s in a 400-mm-diameter slipstream is supported by a 200-mm-diameter circular base plate. Knowing that the total weight of the assembly is 60 N and that its center of gravity is located directly above the center of the base plate, determine the maximum height h at which the fan may be operated if it is not to tip over. Assume $\rho = 1.21\ \text{kg/m}^3$ for air and neglect the approach velocity of the air.

SOLUTION

Calculation of $\frac{dm}{dt}$ at a section in the airstream:



$$\text{mass} = \text{density} \times \text{volume} = \text{density} \times \text{area} \times \text{length}$$

$$\Delta m = \rho A(\Delta l) = \rho A v(\Delta t)$$

$$\frac{\Delta m}{\Delta t} = \frac{dm}{dt} = \rho A v$$

Thrust on the airstream:

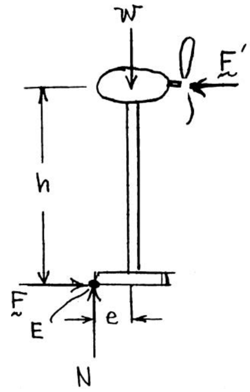
$$\mathbf{F} = \frac{dm}{dt}(\mathbf{v}_B - \mathbf{v}_A)$$

where $\mathbf{v}_B$ is the velocity just downstream of the fan and $\mathbf{v}_A$ is the velocity for upstream. Assume that $\mathbf{v}_A$ is negligible.

$$F = (\rho A v)v = \rho\left(\frac{\pi}{4}D^2\right)v^2$$

$$F = (1.21\ \text{kg/m}^3)\left(\frac{\pi}{4}\right)(0.400\ \text{m})^2(6\ \text{m/s})^2 = 5.474\ \text{N}$$

$$\mathbf{F} = 5.474\ \text{N} \longrightarrow$$



Force on fan: $\mathbf{F}' = -\mathbf{F} = 5.474\ \text{N} \longleftarrow$

Maximum height h: $\left(e = \frac{1}{2}d = 100\ \text{mm} = 0.1\ \text{m}\right)$

$$+\circlearrowleft \Sigma M_E = 0$$

$$F'h - We = 0$$

$$h = \frac{We}{F'} = \frac{(60)(0.1)}{5.474}$$

$h = 1.096\ \text{m}$ ◀

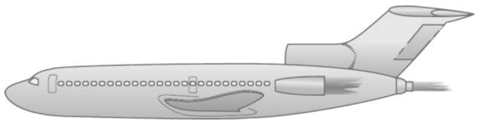
PROBLEM 14.75



A jet airliner is cruising at a speed of 900 km/h with each of its three engines discharging air with a velocity of 800 m/s relative to the plane. Determine the speed of the airliner after it has lost the use of (*a*) one of its engines, (*b*) two of its engines. Assume that the drag due to air friction is proportional to the square of the speed and that the remaining engines keep operating at the same rate.

SOLUTION

Let v be the airliner speed and u be the discharge relative velocity.

$$u = 800 \text{ m/s.}$$

Thrust formula for one engine: $F = \dfrac{dm}{dt}(u - v)$

Drag formula: $D = kv^2$

Three engines working. Cruising speed $= v_0 = 900$ km/h $= 250$ m/s

$$3F - D = 3\frac{dm}{dt}(u - v_0) - kv_0^2 = 0$$

$$\frac{dm}{dt} = \frac{kv_0^2}{3(u - v_0)} = \frac{k(250)^2}{3(800 - 250)} = 37.879k$$

(*a*) *One engine fails*. Two engines working. Cruising speed $= v_1$

$$2F - D = 2\frac{dm}{dt}(u - v_1) - kv_1^2 = 0$$

$$(2)(37.879k)(800 - v_1) - kv_1^2 = 0$$

$$v_1^2 + 75.758v_1 - 60.606\times10^3 = 0$$

$v_1 = 211.20$ m/s $\qquad v_1 = 760$ km/h ◀

(*b*) *Two engines fail*. One engine working. Cruising speed $= v_2$

$$F - D = \frac{dm}{dt}(u - v_2) - kv_2^2 = 0$$

$$(37.879k)(800 - v_2) - kv_2^2 = 0$$

$$v_2^2 + 37.879v_2 - 30.303\times10^3 = 0$$

$v_2 = 156.17$ m/s $\qquad v_2 = 562$ km/h ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.76

A 16-Mg jet airplane maintains a constant speed of 774 km/h while climbing at an angle $\alpha = 18°$. The airplane scoops in air at a rate of 300 kg/s and discharges it with a velocity of 665 m/s relative to the airplane. If the pilot changes to a horizontal flight while maintaining the same engine setting, determine (*a*) the initial acceleration of the plane, (*b*) the maximum horizontal speed that will be attained. Assume that the drag due to air friction is proportional to the square of the speed.

SOLUTION

Calculate the propulsive force using velocities relative to the airplane.

$$F = \frac{dm}{dt}(v_B - v_A)$$

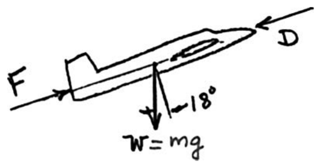
Data:

$$\frac{dm}{dt} = 300 \text{ kg/s}$$

$$v_A = 774 \text{ km/h} = 215 \text{ m/s}$$

$$v_B = 665 \text{ m/s}$$

$$F = (300)(665 - 215) = 135,000 \text{ N}$$



Since there is no acceleration while the airplane is climbing, the forces are in equilibrium.

$$+\measuredangle 18° \Sigma F = 0: \quad F - D - mg\sin\alpha = 0$$

$$F - D = mg\sin\alpha = (16,000)(9.8)\sin 18° = 48,454 \text{ N}$$

(*a*) *Initial acceleration of airplane in horizontal flight*:

$$ma = F - D: \quad 16,000a = 48.454\times 10^3$$

$\mathbf{a} = 3.03 \text{ m/s}^2 \measuredangle 18°$ ◀

Corresponding drag force:

$$D = 135,000 - 48,454 = 86,546 \text{ N}$$

Drag force factor:

$$D = kv_A^2$$

or

$$k = \frac{D}{v_A^2} = \frac{86,546}{(215)^2} = 1.87228 \text{ N}\cdot\text{s}^2/\text{m}^2$$

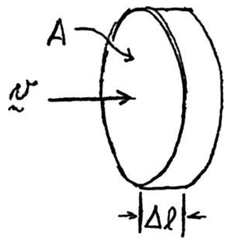
PROBLEM 14.77

The propeller of a small airplane has a 2-m-diameter slipstream and produces a thrust of 3600 N when the airplane is at rest on the ground. Assuming $\rho = 1.225 \text{ kg/m}^3$ for air, determine (*a*) the speed of the air in the slipstream, (*b*) the volume of air passing through the propeller per second, (*c*) the kinetic energy imparted per second to the air in the slipstream.

SOLUTION

Calculation of $\frac{dm}{dt}$ at a section in the airstream:



$$\text{mass} = \text{density} \times \text{volume}$$
$$= \text{density} \times \text{area} \times \text{length}$$
$$\Delta m = \rho A(\Delta l) = \rho A v \,\Delta t$$
$$\frac{\Delta m}{\Delta t} = \frac{dm}{dt} = \rho A v$$

(*a*) Thrust $= \frac{dm}{dt}(\mathbf{v}_B - \mathbf{v}_A)$ where $\mathbf{v}_B$ is the velocity just downstream of propeller and $\mathbf{v}_A$ is the velocity far upstream. Assume $\mathbf{v}_A$ is negligible.

$$\text{Thrust} = (\rho A v)v = \rho\left(\frac{\pi}{4}D^2\right)v^2$$
$$3600 = 1.225\left(\frac{\pi}{4}\right)(2)^2 v^2$$
$$v^2 = 935.44$$
$$v = 30.585 \text{ m/s}$$

$v = 30.6 \text{ m/s}$ ◀

(*b*) $$Q = \frac{1}{\rho}\frac{dm}{dt} = Av = \left(\frac{\pi}{4}D^2\right)v = \frac{\pi}{4}(2)^2(30.585) = 96.086$$

$Q = 96.1 \text{ m}^3/\text{s}$ ◀

(*c*) Kinetic energy of mass Δm:

$$\Delta T = \frac{1}{2}(\Delta m)v^2 = \frac{1}{2}\rho A(\Delta l)v^2 = \frac{1}{2}\rho A v(\Delta t)v^3$$
$$\frac{\Delta T}{\Delta t} = \frac{dT}{dt}$$
$$= \frac{1}{2}\rho A v^3$$
$$= \frac{1}{2}\rho\left(\frac{\pi}{4}D^2\right)v^3$$
$$= \frac{1}{2}(1.225)\left(\frac{\pi}{4}\right)(2)^2(30.585)^3$$
$$= 55{,}053 \text{ N}\cdot\text{m/s}$$

$\frac{dT}{dt} = 55{,}100 \text{ N}\cdot\text{m/s}$ ◀

PROBLEM 14.78

The wind turbine-generator shown has an output-power rating of 1.5 MW for a wind speed of 36 km/h. For the given wind speed, determine (*a*) the kinetic energy of the air particles entering the 82.5-m-diameter circle per second, (*b*) the efficiency of this energy conversion system. Assume $\rho = 1.21\ \text{kg/m}^3$ for air.

SOLUTION

(*a*) Rate of kinetic energy in the slipstream.

Let Δm be the mass moving through the slipstream of area A in the time Δt. Then,

$$\Delta m = \rho A(\Delta l) = \rho A v(\Delta t)$$

The kinetic energy carried by this mass is

$$\Delta t = \frac{1}{2}(\Delta m)v^2 = \frac{1}{2}\rho A v^3(\Delta t)$$

$$\frac{dT}{dt} = \frac{\Delta T}{\Delta t} = \frac{1}{2}\rho A v^3$$

Data:

$$A = \frac{\pi}{4}d^2 = \frac{\pi}{4}(82.5\ \text{m})^2 = 5345.6\ \text{m}^2$$

$$v = 36\ \text{km/h} = 10\ \text{m/s}$$

$$\frac{dT}{dt} = \frac{1}{2}(1.21\ \text{kg/m}^3)(5345.6\ \text{m}^2)(10\ \text{m/s})^3$$

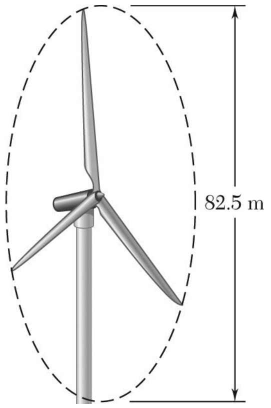
$$= 3.234 \times 10^6\ \text{kg} \cdot \text{m}^2/\text{s}^3$$

$$\frac{dT}{dt} = 3.234\ \text{MW} \blacktriangleleft$$

(*b*) Efficiency *n*:

$$\eta = \frac{\text{output power}}{\text{available input power}} = \frac{1.5\ \text{MW}}{3.234\ \text{MW}} \qquad \eta = 0.464 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 14.79

A wind turbine-generator system having a diameter of 82.5 m produces 1.5 MW at a wind speed of 12 m/s. Determine the diameter of blade necessary to produce 10 MW of power assuming the efficiency is the same for both designs and $\rho = 1.21\ \text{kg/m}^3$ for air.

SOLUTION

Rate of kinetic energy in the slipstream.

Let Δm be the mass moving through the slipstream of area A in time Δt. Then

$$\Delta m = \rho A(\Delta l) = \rho A v(\Delta t)$$

The kinetic energy carried by this mass is

$$\Delta T = \frac{1}{2}(\Delta m)v^2 = \frac{1}{2}\rho A v^3(\Delta t)$$

$$\frac{dT}{dt} = \frac{\Delta T}{\Delta t} = \frac{1}{2}\rho A v^3$$

This is the available input power for the wind turbine. For a wind turbine of efficiency η, the output power P is

$$P = \eta\frac{dT}{dt} = \frac{\eta}{2}\rho A v^3$$

We want to compare two turbines having $P_1 = 1.5\ \text{MW}$ and $P_2 = 10\ \text{MW}$, respectively. Then

$$\frac{P_2}{P_1} = \frac{\eta_2 \rho_2 A_2 v_2^3}{\eta_1 \rho_1 A_1 v_1^3}$$

Since $\eta_2 = \eta_1$, $\rho_2 = \rho_1$, and $v_2 = v_1$, we get

$$\frac{P_2}{P_1} = \frac{A_2}{A_1} = \frac{d_2^2}{d_1^2} = \frac{10}{1.5} = 6.6667$$

$$d_2^2 = 6.6667 d_1^2 = (6.6667)(82.5\ \text{in})^2$$

$d_2 = 213\ \text{m}$ ◀

PROBLEM 14.80

While cruising in level flight at a speed of 570 mi/h, a jet airplane scoops in air at a rate of 240 lb/s and discharges it with a velocity of 2200 ft/s relative to the airplane. Determine (*a*) the power actually used to propel the airplane, (*b*) the total power developed by the engine, (*c*) the mechanical efficiency of the airplane.

SOLUTION

Data:

$$\frac{dm}{dt} = \frac{240}{32.2} = 7.4534 \text{ slugs/s}$$

$$u = 2200 \text{ ft/s}$$

$$v = 570 \text{ mi/h} = 836 \text{ ft/s}$$

$$F = \frac{dm}{dt}(u - v)$$

$$= (7.4534)(2200 - 836)$$

$$= 10{,}166 \text{ lb}$$

(*a*) Power used to propel airplane:

$$P_1 = Fv$$

$$= (10{,}166)(836)$$

$$= 8.499 \times 10^6 \text{ ft} \cdot \text{lb/s}$$

Propulsion power $= 15{,}450$ hp ◀

Power of kinetic energy of exhaust:

$$P_2(\Delta t) = \frac{1}{2}(\Delta m)(u - v)^2$$

$$P_2 = \frac{1}{2}\frac{dm}{dt}(u - v)^2$$

$$= \frac{1}{2}(7.4534)(2200 - 836)^2$$

$$= 6.934 \times 10^6 \text{ ft} \cdot \text{lb/s}$$

(*b*) Total power:

$$P = P_1 + P_2$$

$$= 15.433 \times 10^6 \text{ ft} \cdot \text{lb/s}$$

Total power $= 28{,}060$ hp ◀

(*c*) Mechanical efficiency:

$$\frac{P_1}{P} = \frac{8.499 \times 10^6}{15.433 \times 10^6}$$

$$= 0.551$$

Mechanical efficiency $= 0.551$ ◀

PROBLEM 14.81

In a Pelton-wheel turbine, a stream of water is deflected by a series of blades so that the rate at which water is deflected by the blades is equal to the rate at which water issues from the nozzle $(\Delta m/\Delta t = A\rho v_A)$. Using the same notation as in Sample Problem 14.7, (*a*) determine the velocity **V** of the blades for which maximum power is developed, (*b*) derive an expression for the maximum power, (*c*) derive an expression for the mechanical efficiency.

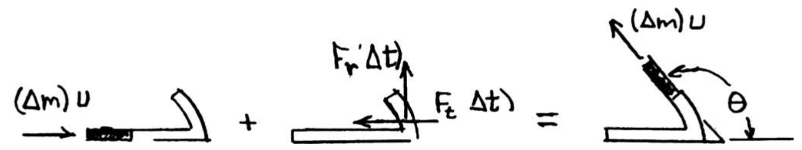
SOLUTION

Let **u** be the velocity of the stream relative to the velocity of the blade.

$$u = (v - V)$$

Mass flow rate:

$$\frac{\Delta m}{\Delta t} = \rho A v_A$$



Principle of impulse and momentum:

$$\xrightarrow{+} (\Delta m)u - F_t(\Delta t) = (\Delta m)u \cos\theta$$

$$F_t = \frac{\Delta m}{\Delta t} u(1 - \cos\theta)$$

$$= \rho A v_A (v_A - V)(1 - \cos\theta)$$

where F_t is the tangential force on the fluid.

The force F_t on the fluid is directed to the left as shown. By Newton's law of action and reaction, the tangential force on the blade is F_t to the right.

Output power:

$$P_{\text{out}} = F_t V$$

$$= \rho A v_A (v_A - V) V (1 - \cos\theta)$$

(*a*) V for maximum power output:

$$\frac{dP_{\text{out}}}{dV} = \rho A (v_A - 2V)(1 - \cos\theta) = 0$$

$$v_A = \frac{1}{2} V \blacktriangleleft$$

(*b*) Maximum power:

$$(P_{\text{out}})_{\max} = \rho A v_A \left(v_A - \frac{1}{2} v_A \right) \left(\frac{1}{2} v_A \right) (1 - \cos\theta)$$

$$(P_{\text{out}})_{\max} = \frac{1}{4} \rho A v_A^3 (1 - \cos\theta) \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.82

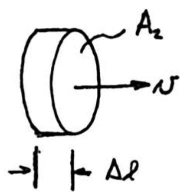
A circular reentrant orifice (also called Borda's mouthpiece) of diameter D is placed at a depth h below the surface of a tank. Knowing that the speed of the issuing stream is $v = \sqrt{2gh}$ and assuming that the speed of approach v_1 is zero, show that the diameter of the stream is $d = D/\sqrt{2}$. (*Hint*: Consider the section of water indicated, and note that P is equal to the pressure at a depth h multiplied by the area of the orifice).

SOLUTION

From hydrostatics, the pressure at section 1 is $p_1 = \gamma h = \rho g h.$

The pressure at section 2 is $p_2 = 0.$

Calculate the mass flow rate using section 2.



$$\text{mass} = \text{density} \times \text{volume}$$
$$= \text{density} \times \text{area} \times \text{length}$$
$$\Delta m = \rho A_2 (\Delta l) = \rho A_2 v (\Delta t)$$
$$\frac{dm}{dt} = \frac{\Delta m}{\Delta t} = \rho A_2 v$$

Apply the impulse-momentum principle to fluid between sections 1 and 2.

$$(\Delta m) v_1 + p_1 A_1 (\Delta t) = (\Delta m) v$$
$$\frac{dm}{dt} v_1 + p_1 A_1 = \frac{dm}{dt} v$$
$$p_1 A_1 = \frac{dm}{dt}(v - v_1)$$
$$= \rho A_2 v (v - v_1)$$

But v_1 is negligible, $\quad p_1 = \rho g h \quad \text{and} \quad v = \sqrt{2gh}$

$$\rho g h A_1 = \rho A_2 (2gh) \quad \text{or} \quad A_1 = 2A_2$$

$$\frac{\pi}{4} D^2 = 2\left(\frac{\pi}{4} d^2\right)$$

$$d = \frac{D}{\sqrt{2}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.83

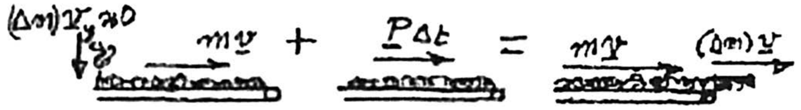
Gravel falls with practically zero velocity onto a conveyor belt at the constant rate $q = dm/dt$. (*a*) Determine the magnitude of the force **P** required to maintain a constant belt speed v. (*b*) Show that the kinetic energy acquired by the gravel in a given time interval is equal to half the work done in that interval by the force **P**. Explain what happens to the other half of the work done by **P**.

SOLUTION

(*a*) We apply the impulse-momentum principle to the gravel on the belt and to the mass Δm of gravel hitting and leaving belt in interval Δt.



$\xrightarrow{+}$ x comp.: $mv + P\Delta t = mv + (\Delta m)v$

$$P = \frac{\Delta m}{\Delta t} v = qv \qquad P = qv \blacktriangleleft$$

(*b*) Kinetic energy acquired for unit time:

$$\Delta T = \frac{1}{2}(\Delta m)v^2$$

$$\frac{\Delta T}{\Delta t} = \frac{1}{2}\frac{\Delta m}{\Delta t}v^2 = \frac{1}{2}qv^2 \qquad (1)$$

Work done per unit time:

$$\frac{\Delta U}{\Delta t} = \frac{P\Delta x}{\Delta t} = Pv$$

Recalling the result of part *a*:

$$\Delta U = P(\Delta x)$$

$$\frac{\Delta U}{\Delta t} = (qv)v = qv^2 \qquad (2)$$

Comparing Eqs. (1) and (2), we conclude that

$$\frac{\Delta T}{\Delta t} = \frac{1}{2}\frac{\Delta U}{\Delta t} \qquad \text{Q.E.D.} \quad \blacktriangleleft$$

The other half of the work of **P** is dissipated into heat by friction as the gravel slips on the belt before reaching the speed v. ◀

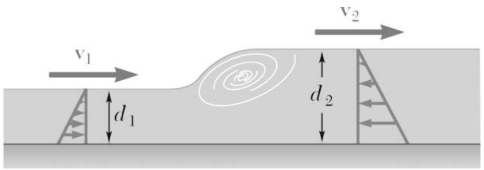
PROBLEM 14.84*

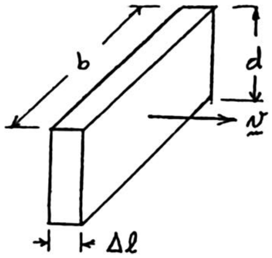


The depth of water flowing in a rectangular channel of width b at a speed v_1 and a depth d_1 increases to a depth d_2 at a *hydraulic jump*. Express the rate of flow Q in terms of b, d_1, and d_2.

SOLUTION

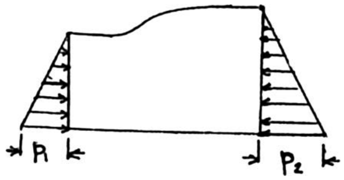
Mass flow rate:

$$\text{mass} = \text{density} \times \text{volume}$$
$$= \text{density} \times \text{area} \times \text{length}$$
$$\Delta m = \rho b d(\Delta l) = \rho b d v(\Delta t)$$
$$\frac{dm}{dt} = \frac{\Delta m}{\Delta t} = \rho b d v$$
$$Q = \frac{1}{\rho}\frac{dm}{dt} = bdv$$



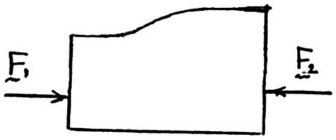
Continuity of flow:

$$Q_1 = Q_2 = Q$$
$$v_1 = \frac{Q}{bd_1} \qquad v_2 \frac{Q}{bd_2}$$

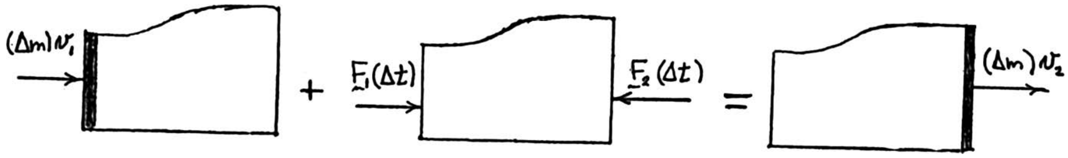


Resultant pressure forces:

$$p_1 = \gamma d_1 \qquad p_2 = \gamma d_2$$
$$F_1 = \frac{1}{2} p_1 b d_1 = \frac{1}{2}\gamma b d_1^2$$
$$F_2 = \frac{1}{2} p_2 b d_2 = \frac{1}{2}\gamma b d_2^2$$



Apply impulse-momentum principle to water between sections 1 and 2.



$$(\Delta m)v_1 + F_1(\Delta t) - F_2(\Delta t) = (\Delta m)v_2$$

$$\frac{\Delta m}{\Delta t}(v_1 - v_2) = F_2 - F_1 \quad \rho Q \cdot \left(\frac{Q}{bd_1} - \frac{Q}{bd_2}\right) = \frac{1}{2}\gamma b\left(d_2^2 - d_1^2\right)$$

$$\frac{\rho Q^2(d_2 - d_1)}{bd_1 d_2} = \frac{1}{2}\gamma b(d_1 + d_2)(d_2 - d_1)$$

Noting that $\gamma = \rho g$,
$$Q = b\sqrt{\frac{1}{2} g d_1 d_2 (d_1 + d_2)} \quad ◀$$

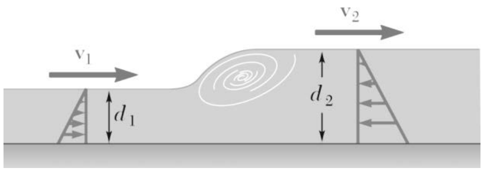
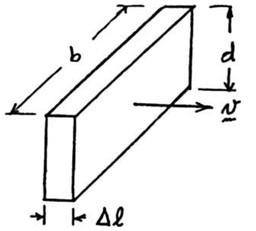
PROBLEM 14.85*



Determine the rate of flow in the channel of Problem 14.84, knowing that $b = 12$ ft, $d_1 = 4$ ft, and $d_2 = 5$ ft.

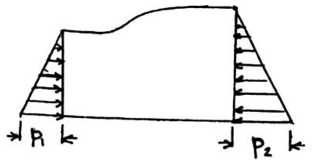
PROBLEM 14.84 The depth of water flowing in a rectangular channel of width b at a speed v_1 and a depth d_1 increases to a depth d_2 at a *hydraulic jump*. Express the rate of flow Q in terms of b, d_1, and d_2.

SOLUTION



Mass flow rate:

$$\text{mass} = \text{density} \times \text{volume}$$
$$= \text{density} \times \text{area} \times \text{length}$$
$$\Delta m = \rho bd(\Delta l) = \rho bdv(\Delta t)$$
$$\frac{dm}{dt} = \frac{\Delta m}{\Delta t} = \rho bdv$$
$$Q = \frac{1}{\rho}\frac{dm}{dt} = bdv$$

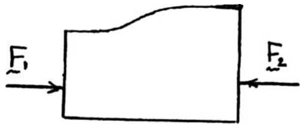


Continuity of flow:

$$Q_1 = Q_2 = Q$$
$$v_1 = \frac{Q}{bd_1} \qquad v_2 \frac{Q}{bd_2}$$

Resultant pressure forces:

$$p_1 = \gamma d_1 \qquad p_2 = \gamma d_2$$
$$F_1 = \frac{1}{2}p_1 bd_1 = \frac{1}{2}\gamma bd_1^2$$
$$F_2 = \frac{1}{2}p_2 bd_2 = \frac{1}{2}\gamma bd_2^2$$



Apply impulse-momentum principle to water between sections 1 and 2.

$$(\Delta m)v_1 + F_1(\Delta t) - F_2(\Delta t) = (\Delta m)v_2$$
$$\frac{\Delta m}{\Delta t}(v_1 - v_2) = F_2 - F_1 \qquad \rho Q \cdot \left(\frac{Q}{bd_1} - \frac{Q}{bd_2}\right) = \frac{1}{2}\gamma b\left(d_2^2 - d_1^2\right)$$
$$\frac{\rho Q^2(d_2 - d_1)}{bd_1 d_2} = \frac{1}{2}\gamma b(d_1 + d_2)(d_2 - d_1)$$

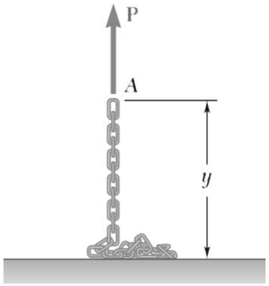
PROBLEM 14.86



A chain of length l and mass m lies in a pile on the floor. If its end A is raised vertically at a constant speed v, express in terms of the length y of chain which is off the floor at any given instant (*a*) the magnitude of the force **P** applied at A, (*b*) the reaction of the floor.

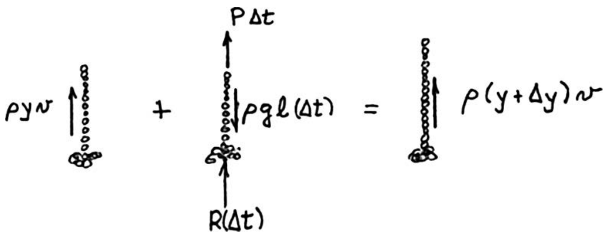
SOLUTION

Let ρ be the mass per unit length of chain. Apply the impulse-momentum to the entire chain. Assume that the reaction from the floor is equal to the weight of chain still in contact with the floor.

Calculate the floor reaction.

$$R = \rho g(l - y)$$

$$R = mg\left(1 - \frac{y}{l}\right)$$



Apply the impulse-momentum principle.

$$\rho yv + P(\Delta t) + R(\Delta t) - \rho gL(\Delta t) = \rho(y + \Delta y)v$$

$$P\Delta t = \rho(\Delta y)v + \rho gL(\Delta t) - R(\Delta t)$$

(*a*) $$P = \rho\frac{\Delta y}{\Delta t}v + \rho gL - \rho(L - y)g$$

$$= \rho v^2 + \rho gy \qquad P = \frac{m}{l}(v^2 + gy) \blacktriangleleft$$

Let $$\frac{\Delta y}{\Delta t} = \frac{dy}{dt} = v$$

(*b*) From above, $$\mathbf{R} = mg\left(1 - \frac{y}{l}\right)\uparrow \blacktriangleleft$$

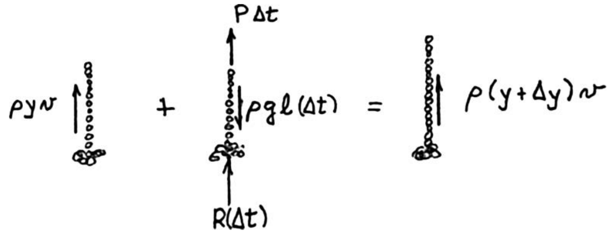
	**PROBLEM 14.87** Solve Problem 14.86, assuming that the chain is being *lowered* to the floor at a constant speed v. **PROBLEM 14.86** A chain of length l and mass m lies in a pile on the floor. If its end A is raised vertically at a constant speed v, express in terms of the length y of chain which is off the floor at any given instant (a) the magnitude of the force **P** applied at A, (b) the reaction of the floor.

SOLUTION

(a) Let ρ be the mass per unit length of chain. The force P supports the weight of chain still off the floor.

$$P = \rho g y \qquad\qquad P = \frac{mgy}{l} \blacktriangleleft$$

(b) Apply the impulse-momentum principle to the entire chain.



$$-\rho yv + P(\Delta t) + R(\Delta t) - \rho gL(\Delta t) = -\rho g(y + \Delta y)v$$

$$R(\Delta t) = \rho gL(\Delta t) - P(\Delta t) - \rho g(\Delta y)v$$

$$R = \rho gL - \rho gy - \rho\frac{\Delta y}{\Delta t}v$$

Let $\Delta t \to 0$. Then $\quad \dfrac{\Delta y}{\Delta t} = \dfrac{dy}{dt} = -v$

$$R = \rho g(L - y) + \rho v^2 \qquad\qquad \mathbf{R} = \frac{m}{l}[g(L - y) + v^2] \uparrow \blacktriangleleft$$

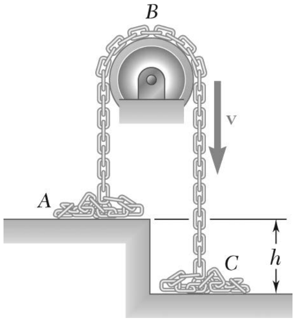
PROBLEM 14.88



The ends of a chain lie in piles at A and C. When released from rest at time $t = 0$, the chain moves over the pulley at B, which has a negligible mass. Denoting by L the length of chain connecting the two piles and neglecting friction, determine the speed v of the chain at time t.

SOLUTION

Let m be the mass of the portion of the chain between the two piles. This is the portion of the chain that is moving with speed v. The remainder of the chain lies in either of the two piles. Consider the time period between t and $t + \Delta t$ and apply the principle impulse and momentum. Let Δm be the amount of chain that is picket up at A and deposited at C during the time period Δt.

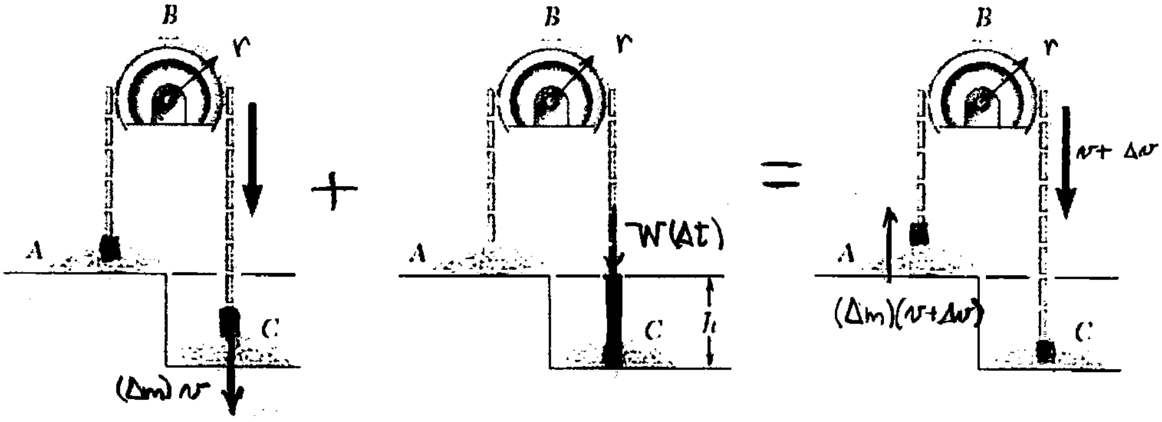
At time t, Δm is still in pile A while Δm has a downward at speed v just above pile C. The remaining mass $(m - \Delta m)$ is moving with speed v.

At time $t + \Delta t$, Δm is moving with speed $v + \Delta v$ just above pile A and Δm is at rest in pile C.

Over the time period an unbalanced weight of chain acts on the system. The weight is

$$W = \frac{mgh}{L}$$

Apply the impulse-momentum principle to the system.



Consider moments about the pulley axle.

$$r[(\Delta m)v + (m - \Delta m)v] + rW(\Delta t)$$
$$= r[(\Delta m)(v + \Delta v) + (m - \Delta m)(v + \Delta v)]$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.88 (Continued)

Dividing by r and canceling the terms $(\Delta m)v$ and $(m-\Delta m)v$

$$0+\frac{mgh}{L}(\Delta t)=(\Delta m)(v+\Delta v)+(m-\Delta m)(\Delta v)$$
$$=v(\Delta m)+m(\Delta v)$$

But $$\Delta m=\frac{m}{L}v(\Delta t)$$

Hence, $$\frac{mgh}{L}(\Delta t)=\frac{mv^2}{L}(\Delta t)+m(\Delta v)$$

Solving for Δt, $$\Delta t=\frac{L(\Delta v)}{gh-v^2}$$

Letting $c^2=gh,$ and considering the limit as Δt and Δv become infinitesimal, gives

$$dt=\frac{L\,dv}{c^2-v^2}$$

Integrate, noting that $v=0$ when $t=0$

$$t=L\int_0^v\frac{dv}{c^2-v^2}=\frac{L}{c}\tanh^{-1}\frac{v}{c}\bigg|_0^v$$

$$\tanh\frac{ct}{L}=\frac{v}{c}$$

$$v=\sqrt{gh}\tanh\left(\frac{\sqrt{gh}}{L}t\right) \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.89

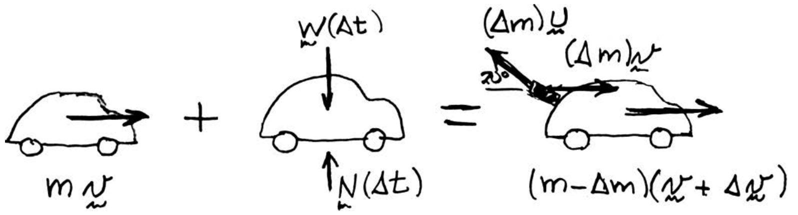
A toy car is propelled by water that squirts from an internal tank at a constant 6 ft/s relative to the car. The weight of the empty car is 0.4 lb and it holds 2 lb of water. Neglecting other tangential forces, determine the top speed of the car.

SOLUTION

Consider a time interval Δt. Let m be the mass of the car plus the water in the tank at the beginning of the interval and $(m - \Delta m)$ the corresponding mass at the end of the interval. m_0 is the initial value of m. Let **v** be the velocity of the car. Apply the impulse and momentum principle over the time interval.



Horizontal components $\xrightarrow{+}$:

$$mv + 0 = (\Delta m)(\not{v} - u\cos 20°) + (\not{m} - \Delta m)(\not{v} + \Delta v)$$

$$\Delta v = u\cos 20° \frac{\Delta m}{m - \Delta m}$$

Let Δv be replaced by differential dv and Δm be replaced by the small differential $-dm$, the minus sign meaning that dm is the infinitesimal increase in m.

$$dv = -u\cos 20° \frac{dm}{m}$$

Integrating, $$v = v_0 - u\cos 20° \ln\frac{m}{m_0}$$

Since $v_0 = 0$, $$v = u\cos 20° \ln\frac{m_0}{m}$$

The velocity is maximum when $m = m_f$, the value of m when all of the water is expelled.

$$v_{\max} = u\cos 20° \ln\frac{m_0}{m_f}$$

$$v_{\max} = (6\text{ ft/s})\cos 20° \ln\frac{0.4+2}{0.4}$$

$v_{\max} = 10.10$ ft/s ◀

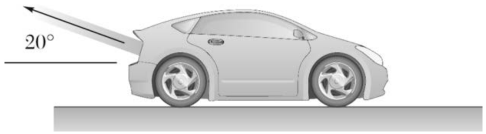
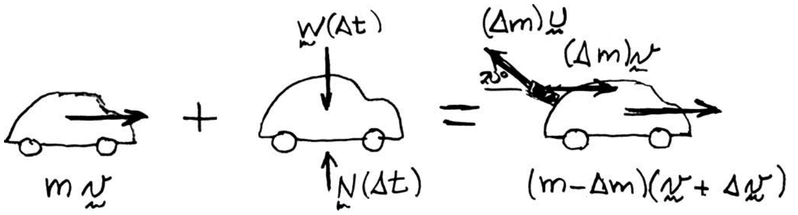
PROBLEM 14.90



A toy car is propelled by water that squirts from an internal tank. The weight of the empty car is 0.4 lb and it holds 2 lb of water. Knowing the top speed of the car is 8 ft/s, determine the relative velocity of the water that is being ejected.

SOLUTION

Consider a time interval Δt. Let m be the mass of the car plus the water in the tank at the beginning of the interval and $(m - \Delta m)$ the corresponding mass at the end of the interval. m_0 is the initial value of m. Let **v** be the velocity of the car. Apply the impulse and momentum principle over the time interval.



Horizontal components $\xrightarrow{+}$:

$$mv + 0 = (\Delta m)(\cancel{v} - u\cos 20°) + (\cancel{m} - \Delta m)(\cancel{v} + \Delta v)$$

$$\Delta v = u\cos 20° \frac{\Delta m}{m - \Delta m}$$

Let Δv be replaced by differential dv and Δm be replaced by the small differential $-dm$, the minus sign meaning that dm is the infinitesimal increase in m.

$$dv = -u\cos 20° \frac{dm}{m}$$

Integrating, $$v = v_0 - u\cos 20° \ln\frac{m}{m_0}$$

Since $v_0 = 0$, $$v = u\cos 20° \ln\frac{m_0}{m}$$

The velocity is maximum when $m = m_f$, the value of m when all of the water is expelled.

$$v_{max} = u\cos 20° \ln\frac{m_0}{m_f}$$

$$8 \text{ ft/s} = u\cos 20° \ln\frac{0.4 + 2}{0.4}$$

$u = 4.75$ ft/s ◀

PROBLEM 14.93

A rocket weighs 2600 lb, including 2200 lb of fuel, which is consumed at the rate of 25 lb/s and ejected with a relative velocity of 13000 ft/s. Knowing that the rocket is fired vertically from the ground, determine its acceleration (*a*) as it is fired, (*b*) as the last particle of fuel is being consumed.

SOLUTION

From Eq. (14.44) of the textbook, the thrust is

$$P = \frac{dm}{dt}u$$

$$= \frac{(25 \text{ lb/s})}{32.2 \text{ ft/s}^2}(13000 \text{ ft/s})$$

$$= 10.093 \times 10^3 \text{ lb}$$

$$\Sigma F = ma$$

$$P - mg = ma \qquad a = \frac{P}{m} - g \qquad (1)$$

(*a*) *At the start of firing,* $W = W_0 = 2600$ lb

$$g = 32.2 \text{ ft/s}^2 \qquad m = \frac{2600}{32.2} = 80.745 \text{ slug}$$

From Eq. (1), $a = \frac{10.093 \times 10^3 \text{ lb}}{80.745 \text{ slug}} - 32.2 = 92.80 \text{ ft/s}^2$ $\qquad \mathbf{a} = 92.8 \text{ ft/s}^2 \uparrow$ ◀

(*b*) *As the last particle of fuel is consumed,*

$$W = 2600 - 2200 = 400 \text{ lb}$$

$$g = 32.2 \text{ ft/s}^2 \text{ (assumed)} \qquad m = \frac{400}{32.2} = 12.422 \text{ slug}$$

From Eq. (1), $a = \frac{10.093 \times 10^3 \text{ lb}}{12.422} - 32.2 = 780.30 \text{ ft/s}^2$ $\qquad \mathbf{a} = 780 \text{ ft/s}^2 \uparrow$ ◀

PROBLEM 14.94

A space vehicle describing a circular orbit at a speed of 24×10^3 km/h releases its front end, a capsule which has a gross mass of 600 kg, including 400 kg of fuel. If the fuel is consumed at the rate of 18 kg/s and ejected with a relative velocity of 3000 m/s, determine (*a*) the tangential acceleration of the capsule as the engine is fired, (*b*) the maximum speed attained by the capsule.

SOLUTION

Thrust:

$$P = \left|\frac{dm}{dt}\right| u$$

$$= (18 \text{ kg/s})(3000 \text{ m/s})$$

$$= 54\times10^3 \text{ N}$$

(*a*)

$$(a_t)_0 = \frac{P}{m_0} = \frac{54\times10^3}{600} = 90 \text{ m/s}^2$$

$(a_t)_0 = 90.0 \text{ m/s}^2$ ◀

(*b*) Maximum speed is attained when all the fuel is used up:

$$v_1 = v_0 + \int_0^{t_1} a_t dt = v_0 + \int_0^{t_1} \frac{P}{m} dt$$

$$= v_0 + \int_0^{t_1} \frac{u\left(\frac{dm}{dt}\right)}{m} dt = v_0 + u\int_{m_0}^{m_1}\left(-\frac{dm}{m}\right)$$

$$v_1 = v_0 + u\left(-\ln\frac{m_1}{m_0}\right) = v_0 + u\ln\frac{m_0}{m_1}$$

Data:

$$v_0 = 24\times10^3 \text{ km/h}$$

$$= 6.6667\times10^3 \text{ m/s}$$

$$u = 3000 \text{ m/s}$$

$$m_0 = 600 \text{ kg}$$

$$m_1 = 600 - 400 = 200 \text{ kg}$$

$$v_1 = 6.6667\times10^3 + 3000\ln\frac{600}{200}$$

$$= 9.9625\times10^3 \text{ m/s}$$

$v_1 = 35.9\times10^3$ km/h ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.95

A 540-kg spacecraft is mounted on top of a rocket with a mass of 19 Mg, including 17.8 Mg of fuel. Knowing that the fuel is consumed at a rate of 225 kg/s and ejected with a relative velocity of 3600 m/s, determine the maximum speed imparted to the spacecraft if the rocket is fired vertically from the ground.

SOLUTION

See sample Problem 14.8 for derivation of

$$v = u \ln \frac{m_0}{m_0 - qt} - gt \qquad (1)$$

Data:

$$u = 3600 \text{ m/s} \quad q = 225 \text{ kg/s}, \quad m_{\text{fuel}} = 17{,}800 \text{ kg}$$

$$m_0 = 19{,}000 \text{ kg} + 540 \text{ kg} = 19{,}540 \text{ kg}$$

We have

$$m_{\text{fuel}} = qt, \quad 17{,}800 \text{ kg} = (225 \text{ kg/s})t$$

$$t = \frac{17{,}800 \text{ kg}}{225 \text{ kg/s}} = 79.111 \text{ s}$$

Maximum velocity is reached when all fuel has been consumed, that is, when $qt = m_{\text{fuel}}$. Eq. (1) yields

$$v_m = u \ln \frac{m_0}{m_0 - m_{\text{fuel}}} - gt$$

$$= (3600 \text{ m/s}) \ln \frac{19{,}540}{19{,}540 - 17{,}800} - (9.81 \text{ m/s}^2)(79.111 \text{ s})$$

$$= (3600 \text{ m/s}) \ln 11.230 - 776.1 \text{ m/s}$$

$$= 7930.8 \text{ m/s}$$

$v_m = 7930$ m/s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 14.96

The rocket used to launch the 540-kg spacecraft of Problem 14.95 is redesigned to include two stages *A* and *B*, each of mass 9.5 Mg, including 8.9 Mg of fuel. The fuel is again consumed at a rate of 225 kg/s and ejected with a relative velocity of 3600 m/s. Knowing that when stage *A* expels its last particle of fuel its casing is released and jettisoned, determine (*a*) the speed of the rocket at that instant, (*b*) the maximum speed imparted to the spacecraft.

SOLUTION

Thrust force: $P = u\dfrac{dm}{dt} = uq$

Mass of rocket + unspent fuel: $m = m_0 - qt$

Corresponding weight force: $W = mg$

Acceleration: $a = \dfrac{F}{m} = \dfrac{P-W}{m} = \dfrac{P}{m} - g = \dfrac{uq}{m_0 - qt} - g$

Integrating with respect to time to obtain the velocity,

$$v = v_0 + \int_0^t a\,dt = v_0 + u\int_0^t \frac{q\,dt}{m_0 - qt} - gt$$

$$= v_0 - u\ln\frac{m_0 - qt}{m_0} - gt \qquad (1)$$

For each stage, $m_{\text{fuel}} = 8900$ kg $\quad u = 3600$ m/s

$$q = 225 \text{ kg/s} \qquad t = \frac{m_{\text{fuel}}}{q} = \frac{8900}{225} = 39.556 \text{ s}$$

For the first stage, $v_0 = 0 \qquad m_0 = 540 + (2)(9500) = 19{,}540$ kg

(*a*) $$v_1 = 0 - 3600\ln\frac{19{,}540 - 8900}{19{,}540} - (9.81)(39.556) = 1800.1 \text{ m/s}$$

$v_1 = 1800$ m/s ◀

For the second stage, $v_0 = 1800.1$ m/s, $\quad m_0 = 540 + 9500 = 10{,}040$ kg

(*b*) $$v_2 = 1800.1 - 3600\ln\frac{10{,}040 - 8900}{10{,}040} - (9.81)(39.556) = 9244 \text{ m/s}$$

$v_2 = 9240$ m/s ◀

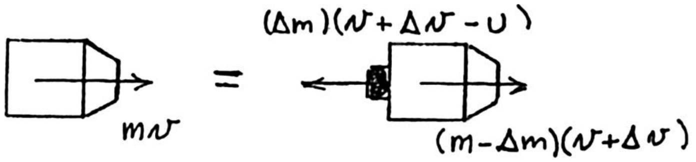
PROBLEM 14.99

Determine the distance separating the communication satellite of Problem 14.97 from the space shuttle 60 s after its engine has been fired, knowing that the fuel is consumed at a rate of 37.5 lb/s.

PROBLEM 14.97 A communication satellite weighing 10,000 lb, including fuel, has been ejected from a space shuttle describing a low circular orbit around the earth. After the satellite has slowly drifted to a safe distance from the shuttle, its engine is fired to increase its velocity by 8000 ft/s as a first step to its transfer to a geosynchronous orbit. Knowing that the fuel is ejected with a relative velocity of 13,750 ft/s, determine the weight of fuel consumed in this maneuver.

SOLUTION

Apply the *principle of impulse and momentum* to the satellite plus the fuel expelled in time Δt.



$$\xrightarrow{+}: \quad mv = (m-\Delta m)(v+\Delta v) + (\Delta m)(v+\Delta v - v)$$

$$= mv + m(\Delta v) - (\Delta m)v - (\Delta m)(\Delta v)$$

$$+ (\Delta m)v + (\Delta m)(\Delta v) - (\Delta m)v$$

$$m(\Delta v) - u(\Delta m) = 0$$

$$\Delta m = -\frac{dm}{dt}(\Delta t)$$

$$\frac{\Delta v}{\Delta t} = \frac{dv}{dt} = -\frac{u}{m}\frac{dm}{dt} = -\frac{uq}{m} = -\frac{uq}{m_0 - qt}$$

$$v = v_0 + \int_0^t \frac{uq}{m_0 - qt}\,dt = v_0 - u\ln(m_0 - qt)\Big|_0^t$$

$$= v_0 + u\ln(m_0 - qt) + u\ln m_0$$

$$= v_0 - u\ln\left(\frac{m_0 - qt}{m_0}\right) \qquad (1)$$

Set $\frac{dx}{dt} = v$ in Eq. (1) and integrate with respect to time.

$$x = x_0 + v_0 t + u\int_0^t \ln\left(\frac{m_0 - qt}{m_0}\right)dt$$

PROBLEM 14.100

For the rocket of Problem 14.93, determine (*a*) the altitude at which all the fuel has been consumed, (*b*) the velocity of the rocket at that time.

PROBLEM 14.93 A rocket weighs 2600 lb, including 2200 lb of fuel, which is consumed at the rate of 25 lb/s and ejected with a relative velocity of 13000 ft/s. Knowing that the rocket is fired vertically from the ground, determine its acceleration (*a*) as it is fired, (*b*) as the last particle of fuel is being consumed.

SOLUTION

See Sample Problem 14.8 for derivation of

$$v = u\ln\frac{m_0}{m_0 - qt} - gt = -u\ln\frac{m_0 - qt}{m_0} - gt \qquad (1)$$

Note that g is assumed to be constant.

Set $\frac{dy}{dt} = v$ in Eq. (1) and integrate with respect to time.

$$h = \int_0^h dy = \int_0^t v\,dt = \int_0^t \left(u\ln\frac{m_0}{m_0 - qt} - gt \right) dt$$

$$= -u\int_0^t \ln\frac{m_0 - qt}{m_0}\,dt - \frac{1}{2}gt^2$$

Let $\quad z = \dfrac{m_0 - qt}{m_0} \qquad dz = -\dfrac{q}{m_0}dt \qquad$ or $\qquad dt = -\dfrac{m_0}{q}dz$

$$h = \frac{m_0 u}{q}\int_{z_0}^{z} \ln z\,dz - \frac{1}{2}gt^2 = \frac{m_0 u}{q}[(z\ln z + z)]_{z_0}^{z} - \frac{1}{2}gt^2$$

$$= \frac{m_0 u}{q}\left[\frac{m_0 - qt}{m_0}\left(\ln\frac{m_0 - qt}{m_0} - 1 \right) - \frac{m_0}{m_0}\left(\ln\frac{m_0}{m_0} - 1 \right) \right] - \frac{1}{2}gt^2$$

$$= \frac{m_0 u}{q}\left[\left(1 - \frac{qt}{m_0} \right)\left(\ln\frac{m_0 - qt}{m_0} - 1 \right) + 1 \right] - \frac{1}{2}gt^2$$

$$= \frac{m_0 u}{q}\left[\ln\frac{m_0 - qt}{m_0} - 1 + 1 \right] - ut\left[\ln\frac{m_0 - qt}{m_0} - 1 \right] - \frac{1}{2}gt^2$$

$$= ut + \left(\frac{m_0 u}{q} - ut \right)\ln\frac{m_0 - qt}{m_0} - \frac{1}{2}gt^2$$

$$h = u\left[t - \left(\frac{m_0}{q} - t \right)\ln\frac{m_0}{m_0 - qt} \right] - \frac{1}{2}gt^2 \qquad (2)$$

PROBLEM 14.102

For the spacecraft and the two-stage launching rocket of Problem 14.96, determine the altitude at which (*a*) stage *A* of the rocket is released, (*b*) the fuel of both stages has been consumed.

SOLUTION

Thrust force: $$P = u\frac{dm}{dt} = uq$$

Mass of rocket + unspent fuel: $$m = m_0 - qt$$

Corresponding weight force: $$W = mg$$

Acceleration: $$a = \frac{F}{m} = \frac{P-W}{m} = \frac{P}{m} - g = \frac{uq}{m_0 - qt} - g$$

Integrating with respect to time to obtain velocity,

$$v = v_0 + \int_0^t a\,dt = v_0 + u\int_0^t \frac{q\,dt}{m_0 - qt} - gt$$

$$= v_0 - u\ln\frac{m_0 - qt}{m_0} - gt \qquad (1)$$

Integrating again to obtain the displacement,

$$s = s_0 + v_0 t - u\int_0^t \ln\frac{m_0 - qt}{m_0}\,dt - \frac{1}{2}gt^2$$

Let $$z = \frac{m_0 - qt}{m_0} \qquad dz = -\frac{q}{m_0}\,dt \qquad dt = -\frac{m_0}{q}\,dz$$

Then $$s = s_0 + v_0 t + \frac{m_0 u}{q}\int_{z_0}^{z} \ln z\,dz - \frac{1}{2}gt^2$$

$$= s_0 + v_0 t + \frac{m_0 u}{q}(z\ln z + z)\Big|_{z_0}^{z} - \frac{1}{2}gt^2$$

$$= s_0 + v_0 t + \frac{m_0 u}{q}\left[\frac{m_0 - qt}{m_0}\ln\frac{m_0 - qt}{m_0} + \frac{m_0 - qt}{m_0} - \frac{m_0}{m_0}\ln\frac{m_0}{m_0} + \frac{m_0}{m_0}\right] - \frac{1}{2}gt^2$$

$$= s_0 + v_0 t + u\left[t + \left(\frac{m_0}{q} - t\right)\ln\frac{m_0 - qt}{m_0}\right] - \frac{1}{2}gt^2 \qquad (2)$$

PROBLEM 14.102 (Continued)

For each stage, $m_{\text{fuel}} = 8900 \text{ kg} \qquad u = 3600 \text{ m/s}$

$$q = 225 \text{ kg/s} \qquad t = \frac{m_{\text{fuel}}}{q} = \frac{8900}{225} = 39.556 \text{ s}$$

For the first stage, $v_0 = 0 \qquad s_0 = 0$

$$m_0 = 540 + (2)(9500) = 19,540 \text{ kg}$$

From Eq. (1),

$$v_1 = 0 - 3600 \ln\frac{19,540 - 8900}{19,540} - (9.81)(39.556)$$

$$= 1800.1 \text{ m/s}$$

From Eq. (2),

(*a*) $$s_1 = 0 + 0 + 3600\left[39.556 + \left(\frac{19,540}{225} - 39.556\right)\ln\frac{19,540 - 8900}{19,540}\right] - \frac{1}{2}(9.81)(39.556)^2$$

$$= 31,249 \text{ m}$$

$h_1 = 31.2 \text{ km}$ ◀

For the second stage, $v_0 = 1800.1 \text{ m/s} \quad s_0 = 31,249 \text{ m}$

$$m_0 = 540 + 9500 = 10,040 \text{ kg}$$

From Eq. (2),

(*b*) $$s_2 = 31,249 + (1800.1)(39.556) + 3600\left[39.556 + \left(\frac{10,040}{225} - 39.556\right)\ln\frac{10,040 - 8900}{10,040}\right]$$

$$- \frac{1}{2}(9.81)(39.556)^2$$

$$= 197,502 \text{ m}$$

$h_2 = 197.5 \text{ km}$ ◀

PROBLEM 14.103

In a jet airplane, the kinetic energy imparted to the exhaust gases is wasted as far as propelling the airplane is concerned. The useful power is equal to the product of the force available to propel the airplane and the speed of the airplane. If v is the speed of the airplane and u is the relative speed of the expelled gases, show that the mechanical efficiency of the airplane is $\eta = 2v/(u+v)$. Explain why $\eta = 1$ when $u = v$.

SOLUTION

Let F be the thrust force, and $\frac{dm}{dt}$ be the mass flow rate.

Absolute velocity of exhaust: $$v_e = u - v$$

Thrust force: $$F = \frac{dm}{dt}(u - v)$$

Power of thrust force: $$P_1 = Fv = \frac{dm}{dt}(u - v)v$$

Power associated with exhaust: $$P_2(\Delta t) = \frac{1}{2}(\Delta m)v_e^2 = \frac{1}{2}(\Delta m)(u - v)^2$$

$$P_2 = \frac{1}{2}\frac{dm}{dt}(u - v)^2$$

Total power supplied by engine: $$P = P_1 + P_2$$

$$P = \frac{dm}{dt}\left[(u - v)v - \frac{1}{2}(u - v)^2\right]$$

$$= \frac{1}{2}\frac{dm}{dt}(u^2 - v^2)$$

Mechanical efficiency: $$\eta = \frac{\text{useful power}}{\text{total power}} = \frac{P_1}{P}$$

$$\eta = \frac{2(u - v)v}{u^2 - v^2}$$

$$\eta = \frac{2v}{(u + v)} \quad \blacktriangleleft$$

$\eta = 1$ when $u = v$. The exhaust, having zero velocity, carries no power away.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.104

In a rocket, the kinetic energy imparted to the consumed and ejected fuel is wasted as far as propelling the rocket is concerned. The useful power is equal to the product of the force available to propel the rocket and the speed of the rocket. If v is the speed of the rocket and u is the relative speed of the expelled fuel, show that the mechanical efficiency of the rocket is $\eta = 2uv/(u^2 + v^2)$. Explain why $\eta = 1$ when $u = v$.

SOLUTION

Let F be the thrust force and $\frac{dm}{dt}$ be the mass flow rate.

Absolute velocity of exhaust: $v_e = u - v$

Thrust force: $F = \frac{dm}{dt}u$

Power of thrust force: $P_1 = Fv = \frac{dm}{dt}uv$

Power associated with exhaust: $P_2(\Delta t) = \frac{1}{2}(\Delta m)v_e^2 = \frac{1}{2}(\Delta m)(u - v)^2$

$$P_2 = \frac{1}{2}\frac{dm}{dt}(u - v)^2$$

Total power supplied by engine: $P = P_1 + P_2$

$$P = \frac{dm}{dt}\left[uv - \frac{1}{2}(u - v)^2\right] = \frac{1}{2}\frac{dm}{dt}(u^2 - v^2)$$

Mechanical efficiency: $\eta = \frac{\text{useful power}}{\text{total power}} = \frac{P_1}{P}$

$$\eta = \frac{2uv}{(u^2 + v^2)} \blacktriangleleft$$

$\eta = 1$ when $u = v$. The exhaust, having zero velocity, carries no power away.

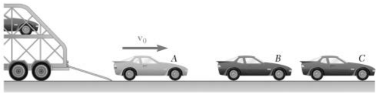
PROBLEM 14.105



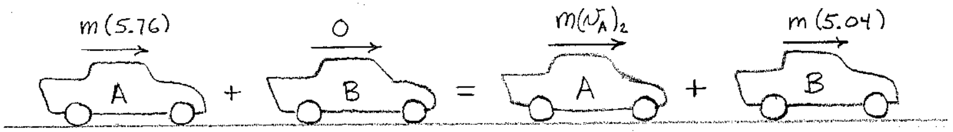
Three identical cars are being unloaded from an automobile carrier. Cars B and C have just been unloaded and are at rest with their brakes off when car A leaves the unloading ramp with a velocity of 5.76 ft/s and hits car B, which hits car C. Car A then again hits car B. Knowing that the velocity of car B is 5.04 ft/s after the first collision, 0.630 ft/s after the second collision, and 0.709 ft/s after the third collision, determine (*a*) the final velocities of cars A and C, (*b*) the coefficient of restitution for each of the collisions.

SOLUTION

There are no horizontal forces acting. Horizontal momentum is conserved.

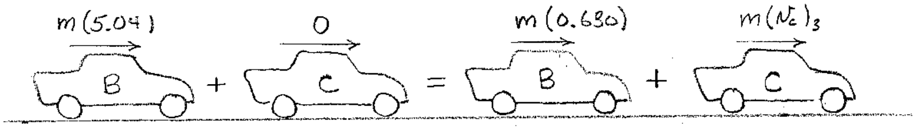
(a) *Velocities*:

Event 1⟶2: Car A hits car B.



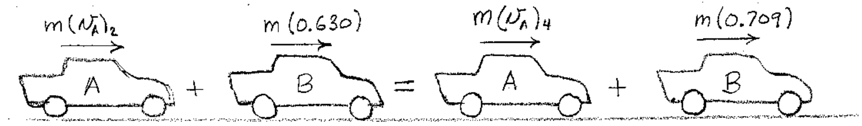
$$m(5.76) + 0 = m(v_A)_2 + m(5.04) \qquad (\mathbf{v}_A)_2 = 0.720 \text{ ft/s} \longrightarrow$$

Event 2⟶3: Car B hits car C.



$$m(5.04) + 0 = m(0.630) + m(v_C)_3 \qquad (\mathbf{v}_C)_3 = 4.41 \text{ ft/s} \longrightarrow \blacktriangleleft$$

Event 3⟶4: Car A hits car B again.



$$m(0.720) + m(0.630) = m(v_A)_4 + m(0.709) \qquad (\mathbf{v}_A)_4 = 0.641 \text{ ft/s} \longrightarrow \blacktriangleleft$$

(*b*) *Coefficients of restitution*:

Event 1⟶2: $$e_{1\to2} = \left|\frac{(v_A)_2 - (v_B)_2}{(v_A)_1 - (v_B)_1}\right| = \frac{5.04 - 0.720}{5.76 - 0} \qquad e_{1\to2} = 0.750 \blacktriangleleft$$

Event 2⟶3: $$e_{2\to3} = \left|\frac{(v_B)_3 - (v_C)_3}{(v_B)_2 - (v_C)_2}\right| = \frac{4.41 - 0.630}{5.04 - 0} \qquad e_{2\to3} = 0.750 \blacktriangleleft$$

Event 3⟶4: $$e_{3\to4} = \left|\frac{(v_A)_4 - (v_B)_4}{(v_A)_3 - (v_B)_3}\right| = \frac{0.709 - 0.641}{0.720 - 0.630} \qquad e_{3\to4} = 0.756 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 14.106

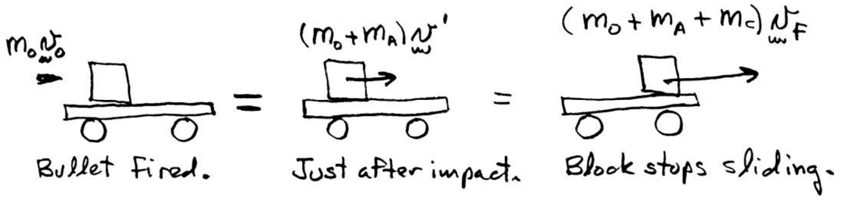
A 30-g bullet is fired with a velocity of 480 m/s into block A, which has a mass of 5 kg. The coefficient of kinetic friction between block A and cart BC is 0.50. Knowing that the cart has a mass of 4 kg and can roll freely, determine (a) the final velocity of the cart and block, (b) the final position of the block on the cart.

SOLUTION

(a) Conservation of linear momentum:



$$m_0 v_0 = (m_0 + m_A)v' = (m_0 + m_A + m_C)v_f$$

$$(0.030 \text{ kg})(480 \text{ m/s}) = (5.030 \text{ kg})v' = (9.030 \text{ kg})v_f$$

$$v' = \frac{0.030}{5.030}(480 \text{ m/s}) = 2.863 \text{ m/s}$$

$$v_f = \frac{0.030}{9.030}(480 \text{ m/s}) = 1.5947 \text{ m/s}$$

$v_f = 1.595$ m/s ◀

(b) Work-energy principle:

Just after impact:

$$T' = \frac{1}{2}(m_0 + m_A)v'^2$$

$$= \frac{1}{2}(5.030 \text{ kg})(2.863 \text{ m/s})^2$$

$$= 20.615 \text{ J}$$

Final kinetic energy:

$$T_f = \frac{1}{2}(m_0 + m_A + m_C)\frac{1}{2}v_f^2$$

$$= \frac{1}{2}(9.030 \text{ kg})(1.5947 \text{ m/s})^2$$

$$= 11.482 \text{ J}$$

Work of friction force:

$$F = \mu_k N$$

$$= \mu_k (m_0 + m_A)g$$

$$= 0.50(5.030)(9.81)$$

$$= 24.672 \text{ N}$$

$\text{Work} = U = -Fx = -24.672x$

$$T' + U = T_f: \quad 20.615 - 24.672x = 11.482$$

$x = 0.370$ m ◀

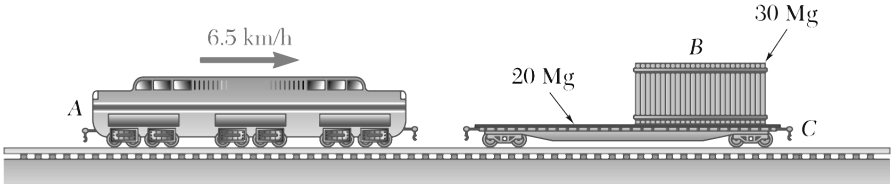
PROBLEM 14.107

An 80-Mg railroad engine *A* coasting at 6.5 km/h strikes a 20-Mg flatcar *C* carrying a 30-Mg load *B* which can slide along the floor of the car ($\mu_k = 0.25$). Knowing that the car was at rest with its brakes released and that it automatically coupled with the engine upon impact, determine the velocity of the car (*a*) immediately after impact, (*b*) after the load has slid to a stop relative to the car.



SOLUTION

The masses are the engine $(m_A = 80\times 10^3 \text{ kg})$, the load $(m_B = 30\times 10^3 \text{ kg})$, and the flat car $(m_C = 20\times 10^3 \text{ kg})$.

Initial velocities:

$$(v_A)_0 = 6.5 \text{ km/h}$$
$$= 1.80556 \text{ m/s}$$
$$(v_B)_0 = (v_C)_0 = 0.$$

No horizontal external forces act on the system during the impact and while the load is sliding relative to the flat car. Momentum is conserved.

Initial momentum:
$$m_A(v_A)_0 + m_B(0) + m_C(0) = m_A(v_A)_0 \qquad (1)$$

(*a*) Let v' be the common velocity of the engine and flat car immediately after impact. Assume that the impact takes place before the load has time to acquire velocity.

Momentum immediately after impact:

$$m_A v' + m_B(0) + m_C v' = (m_A + m_C)v' \qquad (2)$$

Equating (1) and (2) and solving for v',

$$v' = \frac{m_A(v_A)_0}{m_A + m_C}$$
$$= \frac{(80\times 10^3)(1.80556)}{(100\times 10^3)}$$
$$= 1.44444 \text{ m/s}$$

$\mathbf{v}' = 5.20 \text{ km/h} \longrightarrow$ ◀

(*b*) Let v_f be the common velocity of all three masses after the load has slid to a stop relative to the car.

Corresponding momentum:

$$m_A v_f + m_B v_f + m_C v_f = (m_A + m_B + m_C)v_f \qquad (3)$$

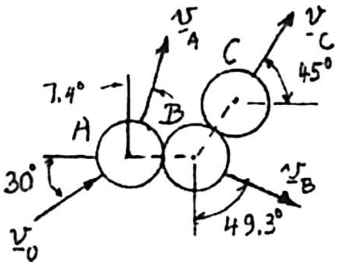
	**PROBLEM 14.108** In a game of pool, ball A is moving with a velocity $\mathbf{v}_0$ when it strikes balls B and C which are at rest and aligned as shown. Knowing that after the collision the three balls move in the directions indicated and that $v_0 = 12$ ft/s and $v_C = 6.29$ ft/s, determine the magnitude of the velocity of (a) ball A, (b) ball B.

SOLUTION



Conservation of linear momentum. In x direction:

$$m(12\text{ ft/s})\cos 30° = mv_A \sin 7.4° + mv_B \sin 49.3° + m(6.29)\cos 45°$$

$$0.12880v_A + 0.75813v_B = 5.9446 \qquad (1)$$

In y direction:

$$m(12\text{ ft/s})\sin 30° = mv_A \cos 7.4° - mv_B \cos 49.3° + m(6.29)\sin 45°$$

$$0.99167v_A - 0.65210v_B = 1.5523 \qquad (2)$$

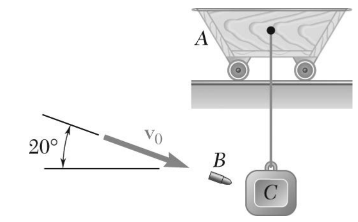
(a) Multiply (1) by 0.65210, (2) by 0.75813, and add:

$$0.83581\, v_A = 5.0533 \qquad v_A = 6.05\text{ ft/s} \blacktriangleleft$$

(b) Multiply (1) by 0.99167, (2) by –0.12880, and add:

$$0.83581\, v_B = 5.6951 \qquad v_B = 6.81\text{ ft/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

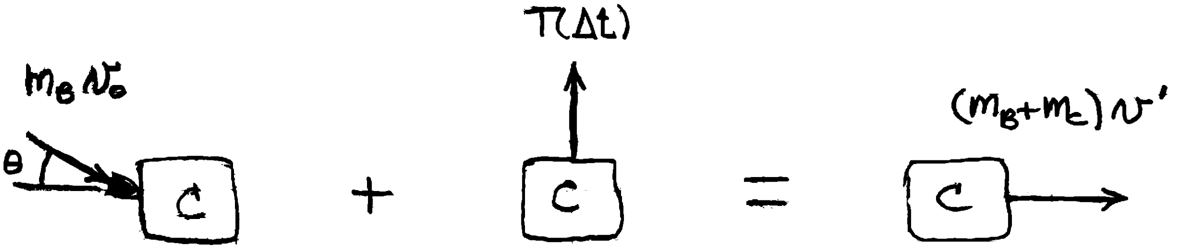


PROBLEM 14.109

Mass *C*, which has a mass of 4 kg, is suspended from a cord attached to cart *A*, which has a mass of 5 kg and can roll freely on a frictionless horizontal track. A 60-g bullet is fired with a speed v_0 = 500 m/s and gets lodged in block *C*. Determine (*a*) the velocity of *C* as it reaches its maximum elevation, (*b*) the maximum vertical distance *h* through which *C* will rise.

SOLUTION

Consider the impact as bullet *B* hits mass *C*. Apply the principle of impulse-momentum to the two particle system.



$$\Sigma m\mathbf{v}_1 + \Sigma\mathbf{Imp}_{1\to 2} = \Sigma m\mathbf{v}_2$$

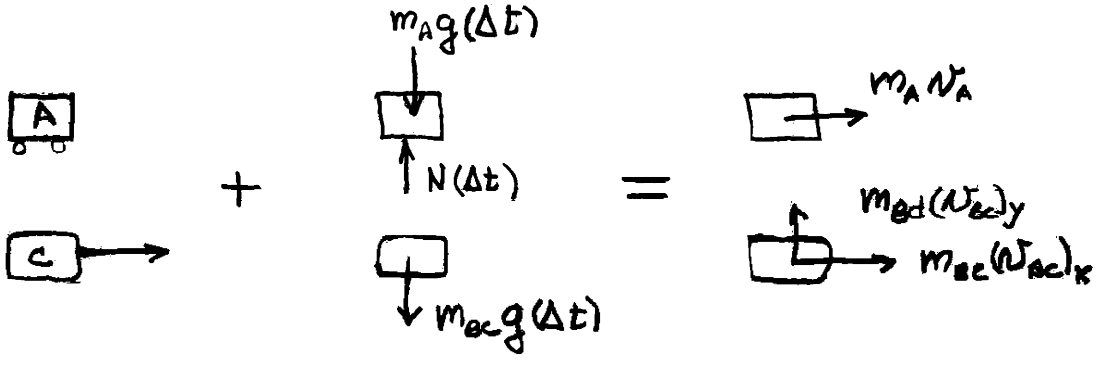
Using both *B* and *C* and taking horizontal components gives

$$m_B v_0 \cos\theta + O = (m_B + m_C)v' = m_{BC}v'$$

$$v' = \frac{m_B v_0 \cos\theta}{m_{BC}}$$

$$= \frac{(0.060 \text{ kg})(500 \text{ m/s})\cos 20°}{(4.06 \text{ kg})} = 6.9435 \text{ m/s}$$

Now consider the system of m_A and m_{BC} after the impact, and apply to impulse momentum principle.



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$\Sigma m\mathbf{v}_2 + \Sigma \mathbf{Imp}_{2\to 3} = \Sigma m\mathbf{v}_3$$

Horizontal components: $+\longrightarrow$

$$m_{BC}v' + 0 = m_A v_A + m_{BC} v_{cx}$$

$$v_A = \frac{m_{BC}}{m_A}(v' - v_{cx})$$

$$= \frac{4.06}{5}(6.9435 - v_{cx})$$

$$v_A = 5.6381 - 0.812 v_{cx} \quad \text{in m/s} \tag{1}$$

(*a*) At maximum elevation.

Both particles have the same velocity, thus

$$v_{cx} = v_A$$

$$v_A = 5.6381 - 0.812\, v_A$$

$$v_A = 3.1115 \text{ m/s}$$

$v_A = 3.11$ m/s ◀

(*b*) Conservation of energy: $T_2 + V_2 = T_3 + V_3$

$$T_2 = \frac{1}{2} m_A (0) + \frac{1}{2} m_{BC} (v')^2$$

$$= \frac{1}{2}(4.06)(6.9435)^2 = 97.871 \text{ J}$$

$$V_2 = 0 \qquad \text{(datum)}$$

$$T_3 = \frac{1}{2} m_A v_A^2 + \frac{1}{2} m_{BC} (v_{Bx}^2 + v_{By}^2)^2$$

$$= \frac{1}{2}(5)(3.1115)^2 + \frac{1}{2}(4.06)[(3.1115)^2 + 0] = 43.857 \text{ J}$$

$$V_3 = m_{BC} g h = (4.06)(9.81) h = 39.829 \text{ h}$$

$$97.871 + 0 = 43.857 + 39.829 \text{ h}$$

$h = 1.356$ m ◀

<u>Another method</u>: We observe that no external horizontal forces are exerted on the system consisting of *A*, *B*, and *C*. Thus the horizontal component of the velocity of the mass center remains constant.

$$m = m_A + m_B + m_C = 5 + 0.06 + 4 = 9.06 \text{ kg}$$

$$\bar{v}_x = \frac{m_B v_0 \cos\theta}{m_A + m_B + m_C} = \frac{(0.060 \text{ kg})(500 \text{ m/s})\cos 20^\circ}{9.06 \text{ kg}} = 3.1115 \text{ m/s}$$

(*a*) At maximum elevation, v_A and v_{BC} are equal.

$$v_A = 3.1115 \text{ m/s}$$

$\mathbf{v}_A = 3.11$ m/s $\longrightarrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Immediately after the impact of B on C, the velocity v_A is zero.

$$(m_B + m_C)v' = (m_A + m_B + m_C)\bar{v}_x$$

$$v' = \frac{m_A + m_B + m_C}{m_B + m_C}\bar{v}_x = \frac{9.06}{4.06}(3.1115 \text{ m/s}) = 6.9435 \text{ m/s}$$

(*b*) Principle of work and energy: $T_2 + V_2 = T_3 + V_3$

$T_2, V_2,$ and V_3 are calculated as before.

For T_3 we note that the velocities $\mathbf{v}'_A$ and $\mathbf{v}'_{BC}$ relative to the mass center are zero. Thus, T_3 is given by

$$T_3 = \frac{1}{2}m\bar{\mathbf{v}}^2 = \frac{1}{2}(9.06)(3.1115)^2 = 43.857 \text{ J}$$

As before, h is found to be $h = 1.356 \text{ m}$ ◀

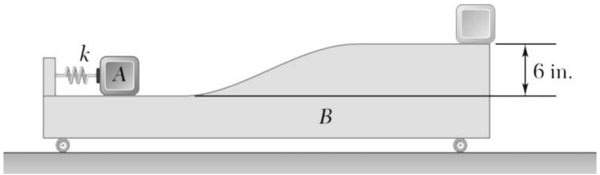
PROBLEM 14.110



A 15-lb block *B* is at rest and a spring of constant $k = 72$ lb/in. is held compressed 3 in. by a cord. After 5-lb block *A* is placed against the end of the spring, the cord is cut causing *A* and *B* to move. Neglecting friction, determine the velocities of blocks *A* and *B* immediately after *A* leaves *B*.

SOLUTION

$$m_A = \frac{5}{32.2} = 0.15528 \text{ lb}\cdot\text{s}^2/\text{ft}$$

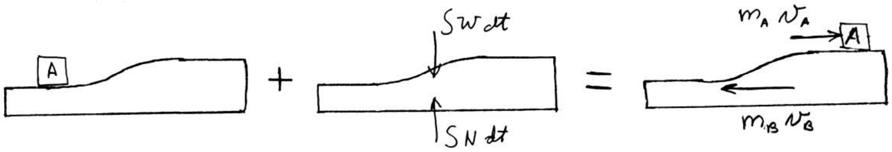
$$m_B = \frac{15}{32.2} = 0.46584 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$k = 72 \text{ lb/in} = 864 \text{ lb/ft}$$

$$e = 3 \text{ in.} = 0.25 \text{ ft}$$

$$h = 6 \text{ in.} = 0.5 \text{ ft}$$

Conservation of linear momentum:

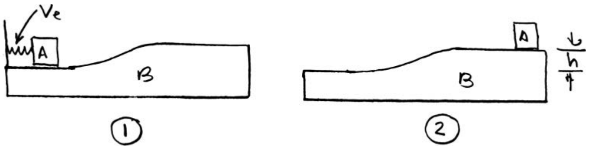


Horizontal components $\xrightarrow{+}$:

$$0 + 0 = m_A v_A - m_B v_B$$

$$v_B = \frac{m_A}{m_B} v_A = \frac{1}{3} v_A$$

Conservation of energy:



State 1:

$$V_{1e} = \frac{1}{2} k e^2 = \frac{1}{2}(864)(0.25)^2 = 27 \text{ ft}\cdot\text{lb}$$

$$V_{1g} = 0$$

$$T_1 = 0$$

State 2:

$$V_{2e} = 0$$

$$V_{2g} = W_A h = (5)(0.5) = 2.5 \text{ ft}\cdot\text{lb}$$

$$T_2 = \frac{1}{2} m_A v_A^2 + \frac{1}{2} m_B v_B^2$$

$$= \frac{1}{2}(0.15528) v_A^2 + \frac{1}{2}(0.46584)\left(\frac{v_A}{3}\right)^2 = 0.10352 v_A^2$$

PROBLEM 14.111

Car A was at rest 9.28 m south of the Point O when it was struck in the rear by car B, which was traveling north at a speed v_B. Car C, which was traveling west at a speed v_C, was 40 m east of Point O at the time of the collision. Cars A and B stuck together and, because the pavement was covered with ice, they slid into the intersection and were struck by car C which had not changed its speed. Measurements based on a photograph taken from a traffic helicopter shortly after the second collision indicated that the positions of the cars, expressed in meters, were $\mathbf{r}_A = -10.1\mathbf{i} + 16.9\mathbf{j}$, $\mathbf{r}_B = -10.1\mathbf{i} + 20.4\mathbf{j}$, and $\mathbf{r}_C = -19.8\mathbf{i} - 15.2\mathbf{j}$. Knowing that the masses of cars A, B, and C are, respectively, 1400 kg, 1800 kg, and 1600 kg, and that the time elapsed between the first collision and the time the photograph was taken was 3.4 s, determine the initial speeds of cars B and C.

SOLUTION

Mass center at time of first collision.

$$(m_A + m_B + m_C)\overline{\mathbf{r}}_1 = m_A(\mathbf{r}_A)_1 + m_B(\mathbf{r}_B)_1 + m_C(\mathbf{r}_C)_1$$

$$4800\,\overline{\mathbf{r}}_1 = (1400)(-9.28\mathbf{j}) + (1800)(-12.8\mathbf{j}) + (1600)(40\mathbf{i})$$

$$\overline{\mathbf{r}}_1 = (13.3333\text{ m})\mathbf{i} - (7.5067\text{ m})\mathbf{j}$$

Mass center at time of photo.

$$(m_A + m_B + m_C)\overline{\mathbf{r}}_2 = m_A(\mathbf{r}_A)_2 + m_B(\mathbf{r}_B)_2 + m_C(\mathbf{r}_C)_2$$

$$4800\,\overline{\mathbf{r}}_2 = (1400)(-10.1\mathbf{i} + 16.9\mathbf{j}) + (1800)(-10.1\mathbf{i} + 20.4\mathbf{j}) + (1600)(-19.8\mathbf{i} - 15.2\mathbf{j})$$

$$\overline{\mathbf{r}}_2 = -(13.3333\text{ m})\mathbf{i} + (7.5125\text{ m})\mathbf{j}$$

Since no external horizontal forces act, momentum is conserved and the mass center moves at constant velocity.

$$(m_A + m_B + m_C)\overline{\mathbf{v}} = m_A(\mathbf{v}_A)_1 + m_B(\mathbf{v}_B)_1 + m_C(\mathbf{v}_C)_1 \tag{1}$$

$$\overline{\mathbf{r}}_2 - \overline{\mathbf{r}}_1 = \overline{\mathbf{v}}t \tag{2}$$

Combining (1) and (2),

$$(m_A + m_B + m_C)(\overline{\mathbf{r}}_2 - \overline{\mathbf{r}}_1) = [m_A(\mathbf{v}_A)_1 + m_B(\mathbf{v}_B)_1 + m_C(\mathbf{v}_C)_1]\,t$$

$$(4800)(-26.6667\mathbf{i} + 15.0192\mathbf{j}) = [0 + (1800)(v_B)_1\mathbf{j} - (1600)(v_C)_1\mathbf{i}](3.4)$$

Components. $\quad \mathbf{j}$: $72092 = 6120(v_B)_1, \quad (v_B)_1 = 11.78\text{ m/s}, \quad v_B = 42.4\text{ km/h}$ ◀

$\mathbf{i}$: $-128000 = -5440\,(v_C)_1, \quad (v_C)_1 = 23.53\text{ m/s}, \quad v_C = 84.7\text{ km/h}$ ◀

PROBLEM 14.113

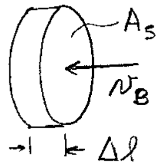
Prior to takeoff the pilot of a 6000-lb twin-engine airplane tests the reversible-pitch propellers with the brakes at Point B locked. Knowing that the velocity of the air in the two 6.6-ft-diameter slipstreams is 60 ft/s and that Point G is the center of gravity of the airplane, determine the reactions at Points A and B. Assume $\gamma = 0.075\ \text{lb/ft}^3$ and neglect the approach velocity of the air.

SOLUTION

Let F be the force exerted on the slipstream of one engine.

$$F = \frac{dm}{dt}(v_B - v_A)$$

Calculation of $\dfrac{dm}{dt}$. mass = density × volume = density × area × length



$$\Delta m = \rho A_B(\Delta l) = \rho A_B v_B(\Delta t) = \frac{\gamma A_B\, v_B(\Delta t)}{g}$$

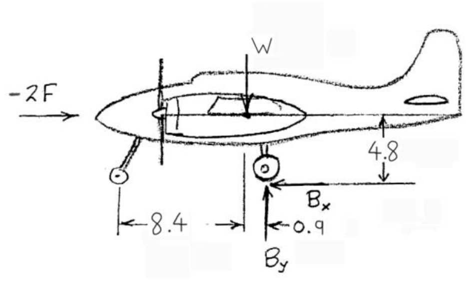
$$\frac{\Delta m}{\Delta t} = \frac{\gamma A_B v_B}{g} \quad \text{or} \quad \frac{dm}{dt} = \frac{\gamma}{g}\left(\frac{\pi}{4}D^2\right)v_B$$

Assume that v_A, the velocity far upstream, is negligible.

$$F = \frac{\gamma}{g}\left(\frac{\pi}{4}D^2\right)v_B\left(v_B - 0\right) = \left(\frac{0.075}{32.2}\right)\left(\frac{\pi}{4}\right)(6.6)^2(60)^2 = 286.87\ \text{lb} \longleftarrow$$

The force exerted by two slipstreams on the airplane is $-2F$. $\quad -2F = 573.74\ \text{lb} \longrightarrow$

Statics.



$$+\circlearrowleft \Sigma M_B = 0:$$

$$A = \frac{1}{9.3}[(0.9)(6000) - (4.8)(573.74)]$$

$$= 284.5\ \text{lb} \qquad \mathbf{A} = 285\ \text{lb}\uparrow \blacktriangleleft$$

$$\xrightarrow{+} F_x = 0: \quad -2F - B_x = 0$$

$$B_x = -2F = 573.74\ \text{lb} \longleftarrow$$

$$+\uparrow \Sigma F_y = 0: \quad A + B_y - W = 284.5 + B_y - (6000) = 0$$

$$B_y = 5715.5\ \text{lb}\uparrow$$

$$\mathbf{B} = [573.74\ \text{lb} \longleftarrow] + [5715.5\ \text{lb}\uparrow]$$

$$\mathbf{B} = 5740\ \text{lb} \measuredangle 84.3° \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 14.114

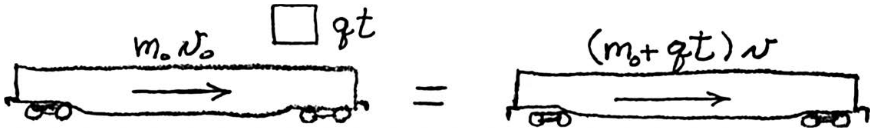
A railroad car of length L and mass m_0 when empty is moving freely on a horizontal track while being loaded with sand from a stationary chute at a rate $dm/dt = q$. Knowing that the car was approaching the chute at a speed v_0, determine (*a*) the mass of the car and its load after the car has cleared the chute, (*b*) the speed of the car at that time.

SOLUTION

Consider the conservation of the horizontal component of momentum of the railroad car of mass m_0 and the sand mass qt.



$$m_0 v_0 = (m_0 + qt)v \qquad v = \frac{m_0 v_0}{m_0 + qt} \tag{1}$$

$$\frac{dx}{dt} = v = \frac{m_0 v_0}{m_0 + qt}$$

Integrating, using $x_0 = 0$ and $x = L$ when $t = t_L$,

$$L = \int_0^{t_L} v\,dt = \int_0^{t_L} \frac{m_0 v_0}{m_0 + qt}\,dt = \frac{m_0 v_0}{q}[\ln(m_0 + qt_L) - \ln m_0]$$

$$= \frac{m_0 v_0}{q} \ln \frac{m_0 + qt_L}{m_0}$$

$$\ln \frac{m_0 + qt_L}{m_0} = \frac{qL}{m_0 v_0} \qquad \frac{m_0 + qt_L}{m_0} = e^{qL/m_0 v_0}$$

(*a*) Final mass of railroad car and sand $\qquad m_0 + qt_L = m_0 e^{qL/m_0 v_0}$ ◀

(*b*) Using Eq. (1), $\qquad v_L = \dfrac{m_0 v_0}{m_0 + qt_L} = \dfrac{m_0 v_0}{m_0} e^{-qL/m_0 v_0}$

$$v_L = v_0 e^{-qL/m_0 v_0}$$ ◀

PROBLEM 14.115

A garden sprinkler has four rotating arms, each of which consists of two horizontal straight sections of pipe forming an angle of 120° with each other. Each arm discharges water at a rate of 20 L/min with a velocity of 18 m/s relative to the arm. Knowing that the friction between the moving and stationary parts of the sprinkler is equivalent to a couple of magnitude $M = 0.375\ \text{N}\cdot\text{m}$, determine the constant rate at which the sprinkler rotates.

SOLUTION

The flow through each arm is 20 L/min.

$$Q = \frac{20\ \text{L/min}}{1000\ \text{L/m}^3} \times \frac{1\,\text{min}}{60\ \text{s}} = 333.33 \times 10^{-6}\ \text{m}^3/\text{s}$$

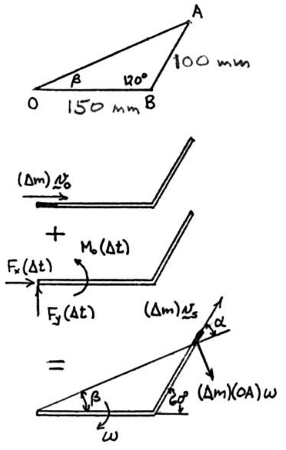
$$\frac{dm}{dt} = \rho Q = (1000\ \text{kg/m}^3)(333.33 \times 10^{-6})$$
$$= 0.33333\ \text{kg/s}$$

Consider the moment about O exerted on the fluid stream of one arm. Apply the impulse-momentum principle. Compute moments about O. First, consider the geometry of triangle OAB. Using first the law of cosines,

$$(OA)^2 = 150^2 + 100^2 - (2)(150)(100)\cos 120°$$
$$OA = 217.95\ \text{mm} = 0.21795\ \text{m}$$

Law of sines: $$\frac{\sin\beta}{100} = \frac{\sin 120°}{217.95}$$

$$\beta = 23.413°, \quad \alpha = 60° - \beta = 36.587°$$



$+\circlearrowleft$ Moments about O:

$$(\Delta m)(v_O)(0) + M_O(\Delta t) = (OA)(\Delta m)v_s \sin\alpha - (OA)(\Delta m)(OA)\omega$$

$$M_O = \frac{\Delta m}{\Delta t}[(OA)v_s \sin\alpha - (OA)^2\omega]$$
$$= (0.33333)[(0.21795)(18)\sin 36.587° - (0.21795)^2\omega]$$
$$= 0.77945 - 0.015834\omega$$

Moment that the stream exerts on the arm is $-M_O$.

Balance of the friction couple and the four streams

$$M_F - 4M_O = 0$$

$$0.375 - 4(0.77945 - 0.015834\omega) = 0$$

$$\omega = 43.305\ \text{rad/s} \qquad \omega = 414\ \text{rpm} \blacktriangleleft$$

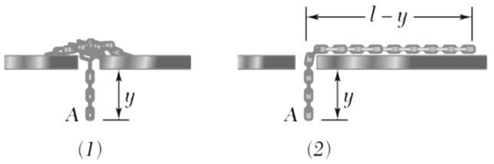
PROBLEM 14.116

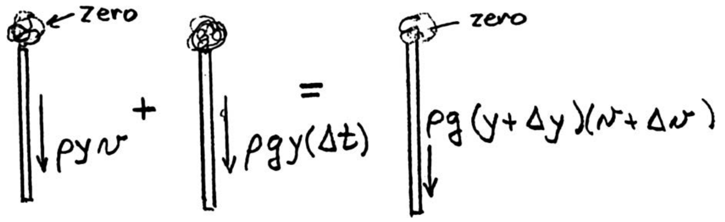


A chain of length l and mass m falls through a small hole in a plate. Initially, when y is very small, the chain is at rest. In each case shown, determine (a) the acceleration of the first link A as a function of y, (b) the velocity of the chain as the last link passes through the hole. In case 1, assume that the individual links are at rest until they fall through the hole; in case 2, assume that at any instant all links have the same speed. Ignore the effect of friction.

SOLUTION

Let ρ be the mass per unit length of chain. Assume that the weight of any chain above the hole is supported by the floor. It and the corresponding upward reaction of the floor are not shown in the diagrams.

Case 1: Apply the impulse-momentum principle to the entire chain.



$$\rho yv + \rho gy\Delta t = \rho(y+\Delta y)(v+\Delta v)$$

$$= \rho yv + \rho(\Delta y)v + \rho y(\Delta v) + \rho(\Delta y)(\Delta v)$$

$$\rho gy = \rho\frac{\Delta y}{\Delta t}v + \rho y\frac{\Delta v}{\Delta t} + \rho\frac{(\Delta y)(\Delta v)}{\Delta t}$$

Let $\Delta t \to 0$.
$$\rho gy = \rho\frac{dy}{dt}v + \rho y\frac{dv}{dt}$$

$$= \rho\frac{d}{dt}(yv)$$

Multiply both sides by yv.
$$\rho gy^2 v = \rho yv\frac{d}{dt}(yv)$$

Let $v = \dfrac{dy}{dt}$ on left hand side.
$$\rho gy^2\frac{dy}{dt} = \rho yv\frac{d}{dt}(yv)$$

Integrate with respect to time.
$$\rho g\int y^2 dy = \rho\int (yv)\,d(yv)$$

$$\frac{1}{3}\rho gy^3 = \frac{1}{2}\rho(yv)^2 \quad \text{or} \quad v^2 = \frac{2}{3}gy \qquad (1)$$

Differentiate with respect to time.
$$2v\frac{dv}{dt} = \frac{2}{3}g\frac{dy}{dt} = \frac{2}{3}gv$$

PROBLEM 15.5

A small grinding wheel is attached to the shaft of an electric motor which has a rated speed of 3600 rpm. When the power is turned on, the unit reaches its rated speed in 5 s, and when the power is turned off, the unit coasts to rest in 70 s. Assuming uniformly accelerated motion, determine the number of revolutions that the motor executes (*a*) in reaching its rated speed, (*b*) in coasting to rest.

SOLUTION

For uniformly accelerated motion,

$$\omega = \omega_0 + \alpha t \qquad (1)$$

$$\theta = \theta_0 + \omega_0 t + \frac{1}{2}\alpha t^2 \qquad (2)$$

(*a*) Data for start up: $\theta_0 = 0, \ \omega_0 = 0,$

At $t = 5$ s, $\omega = 3600 \text{ rpm} = \dfrac{2\pi(3600)}{60} = 120\pi \text{ rad/s}$

From Eq. (1), $120\pi = \alpha(5) \qquad \alpha = 24\pi \text{ rad/s}^2$

From Eq. (2), $\theta = 0 + 0 + \dfrac{1}{2}(24\pi)(5)^2 = 300\pi$ radians

In revolutions, $\theta = \dfrac{300\pi}{2\pi}$ $\qquad \theta = 150$ rev ◀

(*b*) Data for coasting to rest:

$$\theta_0 = 0, \quad \omega_0 = 120\pi \text{ rad/s}$$

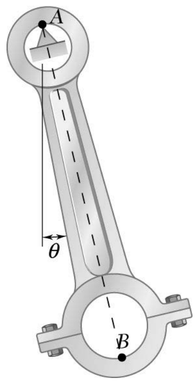
At $t = 70$ s, $\omega = 0$

From Eq. (1), $0 = 120\pi - \alpha(70) \qquad \alpha = \dfrac{120\pi}{70}$ rad/s

From Eq. (2), $\theta = 0 + (120\pi)(70) - \dfrac{(120\pi)(70)^2}{2(70)} = 4200\pi$ radians

In revolutions, $\theta = \dfrac{4200\pi}{2\pi}$ $\qquad \theta = 2100$ rev ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.6

A connecting rod is supported by a knife-edge at Point A. For small oscillations the angular acceleration of the connecting rod is governed by the relation $\alpha = -6\theta$ where α is expressed in rad/s^2 and θ in radians. Knowing that the connecting rod is released from rest when $\theta = 20°$, determine (*a*) the maximum angular velocity, (*b*) the angular position when $t = 2$ s.

SOLUTION

Angular motion relations:

$$\alpha = \frac{d\omega}{dt} = \frac{\omega d\omega}{d\theta} = -6\theta \qquad (1)$$

Separation of variables ω and θ gives

$$\omega d\omega = -6\theta d\theta$$

Integrating, using $\omega = 0$ when $\theta = \theta_0$,

$$\int_0^{\omega} \omega d\omega = -6\int_{\theta_0}^{\theta} \theta d\theta$$

$$\frac{1}{2}\omega^2 = -3(\theta^2 - \theta_0^2) = 3(\theta_0^2 - \theta^2)$$

$$\omega^2 = 6(\theta_0^2 - \theta^2) \qquad \omega = \sqrt{6(\theta_0^2 - \theta^2)}$$

(*a*) ω is maximum when $\theta = 0$.

Data: $\theta_0 = 20° = 0.34907$ radians

$$\omega_{max}^2 = 6(0.34907^2 - 0) = 0.73108 \text{ rad}^2/\text{s} \qquad \omega_{max} = 0.855 \text{ rad/s} \blacktriangleleft$$

(*b*) From $\omega = \dfrac{d\theta}{dt}$ we get $dt = \dfrac{d\theta}{\omega} = \dfrac{1}{\sqrt{6}} \dfrac{d\theta}{\sqrt{\theta_0^2 - \theta^2}}$

Integrating, using $t = 0$ when $\theta = \theta_0$,

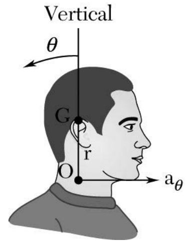
$$\int_0^t dt = \frac{1}{\sqrt{6}} \int_{\theta_0}^{\theta} \frac{d\theta}{\sqrt{\theta_0^2 - \theta^2}}$$

$$t = -\frac{1}{\sqrt{6}} \cos^{2-1} \frac{\theta}{\theta_0}\Bigg|_{\theta_0}^{\theta} = -\frac{1}{\sqrt{6}}\left[0 - \cos^{-1}\frac{\theta}{\theta_0}\right] = -\frac{1}{\sqrt{6}} \cos^{-1}\frac{\theta}{\theta_0}$$

$$\theta = \theta_0 \cos(\sqrt{6}t) = 0.34907 \cos[(\sqrt{6})2] = (0.34907)(0.18551) = 0.064756 \text{ radians}$$

$$\theta = 3.71° \blacktriangleleft$$

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.7

When studying whiplash resulting from rear end collisions, the rotation of the head is of primary interest. An impact test was performed, and it was found that the angular acceleration of the head is defined by the relation $\alpha = 700\cos\theta + 70\sin\theta$ where α is expressed in rad/s^2 and θ in radians. Knowing that the head is initially at rest, determine the angular velocity of the head when $\theta = 30°$.

SOLUTION

Angular motion relations:

$$\alpha = \frac{d\omega}{dt} = \frac{\omega d\omega}{d\theta} = 700\cos\theta + 70\sin\theta$$

Separating variables ω and θ gives

$$\omega d\omega = (700\cos\theta + 70\sin\theta)d\theta$$

Integrating, using $\omega = 0$ when $\theta = 0$,

$$\int_0^\omega \omega d\omega = \int_0^\theta (700\cos\theta + 70\sin\theta)d\theta$$

$$\frac{1}{2}\omega^2 = (700\sin\theta - 70\cos\theta)\Big|_0^\theta$$

$$= 700\sin\theta + 70(1 - \cos\theta)$$

$$\omega = \sqrt{1400\sin\theta + 140(1 - \cos\theta)}$$

Data: $\theta = 30° = \dfrac{\pi}{6}$ rad

With calculator set to "degrees" for trigonometric functions,

$$\omega = \sqrt{1400\sin 30° + 140(1 - \cos 30°)} = 26.8 \text{ rad/s}$$

$\omega = 26.8$ rad/s ◀

With calculator set to "radians" for trigonometric functions,

$$\omega = \sqrt{1400\sin(\pi/6) + 140(1 - \cos(\pi/6))} = 26.8 \text{ rad/s}$$

PROBLEM 15.9

The angular acceleration of a shaft is defined by the relation $\alpha = -0.25\omega$, where α is expressed in rad/s^2 and ω in rad/s. Knowing that at $t = 0$ the angular velocity of the shaft is 20 rad/s, determine (*a*) the number of revolutions the shaft will execute before coming to rest, (*b*) the time required for the shaft to come to rest, (*c*) the time required for the angular velocity of the shaft to be reduced to 1 percent of its initial value.

SOLUTION

$$\alpha = -0.25\omega$$

$$\omega \frac{d\omega}{d\theta} = -0.25\omega$$

$$d\omega = -0.25 d\theta$$

(*a*) $$\int_{20\text{ rad/s}}^{0} d\omega = -0.25\int_0^\theta d\theta; \quad (0-20) = -0.25\theta; \quad \theta = 80\text{ rad}$$

$$\theta = (80\text{ rad})\frac{\text{rev}}{2\pi\text{ rad}} \qquad \theta = 12.73\text{ rev} \blacktriangleleft$$

(*b*) $$\alpha = -0.25\omega; \quad \frac{d\omega}{dt} = -0.25\omega; \quad \frac{d\omega}{\omega} = -0.25dt$$

$$\int_{20\text{ rad/s}}^{\omega} \frac{d\omega}{\omega} = -0.25\int_0^t dt \qquad |\ln\omega|_{20}^{\omega} = -0.25t$$

$$t = -\frac{1}{0.25}(\ln\omega - \ln 20) = 4(\ln 20 - \ln\omega)$$

$$t = 4\ln\frac{20}{\omega} \qquad (1)$$

For $\omega = 0$ $$t = 4\ln\frac{20}{0} = 4\ln\infty \qquad t = \infty \blacktriangleleft$$

(*c*) For $$\omega = 0.01\omega_0 = 0.01(20) = 0.2\text{ rad}$$

Use Eq. (1): $$t = 4\ln\left(\frac{20}{0.2}\right) = 4\ln 100 = 4(4.605) \qquad t = 18.42\text{ s} \blacktriangleleft$$

PROBLEM 15.18

A series of small machine components being moved by a conveyor belt pass over a 120 mm radius idler pulley. At the instant shown, the velocity of Point A is 300 mm/s to the left and its acceleration is 180 mm/s^2 to the right. Determine (*a*) the angular velocity and angular acceleration of the idler pulley, (*b*) the total acceleration of the machine component at B.

SOLUTION

$$v_B = v_A = 300 \text{ mm/s} \longleftarrow \qquad r_B = 120 \text{ mm}$$

$$(a_B)_t = a_A = 180 \text{ mm/s} \longrightarrow$$

(*a*) $\quad v_B = \omega r_B, \qquad \omega = \frac{v_B}{r_B} = \frac{300}{120} = 2.5 \text{ rad/s} \circlearrowleft$

$$\boldsymbol{\omega} = 2.50 \text{ rad/s} \circlearrowleft \blacktriangleleft$$

$(a_B)_t = \alpha r_B, \qquad \alpha = \frac{(a_B)_t}{r_B} = \frac{180}{120} = 1.5 \text{ rad/s} \circlearrowright$

$$\boldsymbol{\alpha} = 1.500 \text{ rad/s}^2 \circlearrowright \blacktriangleleft$$

(*b*) $\quad (a_B)_n = r_B\omega^2 = (120)(2.5)^2 = 750 \text{ mm/s}^2 \downarrow$

$$a_B = \sqrt{(a_B)_t^2 + (a_B)_n^2} = \sqrt{(180)^2 + (750)^2} = 771 \text{ mm/s}^2$$

$$\tan\beta = \frac{750}{180}, \qquad \beta = 76.5°$$

$$\mathbf{a}_B = 771 \text{ mm/s}^2 \searrow 76.5° \blacktriangleleft$$

PROBLEM 15.19

A series of small machine components being moved by a conveyor belt pass over a 120-mm-radius idler pulley. At the instant shown, the angular velocity of the idler pulley is 4 rad/s clockwise. Determine the angular acceleration of the pulley for which the magnitude of the total acceleration of the machine component at *B* is 2400 mm/s^2.

SOLUTION

$$\omega_B = 4 \text{ rad/s} \circlearrowright, \quad r_B = 120 \text{ mm}$$

$$(a_B)_n = r_B\omega_B^2 = (120)(4)^2 = 1920 \text{ mm/s}^2$$

$$a_B = 2400 \text{ mm/s}^2$$

$$(a_B)_t = \sqrt{a_B^2 - (a_B)_n^2} = \sqrt{2400^2 - 1920^2} = \pm 1440 \text{ mm/s}^2$$

$$(a_B)_t = r_B\alpha, \qquad \alpha = \frac{(a_B)_t}{r_B} = \frac{\pm 1440}{120} = \pm 12 \text{ rad/s}^2$$

$$12.00 \text{ rad/s}^2 \circlearrowleft \text{ or } \circlearrowright \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 15.20

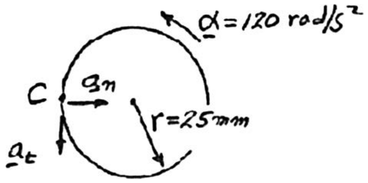
The belt sander shown is initially at rest. If the driving drum B has a constant angular acceleration of 120 rad/s^2 counterclockwise, determine the magnitude of the acceleration of the belt at Point C when (a) $t = 0.5$ s, (b) $t = 2$ s.

SOLUTION

$$a_t = r\alpha = (0.025 \text{ m})(120 \text{ rad/s}^2)$$

$$\mathbf{a}_t = 3 \text{ m/s}^2 \downarrow$$



(a) $t = 0.5$ s:

$$\omega = \alpha t = (120 \text{ rad/s}^2)(0.5 \text{ s}) = 60 \text{ rad/s}$$

$$a_n = r\omega^2 = (0.025 \text{ m})(60 \text{ rad/s})^2$$

$$\mathbf{a}_n = 90 \text{ m/s}^2 \longrightarrow$$

$$a_B^2 = a_t^2 + a_n^2 = 3^2 + 90^2 \qquad a_B = 90.05 \text{ m/s}^2 \blacktriangleleft$$

(b) $t = 2$ s:

$$\omega = \alpha t = (120 \text{ rad/s}^2)(2 \text{ s}) = 240 \text{ rad/s}$$

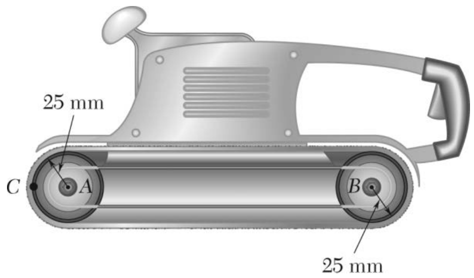
$$a_n = r\omega^2 = (0.025 \text{ m})(240 \text{ rad/s})^2$$

$$a_n = 1440 \text{ m/s}^2$$

$$a_B^2 = a_t^2 + a_n^2 = 3^2 + 1440^2 \qquad a_B = 1440 \text{ m/s}^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.21



The rated speed of drum B of the belt sander shown is 2400 rpm. When the power is turned off, it is observed that the sander coasts from its rated speed to rest in 10 s. Assuming uniformly decelerated motion, determine the velocity and acceleration of Point C of the belt, (a) immediately before the power is turned off, (b) 9 s later.

SOLUTION

$$\omega_0 = 2400 \text{ rpm}$$
$$= 251.3 \text{ rad/s}$$
$$r = 0.025 \text{ m}$$

(a)

$$v_C = r\omega = (0.025 \text{ m})(251.3 \text{ rad/s}) \qquad v_C = 6.28 \text{ m/s} \blacktriangleleft$$

$$a_C = r\omega^2 = (0.025 \text{ m})(251.3 \text{ rad/s})^2 \qquad a_C = 1579 \text{ m/s}^2 \blacktriangleleft$$

(b) When $t = 10$ s:

$$\omega = 0.$$
$$\omega = \omega_0 + \alpha t$$
$$0 = 251.3 \text{ rad/s} + \alpha(10 \text{ s})$$
$$\alpha = -25.13 \text{ rad/s}^2$$

When $t = 9$ s:

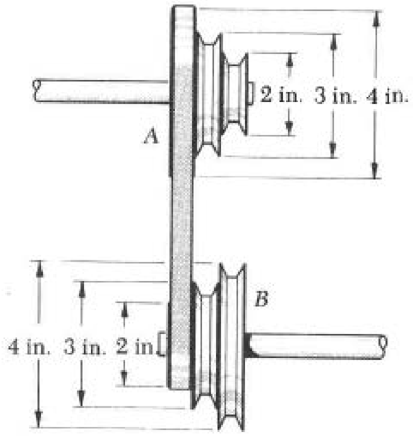
$$\omega = \omega_0 + \alpha t$$
$$\omega_9 = 251.3 \text{ rad/s} - (25.13 \text{ rad/s}^2)(9 \text{ s})$$
$$= 25.13 \text{ rad/s}$$

$$v_C = r\omega_9$$
$$= (0.025 \text{ m})(25.13 \text{ rad/s}) \qquad v_9 = 0.628 \text{ m/s} \blacktriangleleft$$

$$(a_C)_t = r\alpha_n$$
$$= (0.025 \text{ m})(-25.13 \text{ rad/s}^2)$$
$$(a_C)_t = 0.628 \text{ m/s}^2$$
$$(a_C)_n = r\omega_9^2$$
$$= (0.025 \text{ m})(25.13 \text{ rad/s})^2$$
$$(a_C)_n = 15.79 \text{ m/s}^2$$

$$a_C^2 = (a_C)_t^2 + (a_C)_n^2$$
$$= (0.628 \text{ m/s}^2)^2 + (15.79 \text{ m/s}^2)^2 \qquad a_C = 15.80 \text{ m/s}^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.22

The two pulleys shown may be operated with the V belt in any of three positions. If the angular acceleration of shaft A is 6 rad/s^2 and if the system is initially at rest, determine the time required for shaft B to reach a speed of 400 rpm with the belt in each of the three positions.

SOLUTION

Angular velocity of shaft A: $\omega_A = \alpha_A t$

Belt speed: $v = r_A \omega_A = r_B \omega_B$

Angular speed of shaft B: $\omega_B = \dfrac{v}{r_B} = \dfrac{r_A \alpha_A t}{r_B}$

Solving for t, $t = \dfrac{r_B \omega_B}{r_A \alpha_A}$

Data: $\alpha_A = 6$ rad/s, $\omega_B = 400 \text{ rpm} = 41.889 \text{ rad/s}$

$$t = \frac{r_B}{r_A} \cdot \frac{41.889}{6} = 6.9813 \frac{r_B}{r_A} = 6.9813 \frac{d_B}{d_A}$$

Belt at left: $\dfrac{d_B}{d_A} = \dfrac{2 \text{ in.}}{4 \text{ in.}}$ $t = 3.49$ s ◀

Belt in middle: $\dfrac{d_B}{d_A} = \dfrac{3 \text{ in.}}{3 \text{ in.}}$ $t = 6.98$ s ◀

Belt at right: $\dfrac{d_B}{d_A} = \dfrac{4 \text{ in.}}{2 \text{ in.}}$ $t = 13.96$ s ◀

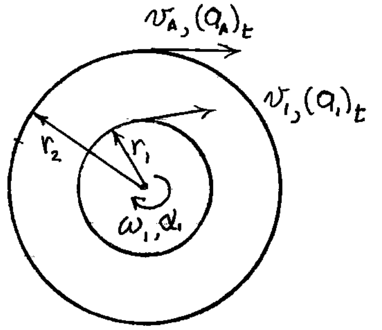
PROBLEM 15.23

Three belts move over two pulleys without slipping in the speed reduction system shown. At the instant shown the velocity of Point *A* on the input belt is 2 ft/s to the right, decreasing at the rate of 6 ft/s^2. Determine, at this instant, (*a*) the velocity and acceleration of Point *C* on the output belt, (*b*) the acceleration of Point *B* on the output pulley.

SOLUTION

Left pulley.



Inner radius $r_1 = 2$ in.

Outer radius $r_2 = 4$ in.

$$v_A = 2 \text{ ft/s} \longrightarrow$$

$$(a_A)_t = -6 \text{ ft/s}^2 = 6 \text{ ft/s}^2 \longleftarrow$$

$$\omega_1 = \frac{v_A}{r_2} = \frac{2}{\frac{4}{12}} = 6 \text{ rad/s} \circlearrowright$$

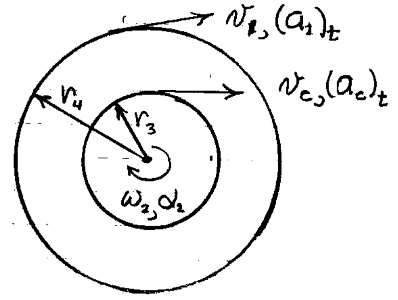
$$\alpha_1 = \frac{(a_A)_t}{r_2} = \frac{6}{\frac{4}{12}} = 18 \text{ rad/s}^2 \circlearrowleft$$

Intermediate belt.

$$v_1 = r_1\omega_1 = \left(\frac{2}{12}\right)(6) = 1 \text{ ft/s}$$

$$(a_1)_t = r_1\alpha_1 = \left(\frac{2}{12}\right)(18) = 3 \text{ ft/s}^2$$

Right pulley.



Inner radius $r_3 = 2$ in.

Outer radius $r_4 = 4$ in.

$$\omega_2 = \frac{v_1}{r_4} = \frac{1}{\left(\frac{4}{12}\right)} = 3 \text{ rad/s} \circlearrowright$$

$$\alpha_2 = \frac{(a_1)_t}{r_4} = \frac{3}{\left(\frac{4}{12}\right)} = 9 \text{ rad/s}^2 \circlearrowleft$$

PROBLEM 15.24

A gear reduction system consists of three gears A, B, and C. Knowing that gear A rotates clockwise with a constant angular velocity $\omega_A = 600$ rpm, determine (*a*) the angular velocities of gears B and C, (*b*) the accelerations of the points on gears B and C which are in contact.

SOLUTION

(*a*)
$$\omega_A = 600 \text{ rpm} = \frac{(600)(2\pi)}{60} = 20\pi \text{ rad/s.}$$

Let Points A, B, and C lie at the axles of gears A, B, and C, respectively.

Let D be the contact point between gears A and B.

$$v_D = r_{D/A}\omega_A = (2)(20\pi) = 40\pi \text{ in./s} \downarrow$$

$$\omega_B = \frac{v_D}{r_{D/B}} = \frac{40\pi}{4} = 10\pi \text{ rad/s} = 10\pi \cdot \frac{60}{2\pi} = 300 \text{ rpm} \circlearrowleft$$

$$\boldsymbol{\omega}_B = 300 \text{ rpm} \circlearrowleft \blacktriangleleft$$

Let E be the contact point between gears B and C.

$$v_E = r_{E/B}\omega_B = (2)(10\pi) = 20\pi \text{ in./s} \uparrow$$

$$\omega_C = \frac{v_E}{r_{E/C}} = \frac{20\pi}{6} = 3.333\pi \text{ rad/s} = (3.333\pi)\frac{60}{2\pi} = 100 \text{ rpm} \circlearrowright$$

$$\boldsymbol{\omega}_C = 100 \text{ rpm} \circlearrowright \blacktriangleleft$$

(*b*) *Accelerations at Point E.*

On gear B:
$$a_B = \frac{v_E^2}{r_{E/B}} = \frac{(20\pi)^2}{2} = 1973.9 \text{ in./s}^2 \longleftarrow$$

$$\mathbf{a}_B = 1974 \text{ in./s}^2 \longleftarrow \blacktriangleleft$$

On gear C:
$$a_C = \frac{v_E^2}{r_{E/C}} = \frac{(20\pi)^2}{6} = 658 \text{ in./s}^2 \longrightarrow$$

$$\mathbf{a}_C = 658 \text{ in./s}^2 \longrightarrow \blacktriangleleft$$

PROBLEM 15.28

A plastic film moves over two drums. During a 4-s interval the speed of the tape is increased uniformly from $v_0 = 2$ ft/s to $v_1 = 4$ ft/s. Knowing that the tape does not slip on the drums, determine (*a*) the angular acceleration of drum *B*, (*b*) the number of revolutions executed by drum *B* during the 4-s interval.

SOLUTION

Belt motion:

$$v = v_0 + at$$

$$4 \text{ ft/s} = 2 \text{ ft/s} + a(4 \text{ s})$$

$$a = \frac{4 \text{ ft/s} - 2 \text{ ft/s}}{4 \text{ s}} = 0.5 \text{ ft/s}^2 = 6 \text{ in./s}^2$$

Since the belt does not slip relative to the periphery of the drum, the tangential accelation at the periphery of the drum is

$$a_t = 6 \text{ in./s}^2$$

(*a*) *Angular acceleration of drum B.*

$$\alpha_B = \frac{a_t}{r_B} = \frac{6 \text{ in./s}^2}{15 \text{ in.}}$$

$\boldsymbol{\alpha}_B = 0.400 \text{ rad/s}^2$ ↻ ◀

(*b*) *Angular displacement of drum B.*

At $t = 0$, $\quad \omega_0 = \dfrac{v_0}{r_B} = \dfrac{24 \text{ in./s}}{15 \text{ in.}} = 1.6 \text{ rad/s}$

At $t = 4$ s, $\quad \omega_1 = \dfrac{v_1}{r_B} = \dfrac{48 \text{ in./s}}{15 \text{ in.}} = 3.2 \text{ rad/s}$

$$\omega_1^2 = \omega_0^2 + 2\alpha_B\theta_B$$

$$\theta_B = \frac{\omega_1^2 - \omega_0^2}{2\alpha_B} = \frac{(3.2)^2 - (1.6)^2}{(2)(0.400)} = 9.6 \text{ radians}$$

In revolutions, $\quad \theta_B = \dfrac{9.6}{2\pi}$

$\theta_B = 1.528$ rev ◀

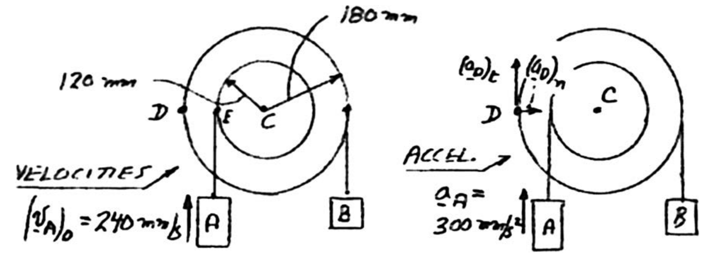
PROBLEM 15.29

A pulley and two loads are connected by inextensible cords as shown. Load A has a constant acceleration of 300 mm/s^2 and an initial velocity of 240 mm/s, both directed upward. Determine (a) the number of revolutions executed by the pulley in 3 s, (b) the velocity and position of load B after 3 s, (c) the acceleration of Point D on the rim of the pulley at $t = 0$.

SOLUTION



(a) Motion of pulley:

$$(\mathbf{v}_E)_0 = (v_A)_0 = 240 \text{ mm/s} \uparrow$$

$$(\mathbf{a}_E)_t = \mathbf{a}_A = 300 \text{ mm/s}^2 \uparrow$$

$$(v_E)_0 = r\omega_0: \quad 240 \text{ mm/s} = (120 \text{ mm})\omega_0 \qquad \boldsymbol{\omega}_0 = 2 \text{ rad/s} \circlearrowright$$

$$(a_E)_t = r\alpha: \quad 300 \text{ mm}^2\text{/s} = (120 \text{ mm})\alpha \qquad \boldsymbol{\alpha} = 2.5 \text{ rad/s}^2 \circlearrowright$$

For $t = 3$ s:

$$\omega = \omega_0 + \alpha t$$
$$= 2 \text{ rad/s} + (2.5 \text{ rad/s}^2)(3 \text{ s})$$
$$= 9.5 \text{ rad/s}$$

$$\theta = \omega_0 t + \frac{1}{2}\alpha t^2$$
$$= (2 \text{ rad/s})(3 \text{ s}) + \frac{1}{2}(2.5 \text{ rad/s}^2)(3 \text{ s})^2$$

$$\theta = 17.25 \text{ rad} \qquad \theta = 17.25\left(\frac{1}{2\pi}\right) \qquad \theta = 2.75 \text{ rev}$$ ◀

(b) Load B:

$$r = 180 \text{ mm}$$
$$t = 3 \text{ s}$$

$$v_B = r\omega = (0.180 \text{ m})(9.5 \text{ rad/s}) = 1.710 \text{ m/s} \qquad \mathbf{v}_B = 1.710 \text{ m/s} \downarrow$$ ◀

$$\Delta y_B = r\theta = (0.180 \text{ m})(17.25 \text{ rad}) = 3.105 \text{ m} \qquad \Delta y_B = 3.11 \text{ m} \downarrow$$ ◀

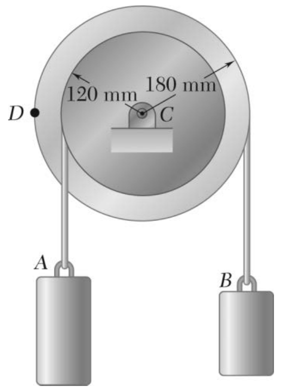
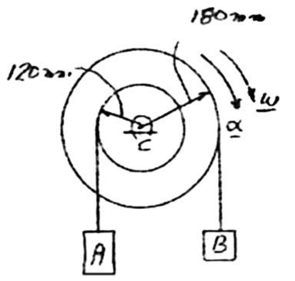
PROBLEM 15.30



A pulley and two loads are connected by inextensible cords as shown. The pulley starts from rest at $t = 0$ and is accelerated at the uniform rate of 2.4 rad/s^2 clockwise. At $t = 4$ s, determine the velocity and position (*a*) of load *A*, (*b*) of load *B*.

SOLUTION



Uniformly accelerated motion. $\omega_0 = 0$

$$\alpha = 2.4 \text{ rad/s}^2 \circlearrowright$$

At $t = 4$ s: $\omega = \omega_0 + \alpha t = 0 + (2.4 \text{ rad/s}^2)(4 \text{ s})$

$$\boldsymbol{\omega} = 9.6 \text{ rad/s}^2 \circlearrowright$$

$$\theta = \theta_0 + \omega_0 t + \frac{1}{2}\alpha t^2$$

$$= 0 + 0 + \frac{1}{2}(2.4 \text{ rad/s}^2)(4 \text{ s})^2$$

$$\theta = 19.20 \text{ rad} \circlearrowright$$

(*a*) Load *A*. At $t = 4$ s: $r_A = 120$ mm

$$v_A = r_A\omega$$
$$= (120 \text{ mm})(9.6 \text{ rad/s})$$
$$= 1152 \text{ mm/s}$$

$$\mathbf{v}_A = 1.152 \text{ m/s} \uparrow \blacktriangleleft$$

$$y_A = r_A\theta$$
$$= (120 \text{ mm})(19.2 \text{ rad})$$
$$= 2304 \text{ mm}$$

$$\mathbf{y}_A = 2.30 \text{ m} \uparrow \blacktriangleleft$$

(*b*) Load *B*. At $t = 4$ s: $r_B = 180$ mm

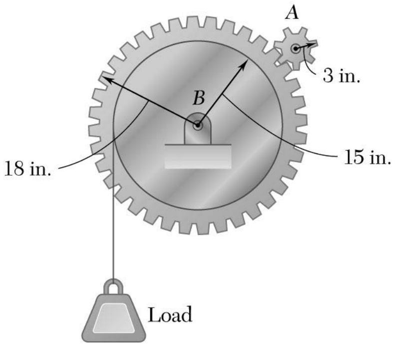
$$v_B = r_B\omega$$
$$= (180 \text{ mm})(9.6 \text{ rad/s})$$
$$= 1728 \text{ mm/s}$$

$$\mathbf{v}_B = 1.728 \text{ m/s} \downarrow \blacktriangleleft$$

$$y_B = r_B\theta$$
$$= (180 \text{ mm})(19.2 \text{ rad})$$
$$= 3456 \text{ mm}$$

$$\mathbf{y}_B = 3.46 \text{ m} \downarrow \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.31

A load is to be raised 20 ft by the hoisting system shown. Assuming gear *A* is initially at rest, accelerates uniformly to a speed of 120 rpm in 5 s, and then maintains a constant speed of 120 rpm, determine (*a*) the number of revolutions executed by gear *A* in raising the load, (*b*) the time required to raise the load.

SOLUTION

The load is raised a distance $h = 20$ ft $= 240$ in.

For gear-pulley *B*, radius to rope groove is $r_1 = 15$ in.

Required angle change for *B*: $\theta_B = \dfrac{h}{r_1} = \dfrac{240}{15} = 16 \text{ radians}$

Circumferential travel of gears *A* and *B*:

$$s = r_2\theta_B = r_A\theta_A \qquad \text{where } r_2 = 18 \text{ in. and } r_A = 3 \text{ in.}$$

$$s = (18 \text{ in.})(16 \text{ radians}) = 288 \text{ in.}$$

(*a*) *Angle change of gear A*: $\theta_A = \dfrac{s}{r_A} = \dfrac{288}{3} = 96 \text{ radians}$

In revolutions, $\theta_A = \dfrac{96}{2\pi}$ $\qquad \theta_A = 15.28 \text{ rev}$ ◀

(*b*) *Motion of gear A*. $\omega_0 = 0, \quad \omega_f = 120 \text{ rpm} = 4\pi \text{ rad/s}$

Gear *A* is uniformly accelerated over the first 5 seconds.

$$\alpha = \frac{\omega_f - \omega_0}{t} = \frac{4\pi \text{ rad/s}}{5 \text{ s}} = 2.5133 \text{ rad/s}^2$$

$$\theta_A = \frac{1}{2}\alpha t^2 = \frac{1}{2}(2.5133)(5)^2 = 31.416 \text{ radians}$$

The angle change over the constant speed phase is

$$\Delta\theta = \theta_A - \theta = 96 - 31.416 = 64.584 \text{ radians}$$

For uniform motion, $\Delta\theta = \omega_f(\Delta t)$

$$\Delta t = \frac{\Delta\theta}{\omega_f} = \frac{64.584}{4\pi} = 5.139 \text{ s}$$

Total time elapsed: $t_f = 5 \text{ s} + \Delta t$ $\qquad t_f = 10.14 \text{ s}$ ◀

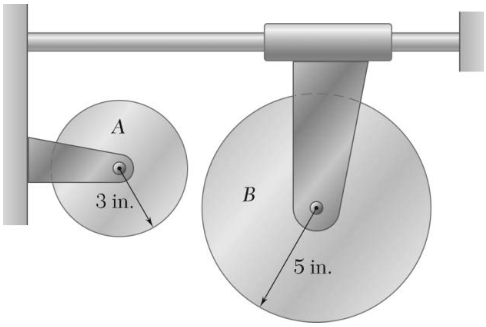
PROBLEM 15.32



Disk B is at rest when it is brought into contact with disk A which is rotating freely at 450 rpm clockwise. After 6 s of slippage, during which each disk has a constant angular acceleration, disk A reaches a final angular velocity of 140 rpm clockwise. Determine the angular acceleration of each disk during the period of slippage.

SOLUTION

Disk A: $(\omega_A)_0 = 450 \text{ rpm} = 47.124 \text{ rad/s} \curvearrowright$

When $t = 6$ s: $\boldsymbol{\omega}_A = 140 \text{ rpm} = 14.661 \text{ rad/s} \curvearrowright$

$$\omega_A = (\omega_A)_0 + \alpha_A t$$

$$14.661 \text{ rad/s} = 47.124 \text{ rad/s} + \alpha_A (6 \text{ s})$$

$$\alpha_A = -5.41 \text{ rad/s}$$

$\boldsymbol{\alpha}_A = 5.41 \text{ rad/s}^2 \curvearrowleft$ ◀

Disk B: $\omega_0 = 0$

When $t = 6$ s: (end of slippage)

$+\downarrow\; r_A\omega_A = r_B\omega_B$: $(3 \text{ in.})(14.661 \text{ rad/s}) = (5 \text{ in.})(\omega_B)$

$$\omega_B = 8.796 \text{ rad/s} \curvearrowleft$$

$$\omega_B = (\omega_B)_0 + \alpha_B t$$

$$8.796 \text{ rad/s} = 0 + \alpha_B (6 \text{ s})$$

$$\alpha_B = 1.466 \text{ rad/s}^2$$

$\boldsymbol{\alpha}_B = 1.466 \text{ rad/s}^2 \curvearrowleft$ ◀

PROBLEM 15.33

A simple friction drive consists of two disks *A* and *B*. Initially, disk *A* has a clockwise angular velocity of 500 rpm and disk *B* is at rest. It is known that disk *A* will coast to rest in 60 s. However, rather than waiting until both disks are at rest to bring them together, disk *B* is given a constant angular acceleration of 2.5 rad/s² counterclockwise. Determine (*a*) at what time the disks can be brought together if they are not to slip, (*b*) the angular velocity of each disk as contact is made.

SOLUTION

Disk *A*: $(\omega_A)_0 = 500 \text{ rpm} = 52.36 \text{ rad/s} \curvearrowright$

Disk *A* will coast to rest in 60 s.

$$\omega_A = (\omega_A)_0 + \alpha_A t; \quad 0 = 52.36 \text{ rad/s} + \alpha_A (60 \text{ s})$$

$$\alpha_A = -0.87266 \text{ rad/s}^2$$

At time *t*:

$$\omega_A = (\omega_A)_0 + \alpha_A t$$

$$\omega_A = 52.36 - 0.87266t \qquad (1)$$

Disk *B*: $\alpha_B = 2.5 \text{ rad/s}^2 \quad (\omega_B)_0 = 0$

At time *t*: $\omega_B = (\omega_B)_0 + \alpha_B t; \quad \omega_B = 2.5t \qquad (2)$

(*a*) Bring disks together when: $r_A \omega_A = r_B \omega_B$

$$(3 \text{ in.})(52.36 - 0.87266t) = (5 \text{ in.})(2.5t)$$

$$157.08 - 2.618t = 12.5t$$

$$157.08 = 15.118t$$

$t = 10.39 \text{ s}$ ◀

(*b*) When contact is made $(t = 10.39 \text{ s})$

Eq. (1): $\omega_A = 52.36 - 0.87266(10.39)$

$\omega_A = 43.29 \text{ rad/s}$ $\quad \boldsymbol{\omega}_A = 413 \text{ rpm} \curvearrowright$ ◀

Eq. (2): $\omega_B = 2.5(10.39)$

$\omega_B = 25.975 \text{ rad/s}$ $\quad \boldsymbol{\omega}_B = 248 \text{ rpm} \curvearrowleft$ ◀

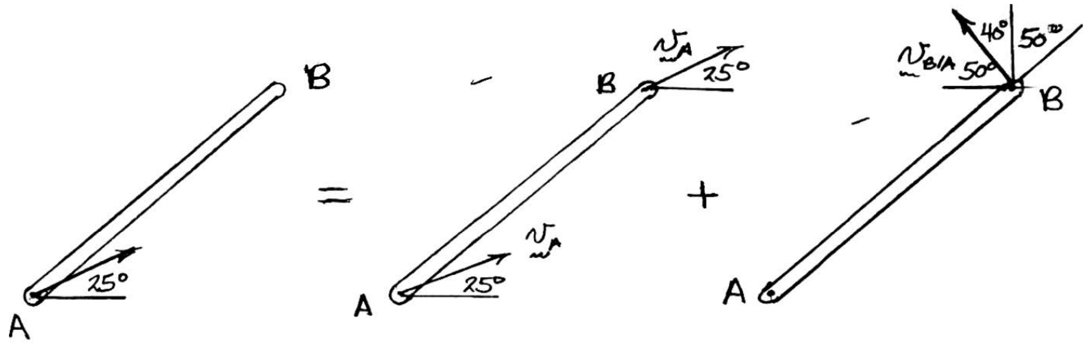
PROBLEM 15.40

Collar B moves upward with a constant velocity of 1.5 m/s. At the instant when $\theta = 50°$, determine (*a*) the angular velocity of rod AB, (*b*) the velocity of end A of the rod.

SOLUTION

Draw a diagram showing the motion of rod AB.

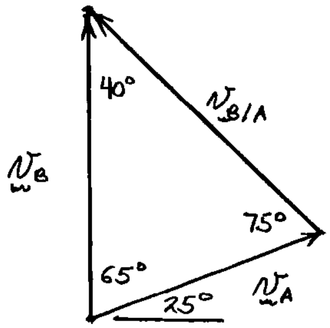


Plane motion = Translation + Rotation

$\mathbf{v}_A = v_A \measuredangle 25°$ $\qquad \mathbf{v}_B = 1.5 \text{ m/s}\uparrow$ $\qquad \mathbf{v}_{B/A} = v_{B/A} \searrow 50°$

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$$

$$[1.5 \text{ m/s}\uparrow] = [v_A \measuredangle 25°] + [v_{B/A} \searrow 50°]$$



Draw the velocity vector diagram.

Interior angles of the triangle.

$$90° - 25° = 65°$$
$$90° - 50° = 40°$$
$$25° + 50° = 75°$$

Law of sines.

$v_B = 1.5$ m/s

$$\frac{v_B}{\sin 75°} = \frac{v_A}{\sin 40°} = \frac{v_{B/A}}{\sin 65°}$$

PROBLEM 15.43

Rod AB moves over a small wheel at C while end A moves to the right with a constant velocity of 25 in./s. At the instant shown, determine (*a*) the angular velocity of the rod, (*b*) the velocity of end B of the rod.

SOLUTION

Slope angle of rod. $\tan\theta = \frac{7}{10} = 0.7,\qquad \theta = 35°$

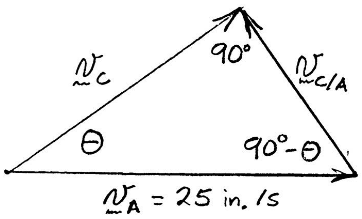
$$\overline{AC} = \frac{10}{\cos\theta} = 12.2066 \text{ in.}\qquad \overline{CB} = 20 - \overline{AC} = 7.7934 \text{ in.}$$

Velocity analysis.

$$\mathbf{v}_A = 25 \text{ in./s} \longrightarrow,\qquad \mathbf{v}_C = v_C \measuredangle\, \theta$$

$$\mathbf{v}_{C/A} = \overline{AC}\omega_{AB} \searrow \theta$$

$$\mathbf{v}_C = \mathbf{v}_A + v_{C/A}$$



Draw corresponding vector diagram.

$$v_{C/A} = v_A \sin\theta = 25\sin 35° = 14.34 \text{ in./s}$$

(*a*) $\omega_{AB} = \frac{v_{C/A}}{AC} = \frac{14.34}{12.2066} = 1.175 \text{ rad/s}$

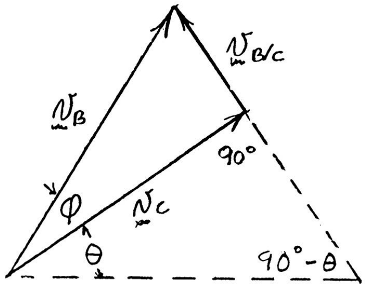
$$\boldsymbol{\omega}_{AB} = 1.175 \text{ rad/s} \circlearrowleft \blacktriangleleft$$

$$v_C = v_A\cos\theta = 25\cos\theta = 20.479 \text{ in./s}$$

$$v_{B/C} = \overline{CB}\omega_{AB} = (7.7934)(1.175) = 9.1551 \text{ in./s}$$

$v_{B/C}$ has same direction as $v_{C/A}$.

$$\mathbf{v}_B = \mathbf{v}_C + \mathbf{v}_{B/C}$$



Draw corresponding vector diagram.

$$\tan\phi = \frac{v_{B/C}}{v_C} = \frac{9.1551}{20.479},\quad \phi = 24.09°$$

(*b*) $v_B = \frac{v_C}{\cos\phi} = \frac{20.479}{\cos 24.09°} = 22.4 \text{ in./s} = 1.869 \text{ ft/s}$

$$\phi + \theta = 59.1°$$

$$\mathbf{v}_B = 1.869 \text{ ft/s} \measuredangle\, 59.1° \blacktriangleleft$$

PROBLEM 15.44

The plate shown moves in the xy plane. Knowing that $(v_A)_x = 120$ mm/s, $(v_B)_y = 300$ mm/s, and $(v_C)_y = -60$ mm/s, determine (*a*) the angular velocity of the plate, (*b*) the velocity of Point A.

SOLUTION

$$\mathbf{r}_{C/B} = (180\text{ mm})\mathbf{i} + (360\text{ mm})\mathbf{j}$$

$$\boldsymbol{\omega} = \omega\mathbf{k}$$

$$\mathbf{v}_B = (v_B)_x\mathbf{i} + (300\text{ mm/s})\mathbf{j}$$

$$\mathbf{v}_C = (v_C)_x\mathbf{i} - (60\text{ mm/s})\mathbf{j}$$

(*a*)

$$\mathbf{v}_C = \mathbf{v}_B + \mathbf{v}_{C/B}$$

$$(v_C)_x\mathbf{i} - (60\text{ mm/s})\mathbf{j} = (v_B)_x\mathbf{i} + (300\text{ mm/s})\mathbf{j} + \boldsymbol{\omega}\times\mathbf{r}_{C/B}$$

$$(v_C)_x\mathbf{i} - 60\mathbf{j} = (v_B)_x\mathbf{i} + 300\mathbf{j} + \omega\mathbf{k}\times(180\mathbf{i} + 360\mathbf{j})$$

$$(v_C)_x\mathbf{i} - 60\mathbf{j} = (v_B)_x\mathbf{i} + 300\mathbf{j} + 180\omega\mathbf{j} - 360\omega\mathbf{i}$$

Coefficients of $\mathbf{j}$: $-60 = 300 + 180\omega$

$\omega = -2$ rad/s $\qquad \boldsymbol{\omega} = 2$ rad/s ↻ ◀

(*b*) Velocity of A: $\mathbf{r}_{A/B} = -(180\text{ mm})\mathbf{i} + (180\text{ mm})\mathbf{j}$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B} = \mathbf{v}_B + \boldsymbol{\omega}\times\mathbf{r}_{A/B}$$

$$120\mathbf{i} + (v_A)_y\mathbf{j} = (v_B)_x\mathbf{i} + 300\mathbf{j} + (-2\mathbf{k})\times(-180\mathbf{i} + 180\mathbf{j})$$

$$120\mathbf{i} + (v_A)_y\mathbf{j} = (v_B)_x\mathbf{i} + 300\mathbf{j} + 360\mathbf{j} + 360\mathbf{i}$$

Coefficients of $\mathbf{j}$: $(v_A)_y = 300 + 360 = 660$ mm/s

$\mathbf{v}_A = (120\text{ mm/s})\mathbf{i} + (660\text{ mm/s})\mathbf{j}$ ◀

PROBLEM 15.45

In Problem 15.44, determine (*a*) the velocity of Point *B*, (*b*) the point of the plate with zero velocity.

PROBLEM 15.44 The plate shown moves in the *xy* plane. Knowing that $(v_A)_x = 120$ mm/s, $(v_B)_y = 300$ mm/s, and $(v_C)_y = -60$ mm/s, determine (*a*) the angular velocity of the plate, (*b*) the velocity of Point *A*.

SOLUTION

$$\mathbf{r}_{B/A} = (180\text{ mm})\mathbf{i} - (180\text{ mm})\mathbf{j}$$

From the answer of Problem 15.44, we have

$$\boldsymbol{\omega} = -(2\text{ rad/s})\mathbf{k}$$
$$\mathbf{v}_A = (120\text{ mm/s})\mathbf{i} + (660\text{ mm/s})\mathbf{j}$$

(*a*) *Velocity of B*:

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} = \mathbf{v}_A + \boldsymbol{\omega}\times\mathbf{r}_{B/A}$$
$$= 120\mathbf{i} + 660\mathbf{j} - 2\mathbf{k}\times(180\mathbf{i} - 180\mathbf{j})$$
$$= 120\mathbf{i} + 660\mathbf{j} - 360\mathbf{j} - 360\mathbf{i}$$

$$\mathbf{v}_B = -(240\text{ mm/s})\mathbf{i} + (300\text{ mm/s})\mathbf{j} \blacktriangleleft$$

(*b*) *Point with* $v = 0$:

Let $\mathbf{P} = x\mathbf{i} + y\mathbf{j}$ be an arbitrary point.

Thus $\mathbf{r}_{P/A} = (180 + x)\mathbf{i} + y\mathbf{j}$

$$\mathbf{v}_P = \mathbf{v}_A + \mathbf{v}_{P/A} = \mathbf{v}_A + \boldsymbol{\omega}\times\mathbf{r}_{P/A}$$
$$\mathbf{v}_P = 120\mathbf{i} + 660\mathbf{j} + (-2\mathbf{k})\times[(180 + x)\mathbf{i} + y\mathbf{j}]$$
$$\mathbf{v}_P = 120\mathbf{i} + 660\mathbf{j} - (360 + 2x)\mathbf{j} + 2y\mathbf{i}$$
$$\mathbf{v}_P = (120 + 2y)\mathbf{i} + (300 - 2x)\mathbf{j}$$

For $\mathbf{v}_P = 0$: $\quad 120 + 2y = 0 \quad \text{and} \quad 300 - 2x = 0$

$\mathbf{v} = 0$ at: $\quad y = -60\text{ mm}, \quad x = 150\text{ mm} \blacktriangleleft$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 15.46

The plate shown moves in the xy plane. Knowing that $(v_A)_x = 250$ mm/s, $(v_B)_x = -450$ mm/s, and $(v_C)_x = -500$ mm/s, determine (*a*) the angular velocity of the plate, (*b*) the velocity of Point A.

SOLUTION

Angular velocity: $\boldsymbol{\omega} = \omega\mathbf{k}$

Relative position vectors: $\mathbf{r}_{B/A} = (150 \text{ mm})\mathbf{i}$

$$\mathbf{r}_{C/A} = (200 \text{ mm})\mathbf{i} + (150 \text{ mm})\mathbf{j}$$

Velocity vectors: $\mathbf{v}_A = (250 \text{ mm/s})\mathbf{i} + (v_A)_y\mathbf{j}$

$$\mathbf{v}_B = (v_B)_x\mathbf{i} - (450 \text{ mm/s})\mathbf{j}$$

$$\mathbf{v}_C = -(500 \text{ mm/s})\mathbf{i} + (v_C)_y\mathbf{j}$$

Unknowns are ω, $(v_A)_y$, $(v_B)_x$, and $(v_C)_y$.

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} = \mathbf{v}_A + \omega\mathbf{k} \times \mathbf{r}_{B/A}$$

$$(v_B)_x\mathbf{i} - 450\mathbf{j} = 250\mathbf{i} + (v_A)_y\mathbf{j} + \omega\mathbf{k} \times 150\mathbf{i}$$

$$= 250\mathbf{i} + (v_A)_y\mathbf{j} + 150\omega\mathbf{j}$$

i: $(v_B)_x = 250$ (1)

j: $-450 = (v_A)_y + 150\omega$ (2)

$$\mathbf{v}_C = \mathbf{v}_A + \mathbf{v}_{C/A} = \mathbf{v}_A + \omega\mathbf{k} \times \mathbf{r}_{C/A}$$

$$-500\mathbf{i} + (v_C)_y\mathbf{j} = 250\mathbf{i} + (v_A)_y\mathbf{j} + \omega\mathbf{k} \times (200\mathbf{i} - 150\mathbf{j})$$

$$= 250\mathbf{i} + (v_A)_y\mathbf{j} + 200\omega\mathbf{j} + 150\omega\mathbf{i}$$

i: $-500 = 250 + 150\omega$ (3)

j: $(v_C)_y = (v_A)_y + 150\omega$ (4)

(*a*) *Angular velocity of the plate.*

From Eq. (3), $\omega = -\dfrac{750}{150} = -5$

$$\boldsymbol{\omega} = -(5.00 \text{ rad/s})\mathbf{k} = 5.00 \text{ rad/s} \circlearrowright \blacktriangleleft$$

(*b*) *Velocity of Point A.*

From Eq. (2), $(v_A)_y = -450 - 150\omega = -450 - (150)(-5) = 300$ mm/s

$$\mathbf{v}_A = (250 \text{ mm/s})\mathbf{i} + (300 \text{ mm/s})\mathbf{j} \blacktriangleleft$$

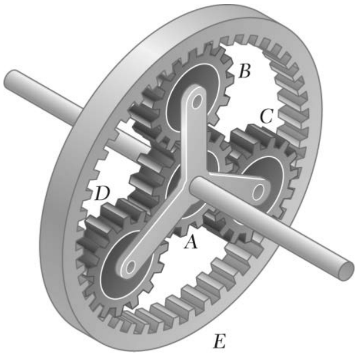
PROBLEM 15.48

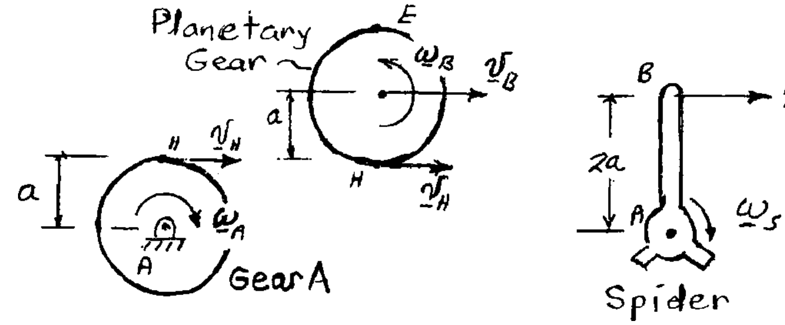


In the planetary gear system shown, the radius of gears A, B, C, and D is a and the radius of the outer gear E is $3a$. Knowing that the angular velocity of gear A is ω_A clockwise and that the outer gear E is stationary, determine (*a*) the angular velocity of each planetary gear, (*b*) the angular velocity of the spider connecting the planetary gears.

SOLUTION

Gear E is stationary. $\quad v_E = 0$

Let A be the center of gear A and the spider. Since the motions of gears B, C, and D are similar, only gear B is considered. Let H be the effective contact point between gears A and B.



Gear A: $\quad \mathbf{v}_H = a\omega_A \longrightarrow$

(*a*) *Planetary gears B, C, and D*: $\quad \mathbf{v}_H = \mathbf{v}_E + \mathbf{v}_{H/E}$

$$+\!\longrightarrow: a\omega_A = 0 + (2a)\omega_B \qquad \omega_B = \frac{1}{2}\omega_A$$

$$\boldsymbol{\omega}_B = \boldsymbol{\omega}_C = \boldsymbol{\omega}_D = \frac{1}{2}\omega_A \curvearrowright \blacktriangleleft$$

$$\mathbf{v}_B = \mathbf{v}_E + \mathbf{v}_{B/E}$$

$$+\!\longrightarrow: v_B = 0 + a\left(\frac{1}{2}\omega_A\right) \qquad \mathbf{v}_B = \frac{1}{2}a\omega_A \longrightarrow \tag{1}$$

(*b*) *Spider*. $\quad \mathbf{v}_B = (2a)\omega_s \longrightarrow \quad (2)$

Equating expressions (1) and (2) for $\mathbf{v}_B$,

$$\frac{1}{2}a\omega_A = (2a)\omega_s \qquad \omega_s = \frac{1}{4}\omega_A \qquad \boldsymbol{\omega}_s = \frac{1}{4}\omega_A \curvearrowright \blacktriangleleft$$

PROBLEM 15.51

In the simplified sketch of a ball bearing shown, the diameter of the inner race A is 60 mm and the diameter of each ball is 12 mm. The outer race B is stationary while the inner race has an angular velocity of 3600 rpm. Determine (*a*) the speed of the center of each ball, (*b*) the angular velocity of each ball, (*c*) the number of times per minute each ball describes a complete circle.

SOLUTION

Data: $\omega_A = 3600 \text{ rpm} = 376.99 \text{ rad/s}, \quad \omega_B = 0$

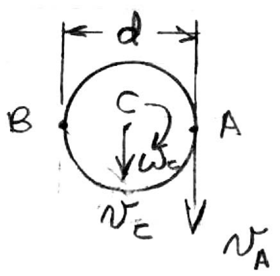
$$r_A = \frac{1}{2} d_A = 30 \text{ mm}$$

$$d = \text{diameter of ball} = 12 \text{ mm}$$

Velocity of point on inner race in contact with a ball.

$$v_A = r_A \omega_A = (30)(376.99) = 11310 \text{ mm/s}$$

Consider a ball with its center at Point C.



$$v_A = v_B + v_{A/B}$$

$$v_A = 0 + \omega_C d$$

$$\omega_C = \frac{v_A}{d} = \frac{11310}{12}$$

$$= 942.48 \text{ rad/s}$$

$$v_C = v_B + v_{C/B}$$

$$= 0 + \frac{1}{2} d\omega = (6)(942.48) = 5654.9 \text{ mm/s}$$

(*a*) $v_C = 5.65 \text{ m/s}$ ◀

(*b*) Angular velocity of ball.

$$\omega_C = 942.48 \text{ rad/s}$$

$\omega_C = 9000 \text{ rpm}$ ◀

(*c*) Distance traveled by center of ball in 1 minute.

$$l_C = v_C t = 5654.9(60) = 339290 \text{ mm}$$

Circumference of circle: $2\pi r = 2\pi(30+6)$

$$= 226.19 \text{ mm}$$

Number of circles completed in 1 minute:

$$n = \frac{l}{2\pi r} = \frac{339290}{226.19}$$

$n = 1500$ ◀

PROBLEM 15.52

A simplified gear system for a mechanical watch is shown. Knowing that gear A has a constant angular velocity of 1 rev/h and gear C has a constant angular velocity of 1 rpm, determine (*a*) the radius r, (*b*) the magnitudes of the accelerations of the points on gear B that are in contact with gears A and C.

SOLUTION

Point where A contacts B:

$$v_1 = r_A\omega_A = r\omega_B \qquad \omega_B = \frac{r_A\omega_A}{r} \qquad (1)$$

Point where B contacts C:

$$v_2 = r_B\omega_B = r\omega_C \qquad \omega_C = \frac{r_B}{r}\omega_B \qquad (2)$$

From Eqs. (1) and (2),

$$\omega_C = \frac{r_A r_B}{r^2}\omega_A$$

$$r^2 = r_A r_B \frac{\omega_A}{\omega_C}$$

Data:

$$r_A = 0.6 \text{ in.}, \quad r_B = 0.36 \text{ in.} \quad \frac{\omega_A}{\omega_C} = \frac{1 \text{ rev/h}}{1 \text{ rev/m}} = \frac{1}{60}$$

$$r^2 = \frac{(0.6 \text{ in.})(0.36 \text{ in.})}{60} = 0.0036 \text{ in}^2$$

(*a*) *Radius r*:

$$r = 0.0600 \text{ in.} \blacktriangleleft$$

Angular velocity of B.

$$\omega_C = 1 \text{ rpm} = \frac{2\pi}{60} \text{ rad/s}$$

$$\omega_B = \frac{r}{r_B}\omega_C = \frac{0.060}{0.36}\frac{2\pi}{60} = 0.017453 \text{ rad/s}$$

(*b*) *Point where B contacts A.*

$$a_n = r\omega_B^2 = (0.0600 \text{ in.})(0.017453 \text{ rad/s})^2$$

$$a_n = 18.28 \times 10^{-6} \text{ in./s}^2 \blacktriangleleft$$

Point where B contacts C.

$$a_n = r_B\omega_B^2 = (0.36 \text{ in.})(0.017453 \text{ rad/s})^2$$

$$a_n = 109.7 \times 10^{-6} \text{ in./s}^2 \blacktriangleleft$$

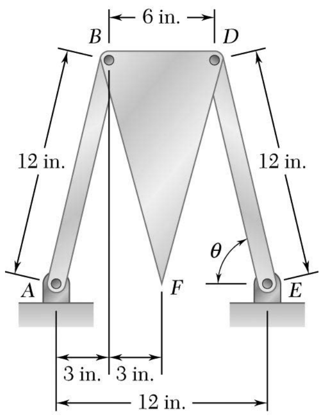
PROBLEM 15.66



Robert's linkage is named after Richard Robert (1789–1864) and can be used to draw a close approximation to a straight line by locating a pen at Point F. The distance AB is the same as BF, DF and DE. Knowing that the angular velocity of bar AB is 5 rad/s clockwise in the position shown, determine (*a*) the angular velocity of bar DE, (*b*) the velocity of Point F.

SOLUTION

Bar AB: $\boldsymbol{\omega}_{AB} = 5 \text{ rad/s} \circlearrowright = -(5 \text{ rad/s})\mathbf{k}$

In inches,

$$\mathbf{r}_{B/A} = 3\mathbf{i} + \sqrt{12^2 - 3^2}\,\mathbf{j} = 3\mathbf{i} + \sqrt{135}\,\mathbf{j}$$

$$\mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A} = -5\mathbf{k} \times (3\mathbf{i} + \sqrt{135}\,\mathbf{j})$$

$$= 5\sqrt{135}\,\mathbf{i} - 15\mathbf{j}$$

Object BDF: $\mathbf{r}_{D/B} = (6 \text{ in.})\mathbf{i}, \quad \mathbf{r}_{F/B} = 3\mathbf{i} - \sqrt{135}\,\mathbf{j} \text{ (in.)}, \quad \boldsymbol{\omega}_{BD} = \omega_{BD}\mathbf{k}$

$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{B/D} = \mathbf{v}_B + \omega_{BD}\mathbf{k} \times \mathbf{r}_{D/B}$$

$$= 5\sqrt{135}\,\mathbf{i} - 15\mathbf{j} + \omega_{BD}\mathbf{k} \times 6\mathbf{i}$$

$$= 5\sqrt{135}\,\mathbf{i} - 15\mathbf{j} + 6\omega_{BD}\mathbf{j} \tag{1}$$

Bar DE: $\boldsymbol{\omega}_{DE} = \omega_{DE}\mathbf{k}, \quad \mathbf{r}_{D/E} = -(3 \text{ in.})\mathbf{i} + (\sqrt{135} \text{ in.})\mathbf{j},$

Point E is fixed so $\mathbf{v}_E = 0$

$$\mathbf{v}_D = \boldsymbol{\omega}_{DE} \times \mathbf{r}_{D/E} = \omega_{DE}\mathbf{k} \times (-3\mathbf{i} + \sqrt{135}\,\mathbf{j})$$

$$= -\sqrt{135}\,\omega_{DE}\mathbf{i} - 3\omega_{DE}\mathbf{j} \tag{2}$$

Equating like components of $\mathbf{v}_D$ from Eqs. (1) and (2),

i: $$5\sqrt{135} = -\sqrt{135}\,\omega_{DE} \tag{3}$$

j: $$-15 + 6\omega_{BD} = -3\omega_{DE} \tag{4}$$

(*a*) *Angular velocity of bar DE.*

From Eq. (3), $\omega_{DE} = -5 \text{ rad/s}$ $\qquad \boldsymbol{\omega}_{DE} = 5.00 \text{ rad/s} \circlearrowright$ ◀

From Eq. (4), $\omega_{BD} = \dfrac{1}{6}(15 - 3\omega_{DE}) = \dfrac{1}{6}(15 + 15)$ $\qquad \boldsymbol{\omega}_{BD} = 5.00 \text{ rad/s} \circlearrowleft$

PROBLEM 15.66 (Continued)

(*b*) *Velocity of Point F.* $\mathbf{v}_{F/B} = 3i - \sqrt{135}\mathbf{j}$

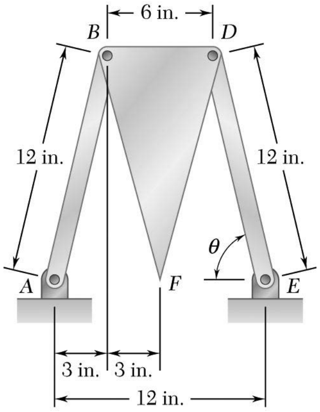
$$\mathbf{v}_F = \mathbf{v}_B = \mathbf{v}_{F/B} = \mathbf{v}_B + \omega_{BD}\mathbf{k} \times \mathbf{r}_{F/B}$$

$$= 5\sqrt{135}\mathbf{i} - 15\mathbf{j} + 5\mathbf{k} \times (3\mathbf{i} - \sqrt{135}\mathbf{j})$$

$$= 5\sqrt{135}\mathbf{i} - 15\mathbf{j} + 15\mathbf{j} + 5\sqrt{135}\mathbf{i} = 10\sqrt{135}\mathbf{i}$$

$\mathbf{v}_F = 116.2$ in./s $\longrightarrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

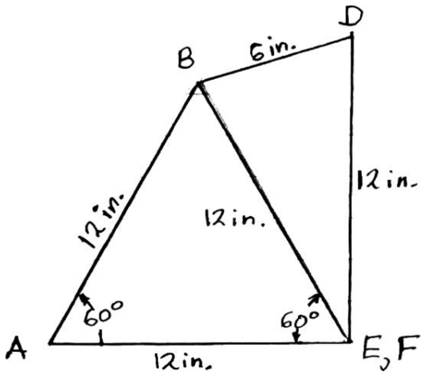


PROBLEM 15.67

Robert's linkage is named after Richard Robert (1789–1864) and can be used to draw a close approximation to a straight line by locating a pen at Point F. The distance AB is the same as BF, DF and DE. Knowing that the angular velocity of plate BDF is 2 rad/s counterclockwise when $\theta = 90°$, determine (*a*) the angular velocities of bars AB and DE, (*b*) the velocity of Point F. When $\theta = 90°$, determine (*a*) the angular velocity of bar **DE** (*b*) the velocity of Point **F**.

SOLUTION

When $\theta = 90°$, the configuration of the linkage is close to that shown at the right.



Bar AB: $\quad \boldsymbol{\omega}_{AB} = \omega_{AB}\mathbf{k}$

In inches, $\quad \mathbf{r}_{B/A} = 6\mathbf{i} + 6\sqrt{3}\mathbf{j}$

$$\mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A} = \omega_{AB}\mathbf{k} \times (6\mathbf{i} + 6\sqrt{3}\mathbf{j}) = -6\sqrt{3}\omega_{AB}\mathbf{i} + 6\omega_{AB}\mathbf{j}$$

Object BDF: $\quad \mathbf{r}_{D/B} = 6\mathbf{i} + 6(2-\sqrt{3})\mathbf{j}$

$$\mathbf{r}_{F/B} = 6\mathbf{i} - 6\sqrt{3}\mathbf{j} \qquad \boldsymbol{\omega}_{BD} = (2 \text{ rad/s})\mathbf{k}$$

$$\begin{aligned} \mathbf{v}_D &= \mathbf{v}_B + \mathbf{v}_{D/B} = \mathbf{v}_B = \omega_{BD}\mathbf{k} \times \mathbf{r}_{D/B} \\ &= -6\sqrt{3}\omega_{AB}\mathbf{i} + 6\omega_{AB}\mathbf{j} + 2\mathbf{k} \times [6\mathbf{i} + 6(2-\sqrt{3})\mathbf{j}] \\ &= -6\sqrt{3}\omega_{AB}\mathbf{i} + 6\omega_{AB}\mathbf{j} + 24\mathbf{i} - 12\sqrt{3}\mathbf{i} + 12\mathbf{j} \qquad (1) \end{aligned}$$

Bar DE: $\quad \boldsymbol{\omega}_{DE} = \omega_{DE}\mathbf{k}, \qquad \mathbf{r}_{D/E} = 12\mathbf{j}$

$$\mathbf{v}_D = \boldsymbol{\omega}_{DE} \times \mathbf{r}_{D/E} = \omega_{DE}\mathbf{k} \times 12\mathbf{j} = -12\omega_{DE}\mathbf{i} \qquad (2)$$

Equating like components of $\mathbf{v}_D$ from Eqs. (1) and (2),

i: $\quad -6\sqrt{3}\omega_{AB} + 12 - 6\sqrt{3} = -12\omega_{DE} \qquad (3)$

j: $\quad 6\omega_{AB} + 12 = 0$

$$\omega_{AB} = -2 \text{ rad/s} \qquad \omega_{AB} = 2.00 \text{ rad/s} \circlearrowright \blacktriangleleft$$

From Eq. (3), $\quad -12\omega_{DE} = -(6\sqrt{3})(-2) + 24 - 12\sqrt{3}$

$$\omega_{DE} = 2 - 2\sqrt{3} = -1.4641 \qquad \boldsymbol{\omega}_{DE} = 1.464 \text{ rad/s} \circlearrowright \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

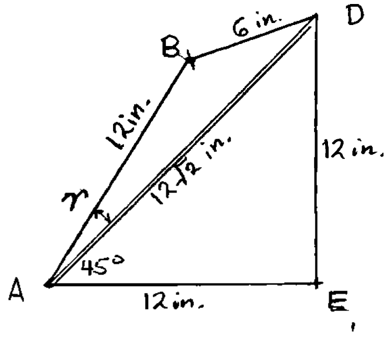
$$\mathbf{v}_D = -(12)(-1.4641)\mathbf{i} = 17.569\mathbf{i}$$

$$\mathbf{v}_F = \mathbf{v}_D + \omega_{BD}\mathbf{k} \times \mathbf{r}_{F/D}$$

$$= 17.569\mathbf{i} + 2\mathbf{k} \times (-12\mathbf{j}) = (41.569 \text{ in./s})\mathbf{i}$$

$$\mathbf{v}_F = 41.6 \text{ in./s} \longrightarrow \blacktriangleleft$$

Note: The exact configuration of the linkage when $\theta = 90°$ may be calculated from trigonometry using the figure given below.



Applying the law of cosines to triangle ADB gives

$$\gamma = 13.5°$$

so that angle EAB is

$$45° + 13.5° = 58.5°.$$

We used 60° in the approximate analysis.

Point F then lies about 0.53 in. to the right of Point E.

If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.70

Both 6-in.-radius wheels roll without slipping on the horizontal surface. Knowing that the distance *AD* is 5 in., the distance *BE* is 4 in. and *D* has a velocity of 6 in./s to the right, determine the velocity of Point *E*.

SOLUTION

Disk *D*: Velocity at the contact Point *P* with the ground is zero.

$$\mathbf{v}_0 = 6 \text{ in./s} \longrightarrow$$

$$\omega_D = \frac{v_D}{r_{D/P}} = \frac{6 \text{ in./s}}{6 \text{ in.}} = 1 \text{ rad/s} \qquad \boldsymbol{\omega}_D = 1 \text{ rad/s} \circlearrowright$$

At Point *A*, $v_A = r_{A/P}\omega_D = (6 \text{ in.} + 5 \text{ in.})(1 \text{ rad/s}) = 11 \text{ in./s}$

$$\mathbf{v}_A = 11 \text{ in./s} \longrightarrow$$

Disk *E*: Velocity at the contact Point *Q* with the ground is zero. $\boldsymbol{\omega}_E = \omega_E \circlearrowleft = \omega_E \mathbf{k}$.

$$\mathbf{r}_{B/Q} = -(4 \text{ in.})\mathbf{i} + (6 \text{ in.})\mathbf{j}$$

$$\mathbf{v}_B = \mathbf{v}_{B/Q} = \boldsymbol{\omega}_E \times \mathbf{r}_{B/Q} = \omega_E \mathbf{k} \times (-4\mathbf{i} + 6\mathbf{j})$$

$$\mathbf{v}_B = -6\omega_E \mathbf{i} - 4\omega_E \mathbf{j} \qquad (1)$$

Connecting rod *AB*: $\mathbf{r}_{B/A} = (\sqrt{14^2 - 5^2})\mathbf{i} - 5\mathbf{j}$ in inches.

$$\mathbf{v}_{B/A} = \sqrt{171}\mathbf{i} - 5\mathbf{j} \qquad \boldsymbol{\omega}_{AB} = \omega_{AB}\mathbf{k}$$

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} = \mathbf{v}_A + \omega_{AB}\mathbf{k} \times (\sqrt{171}\mathbf{i} - 5\mathbf{j})$$

$$= 11\mathbf{i} + 5\omega_{AB}\mathbf{i} + \sqrt{171}\omega_{AB}\mathbf{j} \qquad (2)$$

Equating expressions (1) and (2) for $\mathbf{v}_B$ gives

$$-6\omega_E \mathbf{i} - 4\omega_E \mathbf{j} = 11\mathbf{i} + 5\omega_{AB}\mathbf{i} + \sqrt{171}\omega_{AB}\mathbf{j}$$

Equating like components and transposing terms,

$$\mathbf{i}: \quad 5\omega_{AB} + 6\omega_E = -11 \qquad (3)$$

$$\mathbf{j}: \quad \sqrt{171}\omega_{AB} + 4\omega_E = 0 \qquad (4)$$

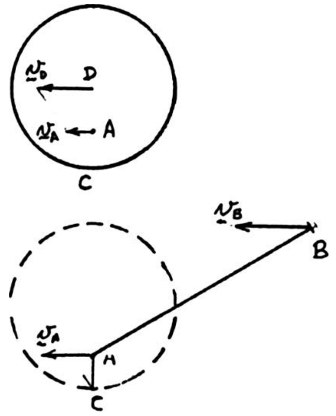
PROBLEM 15.71

The 80-mm-radius wheel shown rolls to the left with a velocity of 900 mm/s. Knowing that the distance AD is 50 mm, determine the velocity of the collar and the angular velocity of rod AB when (*a*) $\beta = 0$, (*b*) $\beta = 90°$.

SOLUTION

(*a*) $\beta = 0$.

Wheel AD. $\mathbf{v}_C = 0, \qquad \mathbf{v}_D = 45 \text{ in./s} \longleftarrow$



$$\omega_{AD} = \frac{v_D}{CD} = \frac{900}{80} = 11.25 \text{ rad/s} \circlearrowleft$$

$$CA = (CD) - (DA) = 80 - 50 = 30 \text{ mm}$$

$$v_A = (CA)\omega_{AD} = (30)(11.25) = 337.5 \text{ mm/s} \longleftarrow$$

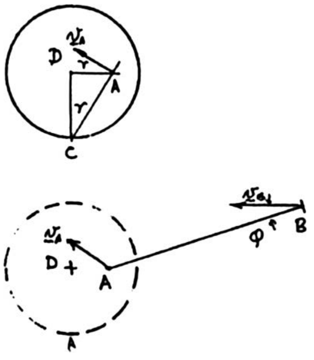
Rod AB. $\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A}$

$$[v_B \longleftarrow] = [337.5 \longleftarrow] + [v_{B/A} \searrow \varphi] \qquad \mathbf{v}_B = 338 \text{ mm/s} \longleftarrow \blacktriangleleft$$

$$v_{B/A} = 0 \qquad \omega_{AB} = 0 \blacktriangleleft$$

(*b*) $\beta = 90°$.

Wheel AD. $\mathbf{v}_C = 0, \qquad \omega_{AD} = 11.25 \text{ rad/s} \circlearrowleft$



$$\tan\gamma = \frac{DA}{DC} = \frac{50}{80}, \qquad \gamma = 32.005°$$

$$CA = \frac{DC}{\cos\gamma} = 94.34 \text{ mm}$$

$$v_A = (CA)\omega_{AD} = (94.34)(11.25) = 1061.3 \text{ mm/s}$$

$$\mathbf{v}_A = [1061.3 \text{ mm/s} \nwarrow 32.005°]$$

Rod AB. $\mathbf{v}_B = v_B \longleftarrow$

$$\sin\varphi = \frac{80}{250}, \quad \varphi = 18.663°$$

Plane motion = Translation with A + Rotation about A.

PROBLEM 15.73

A juggling club is thrown vertically into the air. The center of gravity G of the 20 in. club is located 12 in. from the knob. Knowing that at the instant shown G has a velocity of 4 ft/s upwards and the club has an angular velocity of 30 rad/s counterclockwise, determine (a) the speeds of Point A and B, (b) the location of the instantaneous center of rotation.

SOLUTION

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft$

Relative positions: $\mathbf{r}_{A/G} = -(1\text{ ft})\mathbf{i}, \quad \mathbf{r}_{B/A} = \left(\dfrac{8}{12}\text{ ft}\right)\mathbf{i}$

Angular velocity: $\boldsymbol{\omega} = 30\text{ rad/s} \circlearrowleft = (30\text{ rad/s})\mathbf{k}$

Velocity at A:

$$\begin{aligned}
\mathbf{v}_A &= \mathbf{v}_G + \mathbf{v}_{A/G} = \mathbf{v}_G + \boldsymbol{\omega} \times \mathbf{r}_{A/G} \\
&= (4\text{ ft/s})\mathbf{j} + (30\text{ rad/s})\mathbf{k} \times (-1\text{ ft})\mathbf{i} \\
&= (4\text{ ft/s})\mathbf{j} - (30\text{ ft/s})\mathbf{j} = -(26\text{ ft/s})\mathbf{j} \\
&= 26\text{ ft/s} \downarrow
\end{aligned}$$

$v_A = 26.0\text{ ft/s}$ ◀

Velocity at B:

$$\begin{aligned}
\mathbf{v}_B &= \mathbf{v}_G + \mathbf{v}_{B/G} = \mathbf{v}_G + \boldsymbol{\omega} \times \mathbf{r}_{B/G} \\
&= (4\text{ ft/s})\mathbf{j} + (30\text{ rad/s})\mathbf{k} \times \left(\frac{8}{12}\text{ ft}\right)\mathbf{i} \\
&= (4\text{ ft/s})\mathbf{j} + (20\text{ ft/s})\mathbf{j} = (24\text{ ft/s})\mathbf{j} \\
&= 24\text{ ft/s} \uparrow
\end{aligned}$$

$v_B = 24.0\text{ ft/s}$ ◀

Let $\mathbf{r}_{C/G} = x\mathbf{i}$ bet the position of the instantaneous center C relative to G.

$$\begin{aligned}
\mathbf{v}_C &= \mathbf{v}_G + \mathbf{v}_{C/G} = \mathbf{v}_G + \boldsymbol{\omega} \times (x\,\mathbf{i}) \\
&= (4\text{ ft/s})\mathbf{j} + (30\text{ rad/s})\mathbf{k} \times (x\,\mathbf{i}) \\
&= (4\text{ ft/s})\mathbf{j} + (30\text{ ft/s})\,x\,\mathbf{j} = 0
\end{aligned}$$

$$x = -\frac{4\text{ ft/s}}{30\text{ rad/s}} = -\frac{4}{30}\text{ ft} = -1.6\text{ in.}$$

Point C lies 1.6 in. to the left of G. ◀

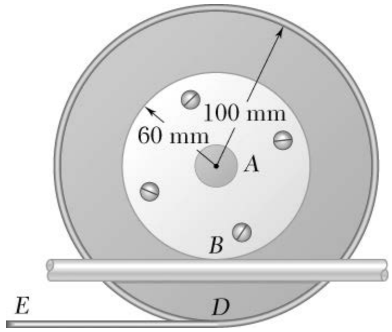
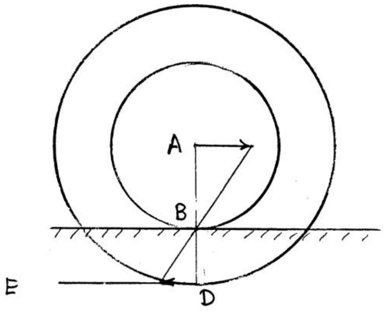
PROBLEM 15.77



A 60-mm-radius drum is rigidly attached to a 100-mm-radius drum as shown. One of the drums rolls without sliding on the surface shown, and a cord is wound around the other drum. Knowing that end E of the cord is pulled to the left with a velocity of 120 mm/s, determine (a) the angular velocity of the drums, (b) the velocity of the center of the drums, (c) the length of cord wound or unwound per second.

SOLUTION



Since the drum rolls without sliding, its instantaneous center lies at B.

$$\mathbf{v}_E = \mathbf{v}_D = 120 \text{ mm/s} \longleftarrow$$

$$v_A = r_{A/B}\omega, \; v_D = r_{D/B}\omega$$

(a)
$$\omega = \frac{v_D}{r_{D/B}} = \frac{120}{100-60} = 3 \text{ rad/s}$$

$$\boldsymbol{\omega} = 3.00 \text{ rad/s} \circlearrowright \blacktriangleleft$$

(b)
$$v_A = (60)(3.00) = 180 \text{ mm/s}$$

$$\mathbf{v}_A = 180 \text{ mm/s} \longrightarrow \blacktriangleleft$$

Since $\mathbf{v}_A$ is to the right and $\mathbf{v}_D$ is to the left, cord is being unwound.

$$v_A - v_E = 180 + 120 = 300 \text{ mm/s}$$

(c) Cord unwound per second $= 300$ mm ◀

PROBLEM 15.78

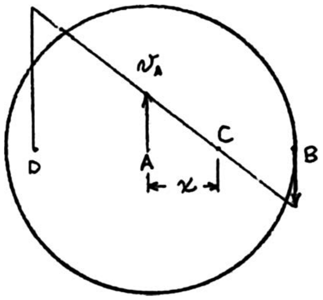
The spool of tape shown and its frame assembly are pulled upward at a speed $v_A = 750$ mm/s. Knowing that the 80-mm-radius spool has an angular velocity of 15 rad/s clockwise and that at the instant shown the total thickness of the tape on the spool is 20 mm, determine (*a*) the instantaneous center of rotation of the spool, (*b*) the velocities of Points *B* and *D*.

SOLUTION

$$\mathbf{v}_A = 750 \text{ mm/s}\uparrow$$

$$\omega = 15 \text{ rad/s} \circlearrowright$$

$$x = \frac{v_A}{\omega} = \frac{750}{15} = 50 \text{ mm}$$



(*a*) The instantaneous center lies 50 mm to the right of the axle. ◀

$$CB = 80 + 20 - 50 = 50 \text{ mm}$$

(*b*) $v_B = (CB)\omega = (50)(15) = 750$ mm/s

$$\mathbf{v}_B = 750 \text{ mm/s}\downarrow \quad ◀$$

$$CD = 80 + 50 = 130 \text{ mm}$$

$$v_D = (CD)\omega = (130)(15) = 1950 \text{ mm/s}$$

$$\mathbf{v}_D = 1.950 \text{ m/s}\uparrow \quad ◀$$

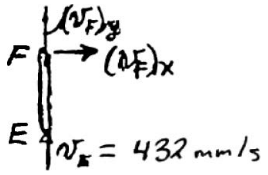
PROBLEM 15.90

Two slots have been cut in plate *FG* and the plate has been placed so that the slots fit two fixed pins *A* and *B*. Knowing that at the instant shown the angular velocity of crank *DE* is 6 rad/s clockwise, determine (*a*) the velocity of Point *F*, (*b*) the velocity of Point *G*.

SOLUTION

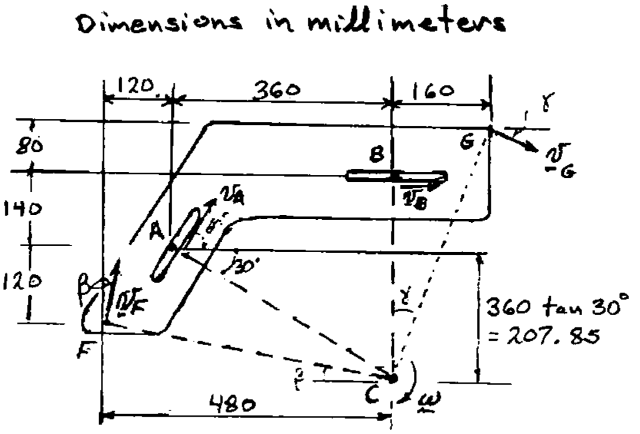
Crank *DE*: $v_E = (DE)\omega_{DE} = (72 \text{ mm})(6 \text{ rad/s})$

$\mathbf{v}_E = 432 \text{ mm/s} \uparrow$



Rod *EF*: $(v_F)_y = v_E = 432 \text{ mm/s} \uparrow$

Plate *FG*:



$\mathbf{v}_A$ and $\mathbf{v}_B$ are velocities of points on the plate next to the pins *A* and *B*. We draw lines perpendicular to $\mathbf{v}_A$ and $\mathbf{v}_B$ to locate the instantaneous center *C*.

(*a*) Velocity of Point *F*:

$$v_F = (CF)\omega$$
$$(v_F)_y = [(CF)\omega]\cos\beta = [(CF)\cos\beta]\omega$$

But $(v_F)_y = 432 \text{ mm/s}$ and $(CF)\cos\beta = 480 \text{ mm}$:

$$432 \text{ mm/s} = (480 \text{ mm})\omega$$
$$\omega = 0.9 \text{ rad/s}$$

$\boldsymbol{\omega} = 0.9 \text{ rad/s}$ ↻

PROBLEM 15.90 (Continued)

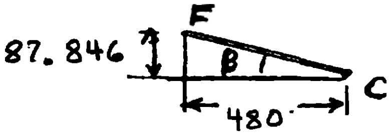
$$CF = 487.97 \text{ mm}$$

$$\beta = 10.37°$$

$$v_F = (CF)\omega$$

$$= (487.97 \text{ mm})(0.9 \text{ rad/s})$$

$$= 439.18 \text{ mm/s}$$



$$\mathbf{v}_F = 439 \text{ mm/s} \measuredangle 10.4°$$

$\mathbf{v}_F = 439$ mm/s $\measuredangle$ 79.6° ◀

(*b*) Velocity of Point *G*:

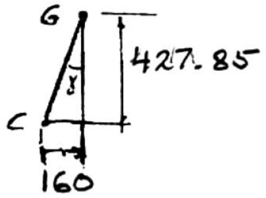
$$CG = 456.78 \text{ mm}$$

$$\gamma = 20.50°$$

$$v_G = (CG)\omega$$

$$= (456.78 \text{ in.})(0.9 \text{ rad/s})$$

$$v_G = 411.11 \text{ mm/s}$$



$\mathbf{v}_G = 411$ mm/s $\measuredangle$ 20.5° ◀

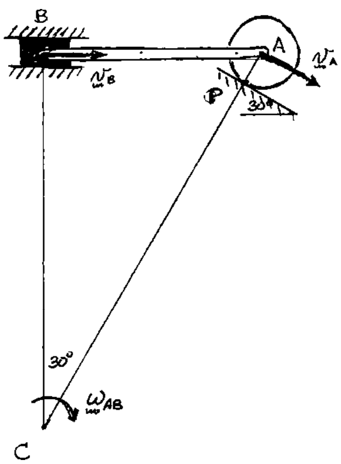
PROBLEM 15.91

The disk is released from rest and rolls down the incline. Knowing that the speed of A is 1.2 m/s when $\theta = 0°$, determine at that instant (*a*) the angular velocity of the rod, (*b*) the velocity of B. Only portions of the two tracks are shown.

SOLUTION

Draw the slider, rod, and disk at $\theta = 0°$.

Let Point P be the contact point between the disk and the incline. It is the instantaneous center of the disk. $\mathbf{v}_A$ is parallel to the incline. So that



$$\mathbf{v}_A = v_A \searrow 30°$$

Constraint of slider:

$$\mathbf{v}_B = v_B \longrightarrow$$

To locate the instantaneous center C of the rod AB, extend the line AP to meet the vertical line through P at Point C.

$$l_{AC} = l_{AB}/\sin 30°$$
$$l_{BC} = l_{AB}/\tan 30°$$

Angular velocity of rod AB.

$$\omega_{AB} = \frac{v_A}{l_{AC}} = \frac{v_A \sin 30°}{l_{AB}} = \frac{(1.2 \text{ m/s})\sin 30°}{0.6 \text{ m}}$$

$$\boldsymbol{\omega}_{AB} = 1.000 \text{ rad/s} \circlearrowright \blacktriangleleft$$

(*b*) *Velocity of Point B.*

$$v_B = l_{BC}\omega_{AB}$$

$$v_B = \frac{l_{AB}}{\tan 30°}\frac{v_A \sin 30°}{l_{AB}} = v_A \cos 30° = 1.2\cos 30°$$

$$\mathbf{v}_B = 1.039 \text{ m/s} \longrightarrow \blacktriangleleft$$

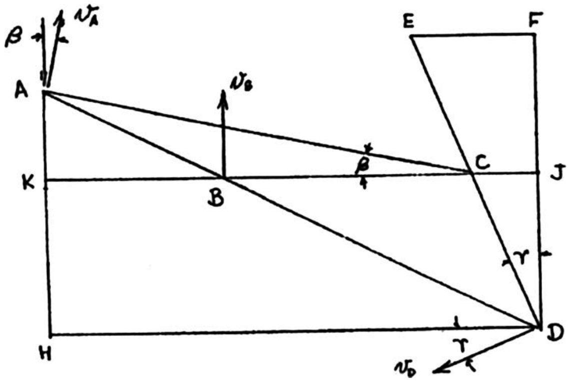
PROBLEM 15.92

Arm *ABD* is connected by pins to a collar at *B* and to crank *DE*. Knowing that the velocity of collar *B* is 400 mm/s upward, determine (*a*) the angular velocity of arm *ABD*, (*b*) the velocity of Point *A*.

SOLUTION



$$\mathbf{v}_B = 16 \text{ in./s} \uparrow \qquad \tan\gamma = \frac{EF}{DF} = \frac{125}{300} \qquad \mathbf{v}_D = v_D \nearrow \gamma$$

Locate the instantaneous center (Point *C*) of bar *ABD* by noting that velocity directions at Points *B* and *D* are known. Draw *BC* perpendicular to $\mathbf{v}_B$ and *DC* perpendicular to $\mathbf{v}_D$.

$$CJ = (DJ)\tan\gamma = (160)\left(\frac{125}{300}\right) = 66.667 \text{ mm}$$

$$CB = JB - CJ = 320 - 66.667 = 253.33 \text{ mm}$$

(*a*) $$\omega_{ABD} = \frac{v_B}{CB} = \frac{400}{253.33} = 1.57895 \text{ rad/s}$$ $\boldsymbol{\omega}_{ABD} = 1.579 \text{ rad/s} \circlearrowright$ ◀

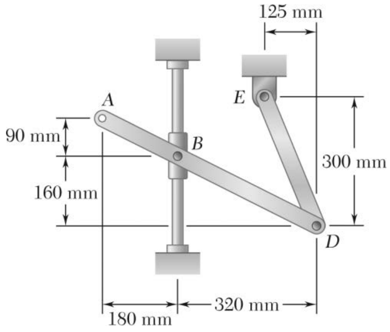
$$CK = CB + BK = 253.33 + 180 = 433.33 \text{ mm}$$

$$\tan\beta = \frac{KA}{CK} = \frac{90}{433.33}, \quad \beta = 11.733°, \quad 90° - \beta = 78.3°$$

$$AC = \frac{CK}{\cos\beta} = \frac{433.33}{\cos 11.733°} = 442.58 \text{ mm}$$

(*b*) $$v_A = (AC)\omega_{ABD} = (442.58)(1.57895) = 699 \text{ mm/s}$$ $\mathbf{v}_A = 699 \text{ mm/s} \measuredangle 78.3°$ ◀

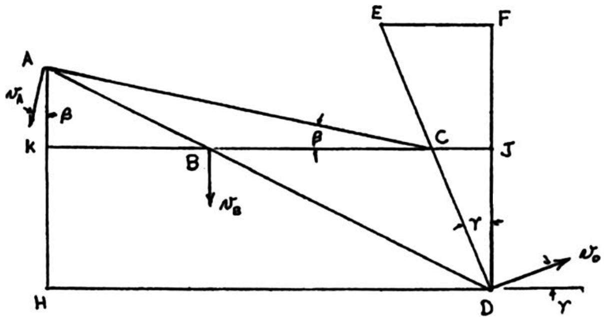
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.93

Arm *ABD* is connected by pins to a collar at *B* and to crank *DE*. Knowing that the angular velocity of crank *DE* is 1.2 rad/s counterclockwise, determine (*a*) the angular velocity of arm *ABD*, (*b*) the velocity of Point *A*.

SOLUTION



$$\tan\gamma = \frac{EF}{DF} = \frac{125}{300}, \quad \gamma = 22.620°, \quad ED = \frac{FD}{\cos\gamma} = \frac{300}{\cos\gamma} = 325 \text{ mm}$$

$$v_D = (ED)\omega_{DE} = (325)(1.2) = 390 \text{ mm/s} \quad \mathbf{v}_D = 390 \text{ mm/s} \measuredangle \gamma$$

$$\mathbf{v}_B = v_B \downarrow$$

Locate the instantaneous center (Point C) of bar ABD by noting that velocity directions at Points B and D are known. Draw BC perpendicular to $\mathbf{v}_B$ and DC perpendicular to $\mathbf{v}_D$.

$$CJ = (DJ)\tan\gamma = (160)\left(\frac{125}{300}\right) = 66.667 \text{ mm}, \quad CD = \frac{DJ}{\cos\gamma} = \frac{160}{\cos\gamma} = 173.33 \text{ mm}$$

(*a*) $$\omega_{ABD} = \frac{v_D}{CD} = \frac{390}{173.33} = 2.25 \text{ rad/s} \circlearrowleft \qquad \omega_{ABD} = 2.25 \text{ rad/s} \circlearrowleft \blacktriangleleft$$

$$CK = KJ - CJ = 500 - 66.667 = 433.33 \text{ mm}$$

$$\tan\beta = \frac{AK}{CK} = \frac{90}{433.33} \qquad \beta = 11.733° \qquad 90° - \beta = 78.3°$$

$$AC = \frac{CK}{\cos\beta} = \frac{433.33}{\cos\beta} = 442.58 \text{ mm}$$

(*b*) $$v_A = (AC)\omega_{ABD} = (442.58)(2.25) = 996 \text{ mm/s} \qquad \mathbf{v}_A = 996 \text{ mm/s} \nearrow 78.3° \blacktriangleleft$$

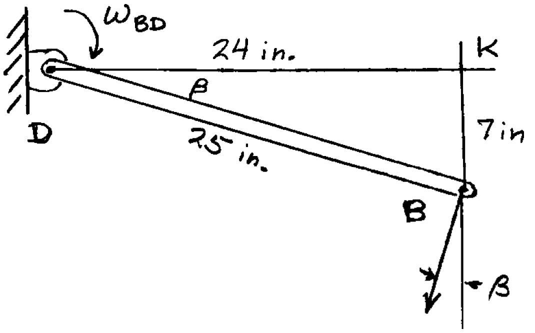
PROBLEM 15.94

Two links AB and BD, each 25 in. long, are connected at B and guided by hydraulic cylinders attached at A and D. Knowing that D is stationary and that the velocity of A is 30 in./s to the right, determine at the instant shown (*a*) the angular velocity of each link, (*b*) the velocity of B.

SOLUTION

Link DB: Point D is stationary. Assume $\boldsymbol{\omega}_{BD} = \omega_{BD}$ ↻.



$v_B = (DB)\omega_{BD}$ $\qquad$ $\mathbf{v}_B$ is perpendicular to DB.

$\tan\beta = \dfrac{7 \text{ in.}}{24 \text{ in.}}$ $\qquad$ $\beta = 16.3°$ $\qquad$ $90° - \beta = 73.7°$

Link AB: Draw the configuration. Locate the instantaneous center C of link AB by noting that the line BC is perpendicular to $\mathbf{v}_B$, i.e., along DB, and that AC is perependicular to $\mathbf{v}_A = v_A \longrightarrow$. ($v_A = 30$ in./s).
